What, therefore, might seem to be the crowning mercy of all would be the possibility of rendering assurances of several years' duration practically non-forfeitable. Before, however, coming to particulars in this respect, it may be observed that the surrenders above-mentioned dealt with two phases of the matter only, viz., (1) cash surrenders of the bonuses of ordinary branch policies, and (2) surrenders of the policies, either by way of cash, or a paid-up policy. The main consideration, however, is that wherever a cash surrender has been possible, this has, in the vast majority of instances, been the accepted alternative. The cause of surrenders or free policies have—again in the vast majority of cases—been brought about through inability to pay the recurrent premiums, and the only alternative has been as stated. Often and often, however, the difficulty has been temporary, and had that period been safely passed without the creation of additional burdens, the probabilities are that the future premiums would have been paid with the same regularity as hitherto, so that when the time of stress had been safely bridged over, renewed confidence, satisfaction and regular payments would once again prevail.

Sometimes, it is true, that loans have been used as a temporary expedient to tide over the difficulty, with in some cases, great advantage; but, as a rule, these only add to the burden, from the

fact that they create a further liability by way of interest; and sooner or later it is realized that, so far from the adopted expedient being a permanent advantage, the difficulty has really been distended without co-relative benefit, and that whilst there has arisen an additional payment, the capital sum assured has been reduced and not enhanced. More often than not, too, a portion of the loan has been utilized in the payment of arrears, and the probabilities are that in most cases a loan would not have been sought, apart from the necessity of paying the overdue premium.

Instead, therefore, of enforcing a loan, with its accompanying interest charge, is it not possible to meet almost every temporary difficulty by a system of credit surrenders of the accrued bonuses, or of the capital sum assured? as this system could be adapted to all classes of assurance, and would have the initial double advantage of wiping off all arrears, and create no new burden by way of interest.

To examine it, however, in regard to industrial branch policies. It is recognized that after a few years—in many instances, five and upwards—nearly all policies now acquire either a small cash surrender value, or free policy value; but to adopt either of those expedients would (as previously noticed) render the policies null and void except to the extent of the free policy value, should that method of surrender, be chosen. To apply the principle of credit surrenders, however, would enable the policyholder to get a credit advance for the payment of all arrears, and with the slight reduction in the amount of the capital sum assured, ensure the policy being kept intact, and guarantee all benefits accordingly. From the fact, however, that substantial free policy values are granted after five years' duration, it would seem to follow that all policies, if not after three years' duration, certainly after five years, would become eligible for credit surrenders. Even now, however, in certain instances, some industrial branch policies acquire surrender value after three years' duration.

Such surrenders, however, should be for the sole purpose of assisting the policyholder to keep the assurance in force, although, obviously, the credit advance could not, in any instance, exceed the cash value of the free policy value which the original assurance had acquired. And a very specific condition of the whole matter should be that under no circumstances whatever should any cash be paid over, but that the advance in every instance should be in the form of receipt for premiums due, and equal only to the amount required for the payment of the entire arrears at any one time. Let me illustrate:

(1) Mrs. Goodwoman, now aged thirty, has a "whole-life" policy at 3d. per week, which has been ten years in force. Hitherto she has been a good payer, but through unforeseen adversity, she has unfortunately fallen into arrears to such an extent that according to the conditions of the policy it must be lapsed forthwith; and unless the agent commits a dereliction of duty, the policy has to be returned for lapsing. Mrs. G., however, has no immediate prospect of paying, and the recent hard times are likely to be prolonged beyond the days of grace; or, even in the most favorable event, it will be impossible for her to revive the assurance. With the policy she, perhaps, has also been paying upon the other members of her family of five, and altogether the premiums are 1s. per week. Her policy, however, has acquired a free policy value approaching £5, which, for the present purpose, might be considered as equal to a present cash value of nearly 30s. But, as she requires only some 10s. to make her book clear, she would not want to trench upon the free policy value to a greater extent than, say, 33s.—the cash value of which would be the required 10s. To save the whole of her assurances, however, she would, doubtless, be most willing and ready to do this, provided she could be given credit for the whole of her arrears, and have her book marked up to date. She is therefore very pleased if this can be done by the reduction of the capital sum assured under her policy to the extent of the afore-mentioned 33s.; and, to safeguard the company as to this, the policy would be endorsed accordingly, so that when a claim occurred, no difficulty whatever in regard thereto would be experienced, as the total sum assured would be carefully worked out, and the deduction made of whatever portion had hitherto been commuted in consideration of the credit surrender.

(2) If the policy had, instead of having been only ten years in force, been, say, fifteen or twenty years in force, and had consequently become entitled to a very substantial bonus, then credit surrender could be obtained in the same way therefrom, and the policy endorsed accordingly; or, for purposes of simple calculation, both the free policy value and the bonus could be conjointly reckoned.

(3) Mrs. Indigent, who is always in needy circumstances, has, as the result of close personal application, tact, and diplomacy, on the part of the agent, been indifferently paying 1s. per week (or the average of 1s. per week) for several years, in respect of her family's assurances. Upon two or three occasions her policies have lapsed, and she has only been able to revive one or two by paying up the arrears. On the last occasion, however, she was unable to do this in respect of either policy, and consequently free policies were obtained in lieu of so much of the business as was eligible therefor. Being imbued, however, with the idea of the necessity of assurance, the whole of her business was re-entered eighteen months since; but by indifferent payments, she has yet once again fallen into arrears, and is now up to the lapsing point. Nothing, therefore, can be done in her case by way of credit surrenders in so far as the existing assurances are concerned, but having several free policies, some portion of one of those may be utilized for the purpose; and, consequently, she is able to obtain the necessary credit surrender up to the desired amount to make her book once again clear; and, to her intense delight, the whole of her present assurances are again placed upon a solid foundation.

And thus the same principle could be applied over and over again, should necessitous circumstances compel, and be indefinitely extended in connection with all policies which have acquired a free policy value. Of course, under endowment assurances, the cash value of the free policy value being greater, smaller amounts would be written off the capital sums assured.

All the time, however, there would be absolutely no incentive for getting into arrear, and every one would have the most lively interest in keeping up to date, as any lack by the policyholders would entail penalities upon themselves.

It will readily be seen that the companies would suffer no loss by the transaction, as, independently of the reduction of the capital sums assured by an equivalent of five per cent compound interest, an enormous saving would be the inevitable result by practically doing away with the unlimited expenses entailed by lapsing, cost of postage, lapse notices, statistical and other most costly work; whilst the duration of the policies would be very greatly increased. And another very important feature would be that nearly, or quite, one-half of the huge sums of outstanding premiums would automatically become available for investment,—a further source of considerable revenue to the companies. Further still, all or nearly all of the contingent expenses of re-entered business would be wiped out, and a vast number of assurers, who having become disheart-

ened by (alleged) losses, lapses, and withdrawals, would be retained in the ranks of the assured, and consequently these would constitute so many more potent influences for the extension and consolidation of the business.

For the complete adaptation of the system, it might very well be that all policies to which an indisputable title could be adduced, should be eligible for credit surrenders by the policyholder, which would include infantile policies under certain ages—unless specifically precluded by the conditions of assurance—and which should be surrenderable for the specific purpose by the parent who had paid the premiums, when such policies had acquired a free policy value.

To me it seems that the setting up of such a system would establish a new era of relationship between the assured and the companies, as at one stroke the companies would—in addition to all previous much-appreciated concessions—give the most powerful manifestation possible of their goodwill towards all assurers and demonstrate—as perhaps nothing else could do—that the all-consuming desire on their part was for the maintenance of all existing assurances until the period of maturity had arrived. Again, the adoption of such a system would forge the greatest instrument of destruction possible against the enemies of industrial assurance, and forever do away with everything in the nature of destructive criticism as to the alleged profits annually totaled by the respective companies from lapsing policies—unfounded and untruthful as these may appear to others better and more fully informed, and who are ever willing to interpret in a liberal spirit the many generous acts of the several companies. And what might be found to prove a greater factor still for the general welfare of the business and induce even more rapid extension of industrial branch assurance would be the incalculable moral effect that the adoption of the system would have in forever doing away with the haunting fear of lapsing, for then every one entering assurance could safely rely upon the fact that after a few years their policies would be practically non-forfeitable.

Any one who has canvassed for new business must know that of obstacles that ever existed to the writing of new proposals, this has ever been the greatest, and that after every other argument had been fully met, answered, and overcome, this one has many and many a time been found to prove the insuperable barrier that neither logic, goodwill, nor common sense could surmount.

Although it has been suggested that only such policies as have acquired a free policy value might be considered in this connection, and the period of qualification in this respect is, in the majority of instances, five years, yet it is felt that by experience, after a few years, the period for credit surrenders might easily be reduced to three years, which the increased prosperity of the companies would make possible. As, however, the main idea is to keep all policies in force the condition must be repeated that under no circumstances whatever should the commutation of the free policy value for cash be permitted in this connection, and the concession should, in every case, be by way of credit note to the respective agent, who would enter the respective amount in the receipt book, and be so certified also by the superintendent, who would also obtain the necessary receipt to forward to the chief office of his company.

With such a system in full operation the necessary machinery would at once be at hand for readily and effectually dealing with such exceptional conditions as, unfortunately, are experienced in the large industrial and commercial centres during periods of strikes, lock-outs, etc. And who could rightly appraise the enormous advantage accruing from being able to effectually prevent at least 80 to 85 per cent of the lapses entailed by the loss of wages at such times, and thus prevent the abnormal waste in energy and the heavy expenses now experienced in those connections.

Of course, the whole scheme would need special instructions and conditions; but as to the probability of a thoroughly sound and workable scheme being devised, I have no doubt whatever, after the respective actuaries had drafted the requisite tables. And, to my mind, the early tangible and continuous results would be (1) an automatic reduction in the capital liabilities of the companies, (2) free policies would be practically unknown in regard to future business, and all the attendant worry, loss, and anxiety in respect of them in the future would be unknown, and consequently the energy expended in that direction in the past could henceforth be devoted to better purpose, and (3) there would be an ever-satisfied clientele, for the simple but sufficient reason that all would ever be in possession of the utmost values obtainable in respect of past and present payments, and, *inter alia*, (4) general stability and contentment would inevitably and permanently prevail, after the same manner as now obtains where payments can be regularly kept up.

I do not claim to have discovered a new heaven and new earth, nor do I say that a contingent consideration has never entered into the heart of man; but, at any rate, here, I firmly believe, is the nucleus or a practical solution of a question which has disturbed the equilibrium of insurance workers for half a century or more.

It is hoped the scheme will commend itself to the favorable consideration of the respective companies, notwithstanding the fact that it has not emanated from the usual seat of authority. And, although some may still prefer to still adhere to the old cast-iron rules and conditions which force the lapsing of policies, with all the attendant drawbacks, yet it is sincerely hoped this will not be the universal attitude adopted; for if there is anything in the usually accepted dictum that lapses mean incalculable loss to the companies, then here are the outlines of a scheme that will speedily obviate that loss, and should therefore be hailed with avidity by the companies, and with the same unanimity as I believe it would be hailed and rejoiced in by all practical insurance men in the country, who daily and hourly come into contact with the millions of industrial branch policyholders.

The fact may also be recognized that in certain circles some of the best inventions have come from other sources than the office, the management and the directorate, and whilst it is ever known that such inventions are at the first perhaps viewed with some coldness, suspicion or scepticism, yet after a while they gradually win their way to favor, are seriously entertained, and are eventually adopted. In this particular instance, however, sound data exists for the conclusions reached, and it is therefore sincerely hoped that no great lapse of time may be suffered to pass before the suggested evolution in industrial branch assurance may become a realized fact.

If, however, I may be permitted to make a request, it is that the columns of the "Commercial World" may be thrown open to as large an extent as possible for further expressions of opinion on the matter.

Thus, for the moment, Mr. Editor, it only remains for me to thank you for the space so generously granted, and to fervently hope that in this instance, as in so many others in the past, it will be found that the "Commercial World" has proved a most valuable ally in the promulgation of a scheme which (as before observed) will, I am persuaded, if adopted, ultimately prove to be one of the most far-reaching and beneficial ever contemplated in the realm of industrial assurance.

To add permanence to its foundations, and to usher in this glorious dawn are the only interests I desire to subserve by this article.

OFFICIAL STATISTICS SHOW THAT FRENCH INDUSTRIAL ACCIDENTS REACHED A NEW HIGH RECORD IN 1912

THE governmental statistics showing the number and character of industrial accidents covered by workmen's compensation laws are slow to make their appearance in all European countries, and, in fact, are generally from one to three years behind date None the less, they are, where they appear, of the greatest importance to students of the subject,—whether they be legislators, commissions or liability insurance men,—in the United States, where we are impulsively passing workmen's compensation laws in State after State, with little exact knowledge to guide those who frame the laws.

More than a year ago [THE MARKET WORLD AND CHRONICLE, January 18, 1913], this paper published a translation of the summary and comment of the French insurance journal, "L'Argus," upon the report of the French Minister of Labor and Social Providence, containing the statistics of industrial accidents in France during 1911. The same journal has now issued a similar summary of the report of the same Minister on French industrial accidents in 1912. The striking fact brought out by the report is that there is virtually no cessation of the disproportionate increase in the number of such accidents from year to year, despite the fact that the growth of the French industrial population, like that of the French population as a whole, is almost negligible. Since 1903, the number of industrial accidents per 1,000 workers in France had in 1912 almost doubled; and in 1912 for the first time the ratio rose above 100 accidents per 1,000 workers,—to be exact, to 108.5 per 1,000, as compared with 99.1 per 1,000 in the previous year. The proportion of accidents causing death and of those causing permanent disability undergoes little change; but the minor accidents calling for compensation and medical expense rise beyond all belief. As the matter is excellently summarized by "L'Argus," it is well to give in translation what that journal has to say about it. The summary is as follows:

* * *

We have before us the latest statistics published by the Minister of Labor and Social Providence, in his report upon the administration during 1912 of the law of June 12, 1893-July 11, 1903, regarding the hygienic conditions and the safeguarding against accidents of industrial workers in France. Once again there is shown in all districts of the country and in almost every branch of industry an increase in the number of accidents, which must be singularly perplexing to the insurance carriers who cover these risks. In fact, the total number of accidents reported in 1912 reached no less a figure than 589,314, as compared with 534,650 in 1910. The increase from 1910 to 1912 was therefore 54,664 accidents, or 10.22 per cent.

Presented boldly thus these figures are insufficient to afford definitive conclusions; for if the number of workers and salaried employes had increased, it might naturally follow that the increase of the number of accidents was simply proportionate to that of the persons exposed. This is clear enough and the striking fact does not lie here. What is particularly serious is the proportion per 1,000 workers of the number of accidents, which grows largely from year to year, as may be seen by the following table:

Number of Accidents Per 1,000 Workers in the Different Branches of Industry.

Year.	Accidents Per 1,000 Workers.	Year.	Accidents Per 1,000 Workers.
1903	54.9	1908	77.9
1904	52.8	1909	82.9
1905	61.3	1910	87.2
1906	70.7	1911	99.1
1907	80.1	1912	108.5

The distribution of the industrial accidents reported, as between the various occupational groups, is given in Table A, appended to this article.

The question now arises as to what may be the cause of this increase in the absolute and in the relative number of accidents which goes from bad to worse with every succeeding year. The answer is that the increase is found solely in the accidents causing temporary disability. The Minister of Labor has something to say upon this point, and this is what it is:

"As regards the fatal accidents and those resulting in a permanent disability, the figures of the successive years show only fluctuations, without any continuous tendency towards an increase; on the contrary, the category of accidents that have given rise to a temporary disability accounts, so to speak, for the entire increase found in the total number of reported accidents.

"Now, it is above all as regards this category of accidents that the increase in the relative number of accidents reported is affected by the more or less widespread knowledge of the advantages that may be derived from the law. From the beginning, the serious

Corrected figures.

accidents have been reported with a decided regularity of occurrence. On the other hand, in the earlier period of the operation of the law, when it was a question of slight accidents likely to occasion merely inability to work for a short space of time, those concerned often neglected to make any report at all about them. This inattention tends naturally to disappear in proportion as those concerned become familiar with the operation of the law and grow to know better the benefits for themselves which they may derive from it.

"Accordingly, it is more than probable that the figures cited above disclose rather an increase of the reports of accidents than a growth of the accident risk itself."

The second table which we give (Table B) indicates the proportion of accidents per 1,000 workers in the several occupational groups and the consequences resulting from the accidents, whether death, permanent disability or temporary disability. It is easy to see from the figures that, while the severe accidents maintain fairly constant in number, just the reverse is the case for the accidents causing temporary disability.

And now we would particularly call to the attention of the insurers of industrial accident risks the following words of the Minister of Labor, already quoted above:

"This inattention (to making reports of slight accidents) tends naturally to disappear in proportion as those concerned become familiar with the operation of the law and grow to know better the benefits for themselves which they may derive from it."

In this very statement, in fact, is to be found the weak side of a law, for which it is hard indeed to apply a remedy. There is nothing more natural or more legitimate than for a workingman to assert his rights in proportion as he becomes better acquainted with a law which is so favorable to him. But how great is the number of those workers who take advantage of the slightest accident in order to exaggerate its severity! How many there are who are almost pushed in this direction by culpable shutting of the eyes to abuses! This is the kind of thing that fails to be apparent in the statistics; but there is no one familiar with the matter who does not know that cases of this kind unhappily are very abundant.

It is impossible for the insurers to prevent altogether fraud and simulation in industrial accident cases. Nevertheless, every time they discover the one or the other, it is their bounden duty to make it public and to have it punished. Otherwise the contagion of example would be such that one cannot avoid asking oneself the question whether it would long be possible for the insurers to cover at all the risks which they are now underwriting in this field.

THE PROGRESS OF LIVE STOCK INSURANCE IN BELGIUM*

IN West Flanders live stock insurance has been compulsory since 1837, and entitles to compensation for losses due to slaughter of live stock ordered by the public authorities and the rejection of the meat as unsuited for consumption.

In 1911 the business done by the West Flanders Compulsory Live Stock Insurance Fund was as follows (franc = 19.5 cents):

NUMBER OF HEAD OF LIVE STOCK INSURED.

Horned cattle, three months or more old	290,017
Horses, one year or more old	40,753
Sheep, three months or more old	16,077
Mules, one year or more old	2,083
Asses, one year or more old	413
Total	349,343

AMOUNT OF PREMIUM.

Horned cattle	72,926.50	at the rate of 0.25 fr. per head, three months old or over.
Horses	20,777.50	at the rate of 0.50 fr. per head, one year old or over.
Sheep	637.95	at the rate of 0.03 fr. per head, three months old or over.
Mules	621.60	at the rate of 0.30 fr. per head, one year old or over.
Asses	61.65	at the rate of 0.15 fr. per head, one year old or over.
Total	95,025.20	

AMOUNT OF CLAIMS PAID.

	Francs.
For 488 horses (maximum 60 fr)	28,996.50
For 1,753 head of horned cattle (ordinary cases)	135,307.58
For 1 head of horned cattle (tuberculosis, supplementary compensation)	9.35
For 63 head of horned cattle (anthrax, supplementary compensation)	1,789.12
For 170 head of horned cattle (aphthous fever, supplementary compensation)	2,749.88
For 28 mules (maximum 20 fr.)	395.00
For 7 asses (maximum 20 fr.)	140.00
For 155 sheep	1,396.25
For 2,657 head of live stock in all	170,783.68

On January 1, 1912, the fund amounted to 1,554,575.94 francs.

In the Province of Antwerp there is a Voluntary Live Stock Insurance Fund, to which 4,252 farmers belonged in 1911, who had insured 12,208 head of horned cattle for 5,206,225 francs. The amount paid in claims was 143,448 francs.

In the other Provinces live stock are insured by local mutual

Summary for all industries subject to the Inspection of the Department of Labor																		

societies, generally paying compensation to the amount of two-thirds of the value of the animals lost.

In West Flanders and the Province of Antwerp such societies form a useful supplement to the above funds.

We shall now give some information in regard to the insurance of the various kinds of animals.

(a) Insurance of Horned Cattle.

Voluntary horned cattle insurance made considerable progress in 1911. On December 31 of that year there were in Belgium 1,339 mutual societies (1,266 of them recognized societies), with altogether 115,246 members. They insured 320,605 head of horned cattle for an amount of 119,604,026 francs.

The losses in the year were 9,444. In 1,486 cases Government gave compensation to a total amount of 160,541 francs. In addition to the Government assistance and the proceeds from the sale of live stock, the total claims paid by the societies amounted to 1,555,441 francs. The amounts received from members (premiums, entrance fees, etc.) in 1911 came to 1,028,269 francs. The assets of the societies on December 31 of that year amounted to 1,192,745 francs.

The 1,339 societies were distributed as follows in the various Provinces: East Flanders, 278; Brabant, 237; Limbourg, 173; Antwerp, 143; Liège, 131; Luxembourg, 120; Namur, 109; Hainaut, 92; West Flanders, 56. Most of the local mutual societies are united in Federations or Provincial reinsurance societies. There were sixteen of such federations doing business in 1911. The following table gives a summary of their transactions for that year:

	Totals.
Number of local societies affiliated to the federations	927
Number of cattle insured by local societies	247,280
Amount of compensation granted by federations (francs)	429,195
Working expenses of federations (francs)	15,067
Amount of premiums paid by societies to reinsurance societies (francs)	252,155
Subsidies from the Provinces (francs)	52,204
Subsidies from the Government (francs)	162,707
Surplus of federations on December 31, 1911 (francs)	365,305

Of 1,266 legally recognized mutual societies as shown above, 9.27 or 73.22 per cent were reinsured.

(b) Farm Horse and Stallion Insurance.

Farm horses were insured in Belgium in 1911 by 250 recognized mutual societies, with 33,344 members, distributed as follows according to Province; East Flanders, 51; Brabant, 44; Limbourg, 43; West Flanders, 40; Antwerp, 31; Luxembourg, 19; Liège, 13; Hainaut, 7; Namur, 2. They insured 68,855 horses of a total value of 64,035,820 francs.

The number of losses in the year was 1,920 and the amount paid in claims was 982,006 francs. Premiums had been collected to the amount of 995,138 francs. On December 31 the assets of these societies amounted to 792,589 francs.

Like the mutual horned cattle insurance societies these we are now considering also reinsure to a large extent. And in fact of the 250 mutual societies existing 242 were reinsured, distributed in 11 federations. These 242 societies had altogether reinsured 51,958 horses, for an amount of 254,303 francs, to which must be added 23,176 francs, in provincial subventions, and 157,260 francs, Government subvention. In the same year these federations paid claims to their members to the amount of 435,864 francs.

It must, finally, be mentioned that at the same date there were in Belgium 7 mutual stallion insurance societies with 743 members, insuring 1,007 stallions for an amount of 3,820,600 francs. In the year there were 27 losses, for which the societies had to pay 98,475 francs in claims to members from whom they had collected premiums to the amount of 59,499 francs. On December 31, 1911, the total assets of these societies amounted to 133,004 francs.

(c) Goat Insurance Societies.

In 1911 there were 494 goat insurance societies, most of them in East Flanders (216) and West Flanders (195). They had 47,560 members and had insured 63,785 head for an amount of 1,240,383 francs.

In the year there were 4,934 losses, for which the societies had to pay 47,810 francs in compensation to members from whom they had collected in premiums 39,794 francs.

These risks also are reinsured by 479 societies, united in 5 federations.

(d) Pig Insurance Societies.

This branch of insurance is less common. From the statistical report we see that there were only 149 mutual societies of the kind, insuring 23,695 pigs, belonging to 11,994 members. There are also pig reinsurance societies. In 1911 there were six, to which 128 societies were affiliated.

NOTES ON INSURANCE, AMERICAN AND FOREIGN

Strike Insurance in Germany.—So-called strike insurance, writes Vice-Consul General D. C. Poole, Jr., of Berlin, has been developed in Germany by employers' protective associations. It is not written by companies organized for profit and doing business under the insurance laws of the Empire.

In some cases it is not insurance, properly conceived, at all, but consists only in the possible receipt by those who suffer damage through labor disturbances of indemnities from the treasury of the association to which they belong The amount of the indemnity is fixed in accordance with the merits and exigencies of each case. Of the 198 employers' organizations engaged with strike insurance at the end of 1911, fifty offered it in this form: Seventy-seven paid cash indemnities in accordance with definite rules set down in their by-laws, fifty-four belonged to central unions offering insurance facilities, and seventeen maintained insurance societies of their own.

These societies, which are voluntary organizations subsidiary to the associations which maintain them, do a real insurance business. They are organized on the mutual system. The following statement of their usual conditions and premiums is taken from Manes' "Versicherungslexicon, Ergänzungsband für die Jahre 1908 bis 1912 (Tübingen, 1913)":

The premium amounts as a rule to at least one-half per mille, most often to 1 per mille of the sum of the wages paid. In nearly all cases the right to increase the premium up to 3 per mille is provided for. As indemnity in the case of justified strikes 25 per cent of the average sum of the wages paid daily to the laborers, or 1 per mille of the year's wages, or 1 mark (23.8 cents) per day and laborer, or 10 per cent of the week's wages, is paid, generally for an unlimited time, but in some instances only for a limited period—for example, 100 days. In all cases the per cent of the indemnity payments diminishes with the number of the striking and locked-out laborers. For example, 20 per cent per laborer and strike day of the average daily wages is paid if not more than twenty laborers are striking; 17½ per cent if from twenty-one to fifty; and 15 per cent if more than fifty.

The determination of the question whether or not a strike is justified, that is, whether or not the employer is justified in the position he has taken with reference to the point or points at issue, is universally left to the decision of a committee of his fellow-employers in the same branch. The organization of these committees is variously regulated. The insurance extends to damage to movable and immovable property, general expenses continuing

during a strike, loss of profits in consequence of a strike, similar losses so far as they may be brought about by the reaction of strikes abroad, and to diminution in the worth of stock on hand or of output, as the case may be.

An attempt was made in 1910 to secure statistics as to the incomes and expenditures of the seventeen insurance societies referred to. Only four made returns. The aggregate receipts of these four were $62,600 and their expenditures $39,500. The capital assets of six societies which made returns as to this feature of their business totaled $135,700 at the end of 1910.

The development of strike insurance runs parallel with the history of the employers' associations which have created it. Begun in Hamburg following labor troubles in the early 70's it spread elsewhere, always in the wake of serious strikes, attaining its present stage of development in the first decade of this century. In 1904 two central unions of employers' associations were formed, the Hauptstelle deutscher Arbeitgeberverbände and the Verein deutscher Arbeitgeberverbände (Headquarters and Union, respectively, of German Employers' Associations). The Union made the creation of strike insurance societies one of its special aims and soon organized a central reinsurance office. The Headquarters adopted a contrary policy at the outset, leaving the matter of strike insurance to its constituent associations. As a demand for reinsurance facilities grew, however, a reversal occurred, and in 1906 the Schutzverband für Streikschäden (Protective Union for Strike Damages) was formed. Some fifty-three organizations interested in strike insurance now adhere to it, among which the textile industry is most largely represented.

The 198 organizations maintaining strike insurance arrangements of one kind or another at the end of 1911 embraced 47,000 employers giving work to 2,300,000 laborers. The largest percentage (37.6) of the employers was in the building trades. In the metal trades, however, the highest percentage of laborers was employed by insured employers, namely, 26.7 per cent of all the laborers in this branch.

Tendency to Revert to Voluntary Social Insurance in England.—On July 9 Sir Richard Cooper, M. P. for Walsall, introduced into the House of Commons a bill of eighty clauses, entitled the Voluntary National Insurance Bill, says the "Insurance Record," of London, which has for its object the repeal of the compulsory insurance act and the substitution of a State-aided voluntary scheme. The bill is intended to secure common freedom for the workers, to re-establish the Truck Acts, and to restore self-government and the spirti of voluntary co-operation to the friendly societies and trade unions of the country. Its chief features are:

1. It makes insurance on the part of the workers entirely voluntary.
2. It restores self-government and responsibility to the friendly societies and trade unions.
3. It holds out inducements to the workers to become insured by offering subsidies derived from taxation.
4. It provides special relief for the low-paid workers.
5. It abolishes the Post Office depositors by providing a special "Associate" section in the approved societies.
6. It abolishes the stamps, cards, and deductions from wages.

Under the new bill any person over sixteen and earning less than £160 a year, whether an employer, wage-earner, or independent worker may be insured by paying a weekly contribution of 3d. or 4d. to an approved society, in return for which he will receive benefits similar to those of the present act, but the administration of those benefits will be left to the friendly societies and trade unions. These approved societies will be invited to form separate sections for the uninsurable lives now in the Post Office, who will be known as "associate members," and receive slightly reduced benefits which will be guaranteed by the State.

Any adult member of an approved society earning less than 14s. a week will be entitled to free insurance, while those earning less than a guinea a week and having dependents can obtain the benefits for one penny a week. Consumptives will be dealt with in a further bill to be introduced later.

The administration of unemployment benefit is removed from the control of the labor exchanges and entrusted to associations of workmen to be formed for the purpose, and to bodies already in existence, such as trade unions.

Provision is made to reduce the number of officials and to replace the four commissions by one responsible body. The largest possible amount of self-government as regards rules, valuation, benefit, etc., is restored to the friendly societies and trade unions, State interference being strictly limited.

Persons wishing to be insured will make their own payments to their own societies. Employers will be relieved of the task of collecting taxes from their workers, and will no longer be entitled to deduct from wages or insist on the production of a card.

The subsidy will be raised in part through the ordinary channels of taxation and in part by a system of licenses to be taken out by employers in respect of each person employed. The duty will be less than the amount of the present employers' tax and will be payable direct to the State on similar lines to the man-servant tax.

Every effort has been made to simplify the change from the compulsory to the voluntary system and those at present insured will have the choice of continuing their insurance or of receiving suitable compensation should they wish to withdraw from the scheme.

* * *

Fire Reinsurance in the United States, 1903 and 1913.—Figures compiled and published by the "Western Underwriter," of Chicago, show that agency fire insurance companies reporting to the New York Insurance Department had reinsured in admitted companies, both reinsurance and agency companies, 17.25 per cent of the business in force at the end of 1913, making present net retentions 82.75 per cent. Ten years ago, in 1903, agency companies reporting to the same department had reinsured 11.16 per cent of the business in force.

The total premiums in force of agency companies in 1913 were $608,034,801 and in 1903 $310,940,401. In 1903 $34,688,101 in premiums was reinsured, while in 1913 reinsured premiums amounted to $104,862,205, an increase of $70,174,104. Not all of the business was in reinsurance companies, of course. Some was peddled over the counter to other agency companies, some of it went to other agency companies via reinsurance bureaus and some went to other agency companies by treaties. The increase in reinsurance, proportionate to the increase in business, has thus been 54 per cent in ten years. The actual increase in business reinsured, however, has been 202 per cent, while the actual increase in total business written by agency companies has been 96 per cent. Put in a different way the amount of premiums on reinsured business has just about tripled in ten years while the total business of agency companies has not quite doubled.

As might, perhaps, be expected, foreign agency companies show a larger percentage of business reinsured than American agency companies. American companies, in 1913, reinsured $76,322,175, or 16.28 per cent, out of total premiums in force of $468,936,722, against $23,897,340, or 10.56 per cent, out of total premiums in force of $226,365,587 in 1903. Foreign companies in 1913 ceded $28,540,030, or 20.51 per cent, out of premiums in force of $139,-

098,079, and in 1903 ceded $10,790,761, or 12.76 per cent, out of $84,574,814.

* * *

Final Figures of the New York Insurance Deaprtment on "Miscellaneous" Companies.—Part III of the annual report of the State Insurance Department was issued on August 24 by Superintendent of Insurance Hasbrouck. This volume covers the financial statements of the general Casualty, Credit, Fidelity and Surety and Real Estate Title and Mortgage Guarantee Companies operating in New York State, for the year ended December 31, 1913. In several instances the results of regular departmental examinations made as of December 31 have been substituted in place of companies' returns; this, for the reason, that such examinations are in the nature of things much more thorough than any mere office audit could be and therefore more nearly reflect the actual financial condition of a company from a departmental standpoint.

A comparison of the figures contained in this volume with those of the pamphlet of preliminary tables published by the department early in April last and prior to the audit of the statements shows that a number of material changes have resulted from such audit.

The appended comparative tabulation gives the results of the business for 1912 and 1913:

CASUALTY, CREDIT, FIDELITY AND SURETY COMPANIES.

	1912.	1913.
Assets	$162,406,391	$169,773,657
Reserves for unpaid losses	$26,499,309	$28,487,667
Unearned premium reserve	50,105,192	52,941,394
Other liabilities	12,132,371	11,939,810
Total liabilities except capital	$88,736,872	$93,368,871
Capital stock	38,342,525	43,100,275
Surplus	35,326,994	33,304,511
Premiums	$110,951,393	$122,430,764
Other income	11,174,181	13,966,770
Total income	$122,125,574	$136,397,534
Claims paid policyholders	$43,197,657	$53,984,837
Shareholders dividends	5,864,307	5,877,806
Expenses	60,023,009	68,657,791
Total disbursements	$109,090,973	$128,520,434

TITLE AND MORTGAGE GUARANTEE COMPANIES.

Assets	$52,410,263	$99,684,805
Liabilities except capital	15,906,861	46,723,447
Capital stock	19,759,271	24,834,400
Surplus	16,744,131	28,126,958
Income	6,865,593	10,291,035
Disbursements	5,859,445	10,146,375

Insurance in Finland in 1912.—From the recently published Official Year Book of Insurance in Finland, it is possible to compile the following summary of the total premiums paid in Finland in 1912 in respect to the various branches of insurance (1 mark equals 19½ cents):

Class of Business.	Finnish Companies (m).	Foreign Companies (m).
Life and annuity	21,120,319	1,628,768
Accident	1,980,546	82,177
Fire	7,955,000	1,141,316
Marine	1,580,478	254,248
Glass	32,724	2,448
Live stock	367,872	.....
Burglary	27,353	.....
Strike	203,350	.....
Fidelity guarantee	944	.....
Totals	33,268,586	3,108,957

* Figures for four large mutual companies. There are also 105 small local mutuals for which figures are not available.

In reviewing the statistics it must be borne in mind that, except where otherwise stated, the figures are gross, and that, as the Russian companies are exempt from rendering returns to the Finish Government, the actual figures of these latter cannot in the generality of cases be included.

* * *

What the World's Insurance Congress May Well Discuss.—President Forrest F. Dryden, President of the Prudential Insurance Company of America, at the request of Commissioner Hathaway, who is to be in charge of the World's Insurance Congress to be held next year in connection with the Panama-Pacific International Exposition in San Francisco, has prepared a brief article, upon the matters which should be made the main topics of discussion at the meetings of the Congress. The suggestions of President Dryden are chiefly in the direction of having the Congress give its attention preponderantly to the economic, social, political and educational side of insurance, rather than to the technical matters concerning primarily the several branches of insurance themselves or to the business of insurance in its several forms. President Dryden says, in part:

* * *

The present occasion suggests a few subjects which can properly receive special consideration on the part of the World's Insurance Congress, and in connection with the discussion of which the foremost authorities might express judgment for the betterment of conditions under which the business can be developed to a still higher degree of usefulness in the years to come.

First: The subject of taxation of insurance, as a social and economic problem, should receive the unqualified attention not only of men familiar with the practice of insurance, but also of economists and those versed in the intricacies of public finance. The amount paid in taxes, licenses and fees by life insurance companies alone in 1912 was $15,000,000, equivalent to 2.24 per cent of the premium receipts.

Second: The commercial aspects of insurance should be brought out, in a thorough study of every phase of insurance activity, along new lines, so as to establish beyond a question of reasonable doubt that, as a matter of fact and historical experience, insurance is, and always has been, an integral element of commerce in the commercial relations of all mankind.

Third: The more effective and comprehensive supervision of new forms of insurance, based, possibly, on erroneous principles—actuarial, financial or other—so that the prestige of the business may be enhanced and that the chances of unintentional error or deliberate fraud may be reduced to a minimum. Also, the question of Federal supervision of insurance.

Fourth: The most effective co-ordination of life and other forms of insurance to public health activities, including all forms of social betterment aiming directly or indirectly towards an increase in longevity and a reduction in the death rate from preventable diseases.

Fifth: The problem of social insurance should be frankly discussed from the point of view of private enterprise, as related to the nation-wide interest in questions which are receiving an increasing amount of attention, best illustrated in the forthcoming International Congress on Social Insurance, to be held in this country in 1915. It is important that the institutions serving social insurance purposes in this country at the present time shall have the facts of their experience properly presented for public consideration, and that the enormous benefit resulting therefrom shall not be obscured by purely theoretical conditions of compulsory insurance methods abroad.

Sixth: The more effective and practical teaching of insurance as a science in universities, commercial high schools, etc., and the most suitable methods of including the elementary facts and prin-

ciples of insurance in all its branches in the study of business methods, commercial arithmetic, commercial law, etc.

Seventh: Finally, the Congress could consider the practicability of establishing a national institute for insurance science, in which all branches of insurance should be presented for the information and instruction of the public, as an aid towards a better understanding of the elementary facts of insurance experience and a guide in the framing of wise legislation for the supervision and control of a business which, in recent years, has assumed very large proportions. Such an institute, as implied in the foregoing suggestion, should also include an insurance museum for the collection and preservation of insurance literature, insurance experience, and the documentary methods and means by which the business has been carried on in the past, and is being carried on at the present time. This plan would tend measurably to advance the dignity of insurance as a social institution, and make manifest in the most convenient form the services rendered by sound insurance in all its branches to governmental, associated or individual efforts to make the world a better place to live in by eliminating the risks of the individual life. Such an institute would also serve as a means of welding together all of the numerous and at present widely separated insurance interests into one vast national and even international organization for the development and conservation of insurance as a science and an art making effectively and progressively for human betterment.

Along the line of the foregoing suggestions, the World's Congress on Insurance can, I believe, be made the most memorable event in the modern history of insurance; and the results of the vast gathering to be held can be made to promote the good of the business and the good of the people.

INSURANCE NEWS IN THE WEST

The Annual Meeting of the National Association of Insurance Agents.—The National Association of Insurance Agents continues to move forward. Last week's annual meeting at Minneapolis was eminently satisfactory to the members present. The attendance was not as large as at some meetings held in more central locations, but it was representative of a large area. Nearly all the Southern States had one or more delegates present.

With the possible exception of loss of business to large city brokers the question in which the members showed the deepest interest was that of underwriters' agencies. It came to the front in the president's address, in committee reports, in discussions and was the subject of the paper that probably attracted most attention. This paper was by C. H. Shamel, special counsel of the Illinois department, who took the place of Superintendent Rufus M. Potts, who was unable to be present. It was probably the strongest attack on underwriters' agencies on the grounds of common and statute law and public policy which has yet been presented. The association is going to print it for general distribution. It will censor it to some extent, so 'tis said, as the very bitterness of it detracted from its effectiveness, in the opinion of some who thought it a great paper. Hopeful ones among the members believe the Illinois department will win its fight on these institutions and thus open the way for similar victories for their cause elsewhere.

Progress was made towards getting an agents' qualifications law by securing the promise of Commissioner Preus, of Minnesota, to draft a bill for that purpose. Mr. Preus discussed this subject in one of the best speeches before the meeting. He approached it from the standpoint of the benefit to the public rather than to the agent and his position was the stronger for that reason. James F. Joseph, vice-president of the Sterling Fire, read a fine paper on "Jumbo Lines and Reinsurance Treaties." He charged to the agents the growth of this system and also the accompanying growth of underwriters' agencies and the spreading of small companies to smaller towns. Most of the agents agreed with him, but it is a question how far they will go in practice in trying to influence their companies in favor of net lines. W. S. Diggs, president of the Insurance Federation of Ohio, disseminated the federation idea in an address delivered by him. This is a comparatively new topic to agents of most States, but some have already shown an interest in it, foreseeing dangers to the insurance business generally unless the agents combine to protect their interests. The association will support the fight to get a court decision overruling the contention of the receivers of the Guardian Fire and of the American Union that agents must pay return commissions on unearned premiums of defunct companies.

* * *

Activity of Phoenix of London in the West.—One of the first outward evidences of the change which has come over the Western department of the Phoenix of London was the maintenance of "headquarters" by that good old company in the Hotel Radisson during the meeting of the National Association of Insurance Agents at Minneapolis last week. State Agent J. R. Hall, of Minnesota, was in charge. The room was on the same floor as the convention hall and so located that delegates had to pass it several times a day. Mr. Hall made everybody welcome and dispensed hospitality. The Phoenix was the only company that had headquarters in connection with the meeting.

* * *

Opposition to Constitutional Amendment in Wisconsin.—Considerable hard work is being done in Wisconsin in the effort to defeat the constitutional amendments which will be voted upon in November, under which the State could engage in the insurance business and issue real policies with the credit of the State behind them. It is not at all certain, however, that they will be defeated. In the past it has been customary for only a small percentage of the electors to vote upon constitutional amendments. The Socialists in the State number about 40,000, and their party has declared in favor of the insurance amendments. Of course, some besides Socialists will vote for them. The question is whether enough can be mustered against them to offset this vote. Insurance men are not alone in fighting these amendments. Some of the bankers are taking a hand also, as they see that theirs might easily be the next line the State would want to take over, once it gets well launched on its commercial career.

* * *

Missouri and Workmen's Compensation.—The Missouri workmen's compensation commission called a hearing at Kansas City for Thursday of this week to give those interested an opportunity to discuss the four bills which the commission has prepared. One is the workmen's compensation measure and another is a bill to provide for organization of mutual liability companies, a measure that frequently accompanies a workmen's compensation bill. Another provides for creation of an industrial commission to administer the workmen's compensation law and also to perform several other functions, now performed by various State officers, whose offices will be abolished if this bill becomes law. The remaining one in the series provides for the support of the industrial commission by taxing employers' liability and workmen's compensation premiums 5 per cent. This measure, which caused considerable criticism, was drawn because it was recognized that some of the other bills in the group could not pass without it. It was regarded

essential that the industrial commission have charge of factory inspection and certain other activities if a workmen's compensation law was to be administered in a way to produce most satisfaction. The commission which drafted the bills having decided that it was best to provide for insurance in companies and not in a State fund, it was believed that strong objections would be made to taxing the public generally for the supervision of the operation of insurance companies, as many taxpayers would regard the administration of the compensation law. Hence it was held advisable to tax this cost upon the companies, just as is done for the support of insurance departments and, in most Western States, for fire marshal departments.

* * *

Shortly after the Towner Rating Bureau promulgated the new contract rate of 1 per cent where the surety is directly liable to those who furnish labor or material to contractors, certain surety men in Cleveland began negotiations with the proper public officials and boards to get the form of bonds in use there changed. They were so drawn as to require the new rate. Last week county, city and board of education officials agreed to forms under which the surety is not directly liable to laborers and material men, thus making the old 50-cent rate obtain.

LA SALLE

Chicago, August 28, 1914.

ITEMS OF INSURANCE NEWS.

The United States League of Building Loan Associations was held recently in Washington, D. C. The reports show assets in thirty-one States $1,248,478,139, an increase of $110,878,491. Total number of associations 6,429, with membership of 2,836,433.

The Tennessee vital statistics for June has been issued and shows the total deaths were 2,921; total births, 4,344; death rate per 1,000 population, 15.5 per cent; birth rate, 23.1 per cent.

The total premium collections for fire insurance in San Francisco, during the first half of 1914 amounted to $1,989,509, a small gain over the first half of last year.

The annual report of the life insurance business in Hawaii has been received. Eleven American companies have 6,858 policies in force there for $19,449,500 of insurance, of which 1,271 policies for $2,855,347 of insurance were issued in 1913. The policies ceasing to be in force during the year were 522, representing $1,129,941 of insurance. Losses incurred during the year are reported as $193,133.42 and the losses paid as $224,390.16. The total premiums collected were $700,460 55. The total fire premiums written in the islands for 1913 were $567,821 and losses $87,630.

At the second annual meeting of the Mutual Life Underwriters, held last week at Macknac Island, Mich., the following officers were elected for the coming year: President, Nelson O. Tiffany; vice-president, Dr. G. W. Hopkins; secretary, Nelson O. Tiffany, Jr.; executive committee, F. J. Kuhlemeier, chairman; S. S. Hallam, J. C. Peasley; law committee, Hon. J. P. Hewitt, Edward M. Martin, John J. Seerley, Harry D. Williams, S. S. Hallam.

The suit to test the constitutionality of the Kentucky workmen's compensation law has been filed in the Circuit Court at Frankfort, Ky., by Robert Caldwell, acting counsel for the Workmen's Compensation Board. The defendant is the State Journal Company of Frankfort, which has refused to fill out blanks showing the number of men it employs, etc. The suit is a friendly one, as the defendant has no objections to complying with the act.

Commissioner Keating, of Montana, has ruled that while, under an opinion of the Attorney General, fire companies cannot under the Montana law write live stock insurance, live stock in buildings may be insured against fire as part of the contents of the building.

The California State Workmen's Compensation Fund has offered 5 per cent commission to postmasters of the third and fourth class as an inducement to procure workmen's compensation insurance for the Fund.

It is believed that a law will be introduced at the coming session of the California Legislature to provide health and sickness insurance for industrial workers.

An examination of injured employes during the past seven months shows that a large proportion of accidents under workmen's compensation have occurred to workmen who are physically imperfect. Some who are making a study of the question believe that the time is not far distant when workmen physically imperfect will receive a graded scale of wages according to physical condition. This will necessarily bring the law in conflict with the labor unions.

No shingles are to be permitted on the buildings which may be erected on the burned district of Salem, Mass. The new building code which was passed this week by the Salem rebuilding commission specifies that all roofs must be of slate, tile, terra cotta, metal or some other equally incombustible material.

The New York Workmen's Compensation Commission announced on Monday that it had instructed its counsel to appear in court for an employe who is a policyholder in the State fund. Its action grew out of the case of an employe who was injured in a small market where some meat products were manufactured. He claimed that the occupation was not included under the compensation act, although the commission ruled to the contrary, and instituted suit for damages at common law. The action taken by the commission shows that the State fund will protect its policyholders by furnishing counsel to defend suits of this character.

The stockholders of the Royal Life, of Chicago, last week voted to increase the company's capital from $100,000 to $200,000, and to add health and accident insurance to the life insurance which has heretofore been its only line.

R. R. Tuttle, formerly associated with the First National Fire of Washington, D. C., has commenced suit against that company for alleged violation of contract and for commissions, which he alleges are due him.

The plate glass insurance situation in New York is in a critical condition due to the disaffection of some companies from the local association. The Prudental Casualty, of Indianapolis, resigned on August 20 from the Plate Glass Underwriters' Association because of dissatisfaction with he present commission and immediately offered to write business at cuts of 10 to 50 per cent under the manual rates.

The European war may also inject another element of uncertainty into the situation. It will probably have some effect on the manufacture of plate glass inasmuch as one of the principal ingredients is mined almost entirely in Germany and with the importation cut off the plate glass manufacturers will be to a certain extent restricted in their operations. In such event there will be every probability of an increased cost of the commodity, which of course reflects itself in the plate glass insurance field in the additional cost of loss adjustment.

The fire insurance premiums collected in the City of New York during the first half of 1914 aggregated $12,560,591.01, as compared with $13,751,690.29 for the first six months of 1913, a decrease of $1,191,099.28. These figures are the combined returns of the individual companies reporting to the New York Board of Fire Underwriters on their business in Manhattan and the Bronx and to the Fire Insurance Salvage Corps on their Brooklyn business.

The Victor Talking Machine Company, of Camden, N. J., requires a strict and thorough physical examination of applicants for employment in the industrial departments and preference is given to men without families. About ninety per cent of the mechanical and laboring force are foreigners.

According to the "Policy-holder," of Manchester, England, the following are the figures for motor car and motorcycle accidents in the United Kingdom in 1912 and 1913:

	1912.	1913.
Motor omnibuses	199	226
Tramcars mechanically propelled	135	178
Other mechanically propelled vehicles	751	971
Totals	1,085	1,375

On Monday of this week, reorganization of the LaSalle Street Trust and Savings Bank, the payment of depositors in full and the resumption of business under new and acceptable management was announced by Colonel Milton J. Foreman as the purpose of the bank's stockholders. Colonel Foreman is head of the reorganization committee and has been working with W. C. Niblack, receiver, in adjusting the bank's affairs. William Lorimer, president, and C. B. Munday, vice-president, will be eliminated from the bank, officials acceptable to the Clearing House will be put in, and the bank's bad paper redeemed, according to the programme.

Comparative records of complaints, arrests and convictions in New York City, covering the periods from January 1, 1913, to June 30, 1913, and from January 1, 1914, to June 30, 1914, were published this week by Police Commissioner Woods. As regards residence, store and loft burglaries the following figures appear, the first figures given being for 1913 and the second for 1914:

Residence Burglaries—Complaints, 2,432 and 2,614; arrests, 518 and 632; convicted, 260 and 321; discharged, 128 and 144; pending, 180 and 167; Fines, $1,050 and $1,603.

Store and Loft Burglaries—Complaints, 2,420 and 2,532; arrests, 574 and 678; convicted, 291 and 339; discharged, 157 and 151; pending, 128 and 188; fines, $1,050 and $6,527.

Total property loss from burglaries, pick-pockets, highway robberies, etc., is figured as follows:

Property Lost—$1,821,208 and $1,362,417; property recovered, $765,212 and $882,159.

FINANCE AND COMMERCE

Financial and Commercial Review.
Banking Situation at Home and Abroad.
Statistics of Cotton and Coffee.
Market Prices of Securities and Commodities.

THE now famous "White Paper" of the British Foreign Office contains a letter by Sir Edward Grey to one of the English ambassadors written a week before the European conflagration broke out, in which he ventured the opinion that if several European powers became engaged in war it would involve the expenditure of so vast a sum of money and such an interference with trade that the war would be accompanied or followed by a complete collapse of European credit and industry. "In these days, in great industrial States," he adds, "this would mean a state of things worse than that in 1848." The scope of the European conflict has turned out to be greater probably than Sir Edward Grey at that time would have cared to predict. Certainly the effects upon international trade and commerce must be more pronounced and widespread than he had any idea of. The prophecy of the great English statesman of an utter collapse of European credit has come true and with it—something that had not been generally realized—has come a complete breakdown of the whole international financial system. As far as communication by means of the usual credit facilities is concerned, the principal countries of the world are now isolated. The world has to all intents and purposes gone back to the era before the international credit processes came into general use. The result is that the modern system of international business and finance is receiving such a test as it has never before experienced.

The outbreak of the European war occurred about a month ago. The beginning of hostilities was preceded by an avalanche of selling of securities of all kinds that closed all the stock markets of the world, including New York. It was followed by the declaration of moratoriums in all the principal European countries and many South American countries. The world went on a paper basis, practically speaking. Foreign trade was immediately dislocated. Now, after four weeks' time, it must be admitted that no material progress has been made toward a condition of affairs in any direction where business and finance may be resumed in a normal way. It is true that too much emphasis should not be laid upon this lack of progress. The task of doing business under the present conditions is enormous. The complexities of the situation are innumerable. The action of Great Britain in clearing the North Atlantic has led to the resumption of overseas trade in a halting and restricted way. This is a step in advance. But unfortunately it is not by this means alone that the raising of the blockade depends.

The real source of the paralysis of international trade and finance does not yet seem to be generally appreciated in this country. The heart of the whole matter is the fact that London, which has acted as the financial clearing house and discount market for practically the whole world, has ceased its functions. As a result paralysis has extended through all the multitudinous arteries of the world's commerce and finance. Perhaps the most striking example of the dependence of this country upon the London discount market is the situation as regards our cotton crop. For years the cotton crop has been financed by recourse to London. This year finds us making desperate emergency measures to take care of it ourselves. This experience is being duplicated by scores of other instances in this country and all over the globe. London is still the financial centre of the world and will remain so despite all the absurd talk to the contrary. The difficulties in which this country, geographically far removed from the scene of conflict, finds itself are eloquent testimony to that effect. The task of setting the machinery of the world's clearing house in motion again, even in a limited way, is one of immense difficulty, but on it must depend all real improvement in our own position. The various steps taken by the British Government and the Bank of England have been admirably conceived and carried out and have resulted in material relief. But it must be remembered that immense sums of money are necessarily locked up for an indefinite period. Our own indebtedness to England, which we find so much difficulty in settling is really insignificant as compared with the total liabilities of the rest of the world. It has been estimated that London is owed no less than $500,000,000 direct by Germany. This money is absolutely dead until the war is over. Similarly, the rest of the Continent of Europe is indebted to the London market to the extent of hundreds of millions of dollars, and in almost every country of the globe liabilities on an enormous scale are outstanding. Until this great mass of frozen credits can be brought into at least a partially liquid state it is obvious that there can be no material relaxation of the world-wide banking position.

In considering our indebtedness to Europe it is well to point out that the balance of trade was already swinging heavily against this country even before the war broke out. For the first seven months of the current calendar year the state of our foreign trade showed that the excess of exports over imports was only $59,000,000, as compared with $307,000,000 at the same time a year ago. This means an enormous additional handicap to be overcome besides those growing out of the war. This country has to depend upon a large excess of exports to offset the invisible trade balance which is always against us. This year our means of paying our debts without recourse to gold have been cut down. The great outpouring of securities from European investors since the first of the year inceased the aggregate of our indebtedness. The greater part of these were paid for, but in the last few days of trading on the Exchange here a huge quantity of foreign-owned securities was thrown over which probably has not yet been settled for. Maturing obligations of municipalities and corporations within the next few months alone constitute a great problem. New York City has maturities amounting to some $80,000,000 to be met before the end of the year. Payment for these has to be provided for in gold. Obviously there can be no question of repudiation of debts of this sort. The alternative to payment in gold is that we shall pay for them in wheat and other commodities. The problem of liquidating our immediate indebtedness to Europe without reducing our gold supply is receiving the first attention of our leading bankers in conjunction with the Government authorities. A free movement of our wheat and other grains to European ports obviously provides the best means of offsetting our foreign obligations. The methods proposed here for dealing with this question must be in the nature of things experimental and it may be too early to look for great improvement. Nevertheless, the results so far do not afford much ground for consolation. But here again attempts to overcome the blockade on overseas trade have been frustrated by the dislocation of the usual credit facilities in London. Europe is eagerly taking all the wheat she can get and the demand is apparently inexhaustible. Heavy shipments have been made, but most of these transactions have usually been covered by special arrangements made for payment by foreign governments of foreign firms. The ordinary exporter has been restricted from going ahead and making shipments by the fact that grain bills are no longer discounted in the London market as heretofore and

he has no assurances that he will be paid. That is the real difficulty in the resumption of a free export trade movement. Even with a good market abroad and with the trade routes open, the solution of this particular problem must wait on others. It is possible, however, that as time goes on the very urgency of the European demand for our foodstuffs will ensure the making of arrangements for a big trade movement. The food problem abroad is becoming daily a more important one. Broomhall's, the foreign trade authority, speaks with extraordinary pessimism on the outlook for the European crops. If the war is to be continued so as to interfere with the planting of next season's crops, a wholesale famine is predicted in European countries, and it is asserted frankly that this may produce a world demand for wheat which will make the present extraordinary high prices seem moderate, if not even low.

But how the immediate situation is to be met so far as this country is concerned it is a little difficult to foresee. New problems are arising daily and all that can be done is to deal with each as it arises in the most businesslike way possible. The New York City debt abroad is now the particular problem which is being struggled with. Conferences are being held daily to devise means of taking care of this matter. Many suggestions have been offered, amongst them the flotation of a short term serial loan by the City bearing a high rate of interest. But as the first maturities amounting to about $3,000,000 come due within a week or so time presses and it is considered not unlikely that these will be taken care of by a moderate shipment of gold to Canada. This will give a desired respite affording an opportunity for a return to more normal conditions in other directions which may make the finding of measures to take care of the remainder easier.

In the midst of the present crisis beset as it is with all sorts of dilemmas it is not inspiring to see the Administration busying itself with the formation of an American mercantile marine, but buying up foreign-owned ships of belligerent powers. This step is not criticised on the ground that an American mercantile marine is not an admirable thing in itself, but because neither the time nor the circumstances justify it. The Administration is taking the move either without the slightest understanding of the situation or with the deliberate endeavor of creating a solution of the present difficulties. As a matter of fact aside from the possibility of grave international complications an American mercantile marine will not help the present crisis in the slightest.

London	25⅞	25 9-16	24⅞	25	25	23 15-16

COTTON

August 29, 1914.

IT is needless to speak of the cotton futures markets, as all of them on both sides of the ocean remain closed. No one can foresee when they will re-open; inasmuch as it is the almost unanimous judgment of experienced persons in the cotton trade that some substantial price basis for buying and selling must be found, before it will be consistent with the welfare either of the members of the exchanges or of the producers and consumers of cotton, to have continuous price-making trading renewed. There is, of course, some buying and selling of cotton in the South, but at the most disparate prices. In Liverpool, the stock of cotton is being gradually worked off to spinners who are obliged to run at least half-time to take care of old contracts for goods. Liverpool to-day reported that spinners had taken during the week 31,000 bales, as compared with about half that amount last week. This is a distinct gain and shows that the English mills are beginning to get their affairs and their working forces reorganized. It is to be expected that from now on, unless Germany should gain a decisive victory over the Allies, the cotton industry in Great Britain will gradually improve and require more cotton with every succeeding week. It must be remembered that the great outlets for British cotton manufactures are untouched by the war, and that the temporary cessation of shipments to them has been done, not to lack of demand, but to the impossibility of procuring exchange and to the prohibitive cost of marine insurance. The cotton merchants of Liverpool have undertaken not to import any more cotton until the existing supply in that market has been disposed of; hence it is impossible to make any sales of actual cotton there from this side of the water, while of course the closing of the exchange makes the selling of future contracts impossible. In the United States, then, there are no buyers of cotton except American spinners, who from time to time and here and there through the South purchase such small quantities as will meet their immediate needs. The prices reported from various localities in the South show not the slightest uniformity, sales at 8½ cents and at 6 cents per pound being reported on the same day from places not widely apart. The only great market in the world in which the price of cotton is advancing, instead of declining, if faith may be put in reports that come in by devious sources. Yesterday it was reported that American middling cotton in Bremen is bringing over 8d., or 16 cents per pound. The explanation is obvious; but there is none the less something dramatic in this price of 16 cents in Bremen, compared with the 6 cents for which cotton was reported yesterday to be selling in parts of Texas. It is, of course, probable that the disparity will become much greater, for Germany cannot get a single bale of cotton, so long as England commands the seas; while the mere demands of the German army in the way of cotton goods must be forcing German spinners to a high consumption. These, however, are really matters of quite minor importance, at least from the point of view of the United States. Here we have the hard fact to face that during the four months when the bulk of our cotton crop is picked and ginned, there is almost certainly going to be an immense reduction in our exports, and that many millions of bales will be left on our hands which we have hitherto sold and got paid for. It has been roughly calculated that out of this crop as a whole we shall have to assume the burden of approximately 14,500,000 bales more than from any previous crop. If this should prove correct, we should find ourselves on August 31, 1915, with nearly three months' consumption on our hands, to which must be added the production of the season of 1915-1916. We do not ourselves believe in these figures, as we are confident that, even if the European War should endure for a full year or more, the world's demand for cotton goods, not only in all the great consuming countries but even within the war zone itself, will have compelled the spinning up of far more than 11,000,000 to 12,000,000 bales of American cotton. To our minds the perilous time for us lies in the early months ahead, in which new channels of commerce and finance between the great industrial nations (except Germany and Austria) and the outlying consuming countries have not yet been discovered and opened. The world's trade is now paralyzed by the breakdown of its customary machinery; but a thousand brilliant and experienced minds are, at this very moment, despite the war, engaged in readjusting that machinery to the new conditions. They will succeed in no long time, and the world's commerce will go on as before, save that Germany and Austria will be blanketed and isolated. The real problem, then, is to get past the next four to six months. And it must frankly be said that this problem cannot possibly be solved by the cotton trade alone. Its resources are what were needed in time of peace, and it cannot suddenly add to them sufficiently to meet the needs of war. There is no way in which the cotton trade can find an opportunity for the full exercise of its powers, unless powers greater than its own come temporarily to its assistance. Should the Secretary of the Treasury and the Federal Reserve Board be willing to take the step of giving some assurance as to the price at which banks may loan money on cotton, the entire problem would be solved, and we should have no sacrifice of our season's cotton crop. The cotton trade would see to that.

THE CONTRACT MARKETS

THE NEW YORK COTTON EXCHANGE.

The following were the high, low and closing bid prices for each delivery, on Friday, July 31, in cents and hundredths of a cent per pound, gross weight:

	July 31.	Mon.	Tues.	Wed.	Thurs.	Fri.
August—

Japanese Cotton Goods Exports.—According to recently published official figures, the cotton mills of Japan have sold to foreign customers this year a much greater quantity of yarns and fabrics than ever before. The export figures for the first four months of 1912 and 1914 are as follows:

Classification.	Quantity, 1912.	Value, 1912.
Yarn ....kin*	25,483,000	$6,476,000
Cloth	.....	3,639,000
Towels ....dozen	685,000	318,000
Underwear ....dozen	1,078,000	803,000
	1913.	1913.
Yarn ....kin*	47,831,000	$12,213,000
Cloth	.....	5,303,000
Towels ....dozen	1,081,000	449,000
Underwear ....dozen	1,249,000	969,000
	1914.	1914.
Yarn ....kin*	60,267,000	$15,920,000
Cloth	.....	6,150,000
Towels ....dozen	1,325,000	546,000
Underwear ....dozen	1,536,000	1,143,000

Totals—1912, $11,236,000; 1913, $18,924,000; 1914, $23,768,000.

*1 kin equals 1 1-3 pounds.

The Textile Industry in Russian Poland.—United States Consul Thomas E. Heenan, stationed at Warsaw, Russia, reviews the textile industry of Russian Poland as follows:

"The cotton goods industry during 1913 was in a very poor position through the rise in prices of raw materials, strong competition from the Moscow textile region and numerous insolvencies. The Warsaw textile market suffered especially. The situation, however, improved considerably toward the end of the year. Orders increased and in some instances mills began to operate with two shifts of workmen.

"According to official statistics Poland produces 31.7 per cent of the textile output of the Empire. There are 1,412 mills and factories with 168,629 workmen, of which 269 are spinning and cotton mills with 68,339 workmen, 856 yarn and woolen goods factories with 66,402 workmen, 31 ribbon and silk factories with 2,845 workmen, and 108 linen, hemp, and jute factories employing 15,918 workers. The city of Lodz alone contained last year over 600 textile mills and factories with 89,000 employes.

"Some Polish textile products begin to find a market abroad. Last year the Lodz region exported, chiefly to Persia and Mongolia,

first one ton of cotton goods as a trial shipment and later 11½ tons of woolen goods, 76 tons of bleached and blue cotton goods, 426 tons of dyed and printed cotton goods, and 14 tons of high grade woolen goods. Some textile were also exported to the Balkans, and larger orders for finished articles have been secured from Servia and Bulgaria. Most of the output of Polish textile mills, however, is exported into the Empire. During 1910, 1911 and 1912 the textile goods exported into Russia proper amounted to 67,100 tons, against 12,870 tons imported, chiefly from the Moscow textile region and 600 tons imported from various foreign countries, including Finland. But exports of Polish textiles to the Empire during the decade 1903 to 1912 increased by 8 per cent, while imports from the Empire increased by 29.4 per cent."

Cotton Production in Peru.—The production of cotton in Peru for the last five years, says the "West Coast Leader," is given in quintals (quintal equals 101.4 pounds), as follows: 1909, 380,-176.49; 1910, 330,291.06; 1911, 383,895.34; 1912, 375,651.32; 1913, 523,446.39.

This increase of more than 143,000 quintals for the five-year period 1909-1914 is largely accounted for by the low price of sugar and the bull cotton market. A great many sugar estates in Peru have been planting a fair quantity of cotton, and in addition large areas hitherto devoted to other products or merely waste land are being converted into cotton fields, because of the profits paid by this crop under present conditions. Not only is the quantity of cotton increasing, but its quality is improving as well, owing to the increased use of modern machinery in handling the product. The prices quoted on the Liverpool market determine the market price of Peruvian cotton, as there is practically no market in Lima.

Cotton Growing on Waste Land in Egypt.—At the International Congress of Tropical Agriculture recently held in London, a speaker told of the successful outcome of the experimental treatment of 800 acres of waste land in Egypt, which was so impregnated with salt that it had grown nothing for years. In 1912 it was drained and irrigated on a scientific system at a cost of $50 per acre and handed over to the fellaheen (peasants) for cultivation in five-acre plots. Last year the land was washed and a crop of rice grown, and this year (1914) a fair proportion of the area is growing a cotton crop that, it is hoped, will bring $75 to $100 an acre. As an indication of the value of this experiment it was mentioned that there are 1,500,000 acres of similar waste land awaiting development in the Nile delta.

NEW YORK QUOTATIONS FOR STANDARD COTTON GOODS AND YARNS

The following are quoted prices in the New York market for typical standard cotton goods (in cents per yard) and cotton yarns (in cents per pound) on Saturday of last week and on Wednesday of the present week:

Cloths.	Saturday.	Wednesday.
Print cloths, 28 in. 64 x 64s	3½	3½
Gray goods, 38 in., standard	4½	4½
Brown sheetings, Southern standard	7¾	7¾
Denims, 9-ounce	14-17	14-17
Tickings, 8-ounce	13	13
Standard prints	5¼	5¼
Standard staple ginghams	6¼	6¼
Yarns.		
Southern 2-ply skeins, 30s	24	22½

THE PROBLEM OF MARKETING THIS YEAR'S AMERICAN COTTON CROP FROM THE POINT OF VIEW OF A BANKER

By H. R. Eldridge
Vice-President, The National City Bank of New York*

THE problem of how to dispose of the cotton crop of the United States to the best advantage, during the crop season just opening, is a difficult one to solve. Its proper solution became a burning question immediately upon the sudden outbreak of hostilities in Europe. In the earlier period of the vast upheaval in the world's finance and commerce, however, particularly in the transportation of foodstuffs, occasioned by the European War, the matter of providing adequate means for marketing the cotton crop and for getting an adequate return for it, was perhaps prevented from receiving the thought which its importance deserves. But now, with the picking of the new crop well under way, with the cotton exchanges of the world closed, and with spinners unable or reluctant to buy the new cotton as rapidly as it is offered for sale, even at swiftly declining prices, it is apparent to everybody that some effective plan of handling the crop must be at once worked out, unless the cotton producers and the country as a whole are to see one of their most valuable annual assets virtually dissipated, leaving embarrassments in every direction.

The problem itself, as it presents itself, is reasonably plain; but a sound and beneficial solution of it is far more difficult and must be approached, not from the standpoint of desires and exaggerated notions of an ideal to be reached, but from that of common sense and with a frank abandonment at the start of unreasonable demands. We have reason to expect, in view of the present favorable outlook of production in the Cotton Belt, that a crop of from fourteen to fifteen million bales of cotton is before us; and we know that approximately two million bales of the past year's American crop remain in the visible supply of American cotton, not yet taken, much less consumed by the world's spinners. The belief of well-posted men in the cotton trade is that the world's consumption of the American crop this season, under prevailing conditions, will be a minimum of 11,000,000 bales and a maximum of 13,000,000 bales. Averaging these figures, an actual surplus of 4,500,000 bales is in prospect; and so long as no provision is made for eliminating it from the supply and demand situation, for the time being at least, that surplus will be a menace to the market and must prove a serious handicap to the hope that even a living price can be realized by the producer for his cotton. We known that Europe is already supplied with a stock of raw cotton to permit the available mills situated therein to operate at one-half capacity for at least twenty weeks; and that there is no real occasion for and little probability of their entering our markets as active purchasers for two or three months to come,—and especially will this be the case, if no provision is made in the United States to remove the weight of the probable surplus of cotton from the immediate supply and demand situation. American mills are already fairly well supplied and spinners are in a position to let the surplus production bear down with its full weight upon the scale of prices.

It therefore seems evident that, if the almost unprecedented situation in which American cotton is now found, by reason of causes beyond our control, is to be saved from great demoralization and heavy losses to the country and the cotton producers, some 30 per cent of this season's production must be removed from the present market and carried over to the next season; and that it must be accomplished in such a convincing way as to cause spinners to realize that the undoubtedly heavy surplus will no longer be a menace to the market, while the abnormal conditions in the cotton manufacturing industry of the world continue.

Under conditions prevailing in former years such a problem could not hope for solution, but the ability of our people to cope with such a situation is vastly improved at this time, as compared with the past; and, with a few sensible amendments to our existing financial laws, this new power can be made most effective. Were buyers of cotton once given sound reason to believe that the number of bales available to the mills from this year's crop is certainly limited to actual spinning needs, buying would undoubtedly be given an impetus and mills would prefer to stock up earlier than they would otherwise do, inasmuch as the good grades and the cleaner, more desirable cotton are always easier to obtain in the early months than when the season is more advanced. If this reasoning is sound, it behooves us to give our earnest consideration to the subject of how the elimination for the time being of the threatened large surplus can best be accomplished.

It will cost the cotton producer in wages and material not less than $15 per bale to pick, gin and pack the cotton he has produced this year. This sum represents a cash advance that cannot and must not be avoided. Meeting these charges makes imperative a liberal extension of credit on the part of Southern bankers to the growers of cotton. In addition to this, the immediate needs of the growers must be provided for. To meet these and at the same time to meet the costs of gathering the crop and preparing it for market, it is essential that facilities should be accorded, which will enable the producers to obtain about six cents per pound, basis middling, on their product. That such advances would be safe is hardly worthy of debate; and that paper secured by the pledge of cotton on that basis would be a desirable investment, cannot be gainsaid. Were the South to sell 70 per cent of its product at a fair and reasonable price, (and that is all it should expect, with the conditions what they are), and were it then to hold back until next season the remaining 30 per cent, obtaining advances thereon as just outlined, it would be in a position not only to discharge its current obligations, but also to provide funds with which to prepare for next year's farming operations.

It is obvious that until the cotton exchanges re-open and hedges are available no proper protection is offered nor no inducement given the cotton buyer or spinner to buy quantities of cotton beyond what is sufficient to cover actual sales or actual needs; and, until the exchanges are re-opened, buying must necessarily be indifferently active. It is therefore probable that the early part of the season, even if a method is devised for the removal from the market of the surplus, will prove burdensome and trying to the Southern banker and that he will be called upon to assume duties which in justice the balance of the country should share.

In the near future, the bankers of the wheat-producing sections will probably have surplus funds to invest, and the Eastern and Northeastern States, as well as those of the Middle West and the West, will be reasonably easy in the matter of money and will be attracted toward good paper, well secured and of assured payment when due. Under the old order of things, paper secured by cotton and many other commodities was rarely presented on the market in such form as to command the respect of investors; and it cannot be so presented this season, unless conditions are changed in certain respects. One essential to this end is a uniform warehouse receipt of undoubted integrity. As things now are, such warehouse receipts are few. Where it is deemed necessary to improve the standing of warehouse receipts, warehouses making application to

*A paper read before the Conference on marketing the cotton crop, held at Washington, August 24-25, on the Invitation of the Secretary of the Treasury, Mr. McAdoo.

the proper authorities should be governmentally licensed under regulations to be established, and each warehouse so licensed should be supplied with a Government inspector who should issue a uniform receipt for each bale of cotton, or other form of package representing a commodity stored, certifying thereon the mark, the weight and the grade. This system would create a form of security good beyond peradventure, and one that would command the respect of all bankers and investors everywhere. Each obligation issued should be accompanied with a certificate of insurance, issued by a reputable insurance company, indemnifying the holder against loss by fire of the collateral pledged. Ordinarily, such an obligation would take the form of a note, with a recital on its face of the collateral pledged; but it may be said at this point that there is a far better way to handle such paper than that employed heretofore in this country, and one of such common use in other countries that it seems inconceivable that we have not ourselves employed it before.

Under the terms of the Federal Reserve Act authority is given to member banks to accept drafts having not exceeding six months to run, arising from import and export commercial transactions, to an aggregate amount of not exceeding one-half the unimpaired capital and surplus of the accepting bank. The Act should be amended to permit of acceptances by member banks for a period not exceeding six months, of all drafts, or bills, drawn against import, export and domestic commercial transactions not exceeding in aggregate amount the unimpaired capital and surplus of each member bank, subject to the further limitations now provided for in the Act. Paper secured by the pledge of commodities held in storage, is commercial paper in every sense and would be eagerly sought by buyers knowing it to be safeguarded, not only by the responsibility of the maker and the value of the pledged commodities, but also by the credit of the acceptor. The acceptor, on its part, would be protected by the pledge of the commodities and by a guaranty that proper margins were to be maintained; and if its credit be high, the draft, or bill, could be drawn with provision for delivery of documents upon acceptance and the bill itself then sold upon the high credit standing of the acceptor. These bills could be made payable at the acceptor's office or at any centre or centres where the acceptor had correspondents, thus making them a most desirable form of investment.

Under this system, the acceptor would be assuming practically no risk, as his contract would provide against all market declines by automatically requiring more margin or by the sale of the collateral. Where it is probable that some sales may be made from among the commodities pledged, as would be the case with factors and buyers, such acceptances should be given only by banks whose standing is well known; for it would not in such instances be convenient to have the warehouse receipts accompany the acceptance, owing to substitutions of the collateral being at time necessary. And yet banks not so well known, desirous of placing such facilities at the disposal of their clients, could undoubtedly make arrangements for the service with their better known correspondents,—of course under properly authorized guarantees. In respect of cotton transactions the acceptance feature would very properly be extended by the banks to individuals interested in cotton, to cotton factors, cotton merchants and spinners, against cotton stored, under contracts made with acceptors, or against actual sales of cotton made, with or without marginal agreements; and in other branches of industry and commerce, the privilege would be extended to individuals, mercantile houses and corporations employing funds in all proper commercial transactions, whether secured or unsecured. Thus the discount markets of the country would be furnished with an ample supply of short-term paper, far superior and much better safeguarded than what we now term commercial paper, and so hedged about that it would be *prima facie* commercial paper within the meaning of the Federal Reserve Act. Such paper would prove a bulwark to our gold reserves, would be given the preference by commercial paper buying banks and, being always eligible for rediscount with the Federal Reserve Banks, would ever command the best prevailing rates.

Little fear need be entertained of the unwise use of acceptance power, if it is accorded to member banks. It would be made use of at times when local rates are out of line with the open discount market, thus giving to the business community generally an opportunity to avail itself frequently of lower interest rates. It would also come into play when certain sections of the country are experiencing very heavy demands for money or credit, as during the crop-moving season, thus affording a safe and effective method by which the surplus credit of one section may be utilized in another section temporarily deficient, to the mutual advantage of both. As the very existence of a bank depends upon its credit reputation, little fear need be had of over-indulgence of the acceptance privilege. The market itself would prove too discriminating, and offending banks would find their credit reputation impaired to such a degree as to limit their usefulness and jeopardize their very existence.

The Aldrich-Vreeland Act should be amended so as to permit of not less than 75 per cent of commercial paper being accepted as security from National Currency Associations for currency issued; not only is the margin required by the Act sufficient to make passed-upon commercial paper amply safe, but the joint responsibility of the associated banks makes it good beyond peradventure. Few banks in the South buy bonds as an investment; and the present provisions of the Act place upon Southern banks generally a hardship which should not be.

The recent amendment of the Aldrich-Vreeland Act provided that State banks giving notice of their intention to join the Federal Reserve System within fifteen days of its passage, would be eligible for membership in the National Currency Associations. The full value of this privilege was not, at the time, realized by the great majority of the State banks. Should it be deemed advisable, the Act might be further amended, so as to grant this privilege to the State banks, upon application for membership in the Federal Reserve System, if made within thirty days after the passage of such further amendment. Doubtless many of the State banks would now avail themselves of the opportunity.

The South is entitled to a reasonable profit over the cost of production of its cotton, but it must not demand a price which is unreasonable in view of the conditions all production has now to meet. It is idle to expect as good prices in this year of universal disturbance and distress as have at more propitious times prevailed. The South must co-operate with the balance of the country and not attempt to hold too large a proportion of its cotton, in the effort to realize for it the relatively high prices which have come to be regarded as normal, because they have prevailed so long. If the South makes this mistake, proper support will be lacking, and the hearty co-operation of the spinners and the banks cannot be expected.

On the other hand, the probable higher range of prices for foodstuffs this year will undoubtedly serve automatically to reduce the cotton acreage next season, and will thus prepare the way for the absorption of this year's surplus cotton, by reason of the shortage of next season's production. As cotton farmers are but human, Southern banker should bear in mind the absolute necessity of a small crop next year in order to equalize the over-production of this year; and they should insist upon their clients reducing their acreage by at least one-third.

Should the suggestions here made be deemed worthy of adoption, it would be found that the natural order of events would provide facilities for the retirement at maturity of a large part of the obligations issued. The remainder could be accommodated through renewals and sold on the open discount markets, or they could be re-discounted with the Federal Reserve banks, which will now in a short time be opened for business.

Unlike most commodities, cotton, if properly housed, suffers no deterioration whatever and therefore forms an admirable security. The cotton held should be stored where good warehouse facilities are obtainable. It should not be held on the farm, as it there is continually exposed to weather damage and is subject to high insurance rates. The small holder will find in cotton factors, local bankers and merchants excellent agencies through which to operate; and the larger holders can act for themselves by dealing direct with the warehousemen and their own bankers.

If the amendments to existing legislation here suggested are acted upon by Congress it would appear that the South itself, with reasonable help from the correspondents of its bankers and the general support of the public at large, had the solution of the problem in its own hands and can be trusted to handle the entire matter in a manner which will yield lasting credit to itself.

INDUSTRY, COMMERCE AND FINANCE

Reduction in the World's Mercantile Marine During 1913.—Lloyd's Register of Shipping has issued the statistical summary of vessels totally lost, broken up, condemned, etc., for last year. During 1913 the gross reduction in the effective mercanitle marine of the world amounted to 665 vessels, of 717,030 tons, excluding all vessels of less than 100 tons. Of this total, 371 vessels, of 533,002 tions, were steamers, and 294, of 184,028 tons, were sailing vessels. These figures, as regards steamers, are lower than those for 1912 by 39,743 tons; but as regards sailing vessels they are higher by 7,808 tons. The amount of tonnage dealt with by breaking up, dismantling, etc. (not in consequence of casualty), was 108,795 tons, or 48,846 tons less than in 1912. Nearly 20½ per cent of the steamers and 16 per cent of the sailing vessels removed from the merchant fleets of the world in the course of 1913 were accounted for in this manner. Of the total tonnage of such cases 42¾ per cent was represented by United Kingdom vessels.

* * *

Hemp Production in United States.—The United States produced approximately 8,270 tons of hemp in 1890 and only 5,100 tons in 1913, according to the United States Department of Agriculture's botanist who investigates fiber plants. These figures are not absolutely accurate, as statistics such as may be found for wheat, corn, and cotton are not available, but the general indication that the domestic production is decreasing is recognized by all connected with the industry. Notwithstanding this, scientists think that hemp may be cultivated in the Central United States, and that hemp and flax are the most promising and the most certain to yield satisfactory profits of all fiber-producing plants in this country.

From 10,000 to 15,000 tons of hemp are used in the United States every year. Hemp is used more extensively than any other soft fiber except jute. American spinning mills import, on an average, about 6,000 tons annually.

The climate and soils offer large areas in the valley of the Mississippi and its tributaries and in the Sacramento and San Joaquin Valleys in California are suited for hemp. Hemp improves the physical condition of the soil, destroys weeds, and when retted on the ground, as is the common practice, does not exhaust fertility. It is recommended for cultivation in regular crop rotations to take the place of a Spring-sown grain crop. (Retting is a process by which the gum surrounding the fiber is separated from it.)

Hemp cannot be economically grown in areas of less than fifty acres in any one locality, so as to warrant the use of machinery for harvesting and breaking. A general estimate of cost and returns on what may be considered to be the smallest practical area is given here:

ESTIMATED COST AND RETURNS FOR 50 ACRES OF HEMP.

Cost:	
Plowing (in fall) 50 acres, $2 per acre	$100
Disking (in spring), 50 cents per acre	25
Harrowing, 30 cents per acre	15
Seed, 40 bushels, delivered, $4.50 per bushel	180
Seeding, 40 cents per acre	20
Rolling, 30 cents per acre	15
Self-rake reaper for harvesting	75
Cutting with reaper, $1 per acre	50
Picking up from gavels and shocking, $1 per acre	50
Spreading for retting, $1.50 per acre	75
Picking up from retting swath and setting in shocks, $1.40 per acre	70
Breaking 50,000 pounds fiber, including use of machine brake 1½ cents per pound	750
Baling 125 bales (400 pounds each), including use of baling press, $1.40 per bale	175
Marketing and miscellaneous expenses	150
Total cost	1,750
Returns:	
Long fiber, 37,500 pounds, 6 cents per pound	2,250
Tow, 12,500 pounds, 4 cents per pound	500
Total returns	2,750

It is not expected that a net profit of $20 per acre, as indicated in the foregoing estimate, may be realized in all cases, but the figures given are regarded as conservative where all conditions are favorable.

* * *

The Foreign Trade of China in 1913.—In the China trade Hongkong still maintains the first place by a considerable margin, writes Vice-Consul General A. E. Carleton, Hongkong, the other four leading nations being Japan, Great Britain, the United States, and Russia, these five nations controlling 70 per cent of the total trade, which amounted to $710,631,715 in 1913. The proportion of the Hongkong import and export trade with China is 30 per cent, Japan 19 per cent, Great Britain 11.6 per cent, the United States 7.4 per cent, and Russia 6.8 per cent. China's imports in 1913 amounted to $416,218,666 and exports for the same period $294,413,049. Of all the countries Japan has made the greatest strides in its trade with China, as in indicated by these figures: In 1909, total $70,266,005, and in 1913 $134,970,319—an increase of $64,704,314 in five years. Germany has increased its trade during the same period by $18,776,557, Great Britain by $27,356,274, Hongkong by $54,742,186. The trade of the United States with China has not varied appreciably in the past ten years.

The annexed table shows the foreign trade of China of 1912 and 1913:

	1912		1913	
Countries.	Imports from.	Exports to.	Imports from.	Exports to.
U. S. and Hawaii	$26,786,177	$25,936,927	$25,861,855	$27,484,719
Hongkong	109,373,003	76,504,282	125,204,352	85,503,923
British India	34,518,023	5,603,800	35,253,239	4,518,924
Great Britain	55,393,585	11,765,720	70,744,989	11,932,881
Germany	15,636,161	10,610,730	20,660,755	12,428,413
France	2,169,956	28,718,762	3,868,647	29,747,341
Russia*	15,711,805	33,445,624	16,171,608	32,792,649
Japan and Formosa	67,352,322	40,893,883	87,123,063	47,847,256
Singapore	6,367,629	4,691,217	6,522,854	5,513,478
Belgium	6,476,106	4,850,682	11,556,512	4,778,870
Other countries	10,307,035	31,163,469	13,160,732	31,864,595
Totals	$350,091,803	$274,185,098	$416,218,666	$294,413,049

[There was some business transacted in the foreign exchange market this week, but quotations were uncertain and indefinite.]

Jute Production and Expectancy in India.—The Indian Government preliminary forecast of the Indian jute acreage, which has just been issued, estimates 3,278,276 acres under cultivation, which is an increase of 97,662 acres over the figures for the last year. The actual outturn of the last crop, including up-country consumption, was 9,988,500 bales, notwithstanding serious damage, especially in the Daisie districts. It is, therefore, believed that the present crop should supply an infinitely larger quantity because of the increased acreage and the fact that it has been grown under better conditions and has suffered little loss. Opinions differ here as to the probable outturn, but assuming a normal yield of 3⅓ bales per acre, which was the actual outturn of the 1912 crop, a crop of nearly 11,000,000 bales may be expected. This would give a large surplus over the world's consumption, which is a little over 10,000,000 bales annually.

At present jute stocks are very much depleted in Dundee, owing to the high prices which have prevailed during the season just drawing to a close. If present expectations as to the yield are fulfilled, the price of raw jute in all probability will decline and thus tend to revive the local industry which has been seriously depressed for some time past. Buyers of cloth and yarn have been withholding orders rather than pay the rates asked by spinners and manufacturers.

The following estimate of the jute consumption of the current year's crop is from a recent Dundee trade circular:

Countries.	Bales.	Countries.	Bales.
United Kingdom:		Continent:	
Scotland	1,250,000	Spain	150,000
England	25,000	Italy	250,000
Ireland	20,000		
Total	1,295,000	Total	2,610,000
		America, other countries	600,000
Continent:			
France	620,000	India:	
Belgium	150,000	Mills	5,000,000
Germany	800,000	Local	500,000
Austria	320,000		
Norway and Sweden	60,000	Total	5,500,000
Russia	230,000		
Netherlands	30,000	Grand total	10,005,000

* * *

Salt Production in the United States in 1913.—The marketed production of salt in the United States, including Hawaii and Porto Rico, in 1913 reached the record-breaking total of 34,399,298 barrels of 280 pounds each, or 4,815,902 short tons. The value of the product was $10,123,139. These figures are the greatest yet recorded by the United States Geological Survey for the salt industry in the United States, and they represent an increase of 3 per cent in quantity produced and of nearly 8 per cent in value compared with 1912. Michigan ranked first among the salt producing States in 1913 in both quantity and value of production, followed by New York, Ohio, and Kansas in the order named.

* * *

British and French Railway Operations in 1913.—Consular returns from England and France give, in summary form, the returns for the railway systems of Great Britain and France during 1913.

Government returns show that during 1913 the railways of the United Kingdom carried 1,228,316,000 passengers and 371,571,000 tons of freight. The passengers were divided into classes as follows: First, 26,025,000; second, 12,088,000; third, 933,498,000; and workmen, 256,705,000. The number of season-ticket holders is estimated to have been about 595,000.

The length of the lines, reduced to single track, was 55,438 miles. The gross receipts of the companies were $677,674,724, of which $277,044,978 was derived from passenger traffic, $324,191,630 from freight traffic, and $76,438,115 from other sources, mainly subsidiary businesses. The gross expenditure was $424,563,193, of which $383,494,799 was devoted to operating expenses, leaving a net income of $253,111,531.

The gross revenue and trading profit of the minor businesses are a matter of much interest and they are also shown:

Items.	Gross Revenue.	Trading Profit.
Passenger road vehicles	$608,313	$14,599
Steamboats	12,550,703	705,642
Canals	5,358,016	1,708,142
Docks, harbors and wharves	18,171,511	6,209,654
Hotels and refreshment rooms and cars	15,548,468	2,705,774
Other businesses	554,781	379,587
Totals	$52,791,792	$11,723,398

The following table, compiled from a report of the Ministry of Public Works, published in the "Journal Officiel" of June 21, 1914, shows the earnings of the railways of France, Algeria, and Tunis in the calendar year 1913:

Companies.	Total Mileage Dec. 31, 1913.	Receipts		Receipts Per Day Per
			Per Kilometer	Kilometer
State:	Miles.	Total.	(0.62 Mile).	(0.62 Mile).

THERE have been indications during the past week or two that efforts were being made to convince the Administration and the members of the Federal Reserve Board that it is inexpedient to put in operation the new Federal Reserve system, so long as the times remain troublous and uncertain to the extent they now are. It is argued by those who are in favor of postponement that, on the one hand, any and every rearrangement of things financial should be avoided while the banks of the country are in the position of having no landmarks to guide them, such as stock exchanges, cotton exchanges, etc., with their daily and hourly registration of market values, and, on the other hand, that the transfer of the necessary cash capital from the member banks to the regional banks may prove a difficult and even dangerous operation at a time when both domestic and foreign exchange is in a state of confusion and to some extent even complete deadlock, when the country's currency is to such an extent disarranged that it is necessary to have recourse to the Aldrich-Vreeland emergency currency on a large scale and to clearing-house certificates to some degree, and when bankers of every description have to be on the lookout every minute lest an insane craze to withdraw and hoard money should manifest itself among their depositors. It is argued that changes in the appearances of things (such as bank statements, etc.) are to be guarded against with especial care, inasmuch as misinterpretations of such changes are the fruitful causes of misapprehension and of irrational action on the part of the general public. Over and above these considerations, it is felt by many, even of the leading bankers of the country, that the opening of the facilities of the Federal Reserve banks at this moment might give unsuspected opportunities to foreign countries to get hold of large quantities of our gold, leaving us with only an essentially inflated currency to use. The present control over the export of gold, possible to maintain so long as all the banks in the country remain individual and private institutions, might become impossible to exercise effectively, if the banks of issue were virtually public institutions, whose credit, as representative of that of the Government itself, could only be sustained by unhesitating allowance to all and every of the full measure of their rights under the law. The impression is strong, even among those close to the facts, that there has already been an enormous drain upon the country's stock of gold; and it is said that nothing but the break-down of marine insurance, since the European War began, has saved us from the loss of immense quantities of gold during the past month. Every European country wants gold and is hungrily eyeing our store of it, ready to take advantage of the first opportunity to seize as much of it as possible. The Federal Reserve system in full operation, it is alleged, might give this opportunity, and we should then have to go through the same harassment and anxiety that almost cost us our National credit as a country of sound money, in President Cleveland's time.

That there is sufficient force in some of these arguments of the advocates of postponing the immediate opening of the Federal Reserve system for business to warrant the serious weighing of them, there is no denying. For instance, it is unfortunately true that ordinary human nature is so constituted that it is guided much by the appearances rather than the realities of things, and that it is peculiarly susceptible of alarm over a change of the appearances at times when it is for other reasons super-excited and over-solicitous about the future. It must be admitted, therefore, that the possibility exists that a considerable change in the form of the reports of banks, particularly in respect of the cash and quick assets held by them, would give rise to some misunderstandings among depositors and perhaps to withdrawals and hoarding here and there. Our own opinion is that the possibility is an exceedingly slight one and that it is one of no decisive character, from a business point of view. Again, some difficulties might be experienced, in the present marketless condition of the country, in transferring from the member banks to the Reserve Banks the cash capital upon which the latter will do business. The total amount of such capital to be transferred is by no means large, relatively speaking; yet some trouble might be found in withdrawing it from the current funds of the member banks. Here again, however, we believe that the difficulties loom much greater in anticipation than they would actually prove to be. The fact is, of course, that in this country at the present time, while credit is difficult to obtain and exceedingly dear, money proper is, from a banking point of view, in unusually abundant supply. The people of the United States have shown no signs as yet of hoarding money, in the way in which the people of European countries have been doing. In fact, Americans have less money in their pockets and in private hiding-places to-day than has customarily been the case. Hence the necessary transfers of cash to the Reserve Banks should make little apparent impression on the cash holdings of member banks.

We do not think, then, that the opponents of the im-

mediate inauguration of the Federal Reserve system are particularly strong in respect of the argument which may be called in colloquial phraseology, the "don't rock the boat" argument, nor in respect of the argument from the difficulty, under present conditions, of performing the chief preliminary act now required to bring the Reserve Banks into active operation. There is some force in these arguments, but not sufficient force, as we look at the matter, to make them controlling. When, however, we turn to their arguments with reference to our control over our stock of gold, the danger of our losing a large portion of this stock to foreign countries, if the Federal Reserve system is in operation, or the possibility that we may speedily find ourselves with nothing but an inflated currency, unsupported by gold, we cannot agree with them at all or admit any cogency in what they urge.

As regards our stock of gold, it seems a most curious thing that no small number of the very bankers in this country who have for years been ardently working to bring about a reform of our banking and currency system,—some of them even demanding a single central bank of issue,—appear to have penetrated so little into the fundamental principles of the reform they were advocating that they retain much of their old attitude towards our stock of gold, making almost a fetish of it. They still read the financial situation by the movement of gold from or to the United States, looking upon any export of it at all as a danger signal, calling for prompt action to check it before our entire banking position is impaired. Of course, the truth is that the stock of gold in the United States has for years been inordinate, and the only justification for our keeping it has been the irrationally individualistic system of banking we have been using. All thinking men, conversant with international banking and credit operations, have long been extremely impatient with us for keeping this great mass of gold out of common use, while we ourselves were continually seeking to obtain credit in every great money market in the world. The distinguished French political economist, M. Paul Leroy-Beaulieu, has for years employed a scornful phrase about our accumulation and retention of gold far in excess of our proportionate part of the world's supply; he says of this country that it is "*le plus grand accaparear de l'or dans le monde entier*, the greatest cornerer, or hoarder, of gold in the whole world." Now, one of the chief objects of banking and currency reform in the United States was to make it unnecessary for us longer to occupy this indefensible position. Through the new system we were to mobilize and concentrate our gold, so that we need keep on hand only such supply as is requisite for our banking necessities, and become able to relinquish the excess above our legitimate share of the general supply. As our financial fabric is becoming more and more knit in with the financial fabric of the other great commercial and financial countries, it is a matter of most obvious common sense that any excess of gold beyond what we can profitably use ourselves should go, naturally and promptly and without occasioning remark, to whatever market or markets abroad stand in need of it. At this present moment, the one market that must have gold, if the commerce and industry of the entire world are to get under way again, is London. Even though we consider our own benefit in the most completely selfish spirit, we should freely send to London every dollar of gold we have over and above our own imperative requirements. With that gold, London can liquidate world credits of a vast amount, and, better still, can begin to provide new credits for the world's commerce. We have a cotton crop to sell; and, if London could provide the necessary credits to English and Continental spinners, there would be an instant foreign demand for a large part of this cotton. As it is, we are planning to stack this cotton up in warehouses, to allow the producers of it to borrow against it instead of selling it, and to take all the risks of its value, instead of having these spread over the greater part of the world. And so it is with others of our commodities and with the output of our mills and factories, manufactured for our foreign customers. With our stock of gold immobilized and hoarded in our own banks, it serves us not a whit in procuring what we most need, outlets for the products of our industry and skill. With the aid of one-half the surplus of gold held by us beyond our true needs, credit would be fructified in all the great markets outside of the war zone itself; and we should be selling our cotton and the other fruits of our toil, instead of having to keep them in our warehouses, as dead to use as the needless gold in our banks. Only through the speediest possible putting of the Federal Reserve system into operation can we place ourselves in a position to render this service to ourselves, as well as the counterpart of it to the rest of the world.

Finally, most foolish of all seem to us the arguments about the necessity of keeping a firm hold upon our gold, even at the cost of delaying our new banking system, inasmuch as, if we let it go, its place will be taken by emergency currency or Federal Reserve notes, which mean nothing but unbridled inflation. We had thought that the notion that the issue of short-time currency, in a fixed proportion to a gold reserve behind it, against property constantly produced and constantly consumed, means inflation, was buried beyond recall with the passage of the Federal Reserve Act. All the scientific banking and currency systems of the world are based upon the principle that this is the one sure way of avoiding inflation. It appears, however, that there remain many minds among bankers so little acquainted with the scientific fundamentals of their business, that they cannot forget their old saws, but still hold to a conception of sound currency which has nothing to recommend it, except that we have had to live by it these many years and pay from time to time a ruinous price for the privilege.

To our mind, then, the sooner the Federal Reserve Board can complete the organization of the reserve banks in the new system, the better it will be for us, financially and commercially. We ought to be releasing gold, to go where it can do its best work for us,—i. e. to London. We ought to be getting rid of all expedients that have about them the appearance of irregularity or unusualness, such as the Aldrich Vreeland emergency currency and clearing-house certificates. We ought to be relieving all apprehensions everywhere in the country lest a weak spot be found, and lest the fear of other weak spots may lead to withdrawals of deposits and the hoarding of money. The more quickly we can get away from these things or the possibility of them, the better will be our case. The immediate inauguration of the Federal Reserve system is our one means of attaining these ends. It should not be postponed.

Arthur Richmond Marsh

THE STILL UNSOLVED PROBLEM OF FOREIGN EXCHANGE

THE troubles and losses inflicted by the European War upon virtually every department of the industry and commerce in the United States require no rehearsing. Everybody knows them, at least in part, from his own participation in them. The greater portion of our business energy to-day is directed, not to the production and distribution of goods or to the actual conduct of business, but to finding ways and means for keeping our trade from utter stagnation, our finances from confusion and our working population provided with some wage upon which to live. Many minds are at work upon the multiplicity of problems involved, and from many points of view. It is not, however, always, or perhaps even generally, understood by those thus active that there has been and still is a something that blocks their efforts at a certain point, preventing them from carrying out their plans, however beneficial these might be for their own particular businesses. This stumbling block is the paralysis of the foreign exchange market.

Many causes had combined to make the international financial situation of the United States at the beginning of the European War an embarrassing one. The vast re-sales to us of American securities held by European investors had increased our cash indebtedness to Europe, by the beginning of the present Summer, to an amount probably greater than ever had been known in our entire history. Then our foreign trade for many months had been running with a comparatively slight excess (in value) of exports over imports,—the Government figures for July 31, 1914, showing an excess of exports for the seven months ended on that date of only $59,000,000, as compared with $307,000,000 for the same period in 1913. Again, our railroad and other corporations had outstanding in Europe a very large aggregate of notes and other short-time obligations, for whose maturity and payment the investors holding them were only too eagerly waiting. New York City was known to have some $82,000,000 of revenue warrants in foreign hands and to be obliged to care for them as they should fall due. There were, of course, our semi-annual interest payments to be met; and the optimism of our Summer wanderers in Europe had not been chilled by anticipations of war, nor had they reduced their expenditures abroad, requiring for the most part remittances either of gold or of commodities to meet them. Early in the Spring Europe had begun calling heavily upon us for gold, and we had remitted great sums before the end of July. But these remittances had made little impression upon the great mass of cash debits to our account, which our foreign creditors were in a position to call for, if they would.

Then came the war. Suddenly the usual exports of our commodities to Europe, except to some extent, foodstuffs to the nations with open ports, virtually ceased. The most important of all these commodities from the point of view of the liquidation of our foreign indebtedness,—cotton,—ceased to be exportable at all, even the accessible foreign markets, like Liverpool, deciding not to import a bale of cotton until their existing stocks had been disposed of on a basis to save their merchants from heavy losses, or perhaps ruin. Even in respect of the commodities for which some European demand continued, the exorbitant cost of marine insurance and of such ocean freight room as could be secured, made a dreadful hole in the foreign credits derived by us from the sale of the commodities; for we must pay to foreigners, out of the market value of what we have to sell, the cost both of marine insurance and of ocean freight, inasmuch as we have almost no marine insurance companies or mercantile marine of our own. In short, the international position of the United States suddenly became that of a debtor accustomed to meet his obligations gradually with the products of his own industry, but suddenly forced into the position of a debtor for cash, and to an amount he himself had not realized as possible and for the gathering together of which he had made hardly the preliminary preparations.

The situation then is that the United States is heavily indebted to Europe, and particularly to London. Moreover, virtually all the customary methods of liquidating the indebtedness are closed to us, except the shipment of the actual gold; and this, too, has been until now made exceedingly difficult and ruinously expensive by the scarcity and high cost of marine insurance. But something must be done about the matter, unless a palsy is to extend over not only our international commercial and financial relations but also our domestic industry and commerce. Our creditors are in most pressing need of their money, and they are not in a position to take it, as previously, "in kind," i. e. in the shape of the commodities we have for export. In fact, a condition precedent to their taking our commodities is that they should take our money, in order to liquidate their own strained position.

Naturally, our bankers and other persons of standing in the commercial and industrial community, as well as high officers of the Government, have been conferring together constantly about the vast and complex problem. The Government has itself taken the first step, by relieving the lack and high cost of marine insurance, through its War Risk Bureau just about to begin operations. Gold, if not commodities, will speedily be able to be shipped abroad upon a fairly reasonable basis. In spite of this, however, the grand problem of restoring the free flow of foreign exchange is not yet solved. The truth seems to be that sharp divergencies of opinion have arisen between the bankers engaged with the question as to the desirability of immediate repayment of our foreign indebtedness. Some of the chief of the bankers,—as, for instance, Mr. Schiff,—stoutly maintain that we owe the money and ought to pay it forthwith. Others lean to the opinion that we should in effect apply to our own foreign indebtedness the same principle of the moratorium which the countries to which our indebtedness is due have established for the benefit of their own citizens. An argument much used in support of this latter contention is that our own financial safety depends upon our keeping hold of the gold we have, lest we be left with only an inflated monetary medium, perhaps in the shape of Aldrich-Vreeland Emergency Currency, for the domestic circulation of the country. Perhaps it may be said that up to the present moment a predominating majority of our bankers, even in New York City, have been chiefly moved to the argument just outlined. They want to retain our stock of gold, for fear of a worse thing; and they do not shrink from the similitude of a moratorium for the foreign debts of the United States, inasmuch as virtually all the nations of Europe have declared moratoria for the debts their citizens owe, though cannily not for those debts that are due these citizens from the citizens of other nations. So far does this feeling go, that many of our bankers are decidedly irritated over the action of the Bank of England in establishing a depositary at Ottawa, Can., whither gold can be shipped from this country with no war risk whatever, and at a rate of exchange equivalent to $4.90 for sterling cables, while the approximate cost of sterling exchange on London is at this writing from $5.07 to $5.10, after having risen to the unbelievable height of more than $7.00 for small amounts at the severest period of the trouble. There is little evidence, then, that the Canadian undertaking of the Bank of England is finding favor in the United States or that it has as yet been resorted to in any large way by our bankers.

Some expedients have been tried and many have been pro-

posed for the remedying of the situation. The plan first put into use by the National City Bank of New York, and since adopted by some other large New York banks, of bringing together persons having bills to buy and bills to sell on countries not involved in the war as those in South America, whose exchange operations have hitherto been liquidated through London; and, by acquiring the small surpluses of London credits arising on the one or the other side in the process of off-setting, slowly gathering a fund of credits in London itself, for use in direct Anglo-American transactions has been highly useful and has eased many a difficult commercial situation. It was by some such painful process as that, that there was secured last week the $12,000,000 of exchange on London, required by the City of New York for the payment of the first instalment of her $82,000,000 of outstanding revenue warrants, payable in London. The novelty of the procedure, however, and the slowness with which the courses of world finance and credit are changed, make of this plan rather a palliative than a true remedy for the present difficulty. It is an acorn which will by-and-by grow into a mighty oak; but at this moment it is barely showing its first leaf.

After all is said, the problem of the present cannot be dodged, and that is whether we shall pay our debts abroad on the nail, in spite of the fact that we are suddenly cut off from our traditional method of cleaning them up by shipments of cotton, grain and others of our commodities and products; or whether we shall maintain an undeclared but none the less real moratorium on our obligations to English and other foreign creditors of ours. Perhaps the disinclination shown in some quarters in New York squarely to adopt the former of these alternatives is in part due to a feeling that the entire burden of finding the necessary gold will, as usual, be thrown upon the New York bankers. In this connection, it has been suggested that means be adopted to compel banks in other Reserve Cities to contribute their share of the gold required, on the theory that the whole country has been making use of the facilities for trading with foreign countries afforded by New York, and accordingly should now come forward, through its Reserve City banks, with the gold needed for the settlement of balances of accounts arising from that trading. Again, there have been under consideration expedients for wringing the gold out of the general circulation, where it is not needed. Naturally, too, the discussion has turned again and again to the provision of facilities, whether through the Government or otherwise, to set in motion again the stream of our credit-making exports. What the Government has done and is doing in furtherance of this suggestion is well known.

The trouble with this last expedient, however, in the present posture of affairs abroad, and particularly in England, is that it is in a sense putting the cart before the horse. Our commodities are needed abroad, and one of them, foodstuffs, must be had at any cost and at the expense of all other branches of commerce. But the export of our cotton involves the making of new credits, for the time being at least; and this is the very thing which England cannot do, without having more gold wherewith to do it. London, as the centre of the world's clearing of credits, is already overloaded with credits that cannot be cleared. Moratoria all over Europe are producing their natural result in the world's clearing house, London. It is estimated that the liabilities to England of Germany alone reach $500,000,000, not a penny of which will London be able to get until the end of the war. In less degree other European countries, even some of England's allies, stand in the same position to London. To perform the credit functions necessary to set commerce in motion again, London must be able to grant more credits, and still carry the mass of credits that cannot be liquidated. Only gold will enable this to be done; and if the United States, herself a debtor to England, declines to supply the gold, insisting on an immemorial right to liquidate by means of commodities like cotton, the result can only be that we can export our cotton to Liverpool only for hand to mouth consumption. We cannot hope that Liverpool will be able to carry a great stock of it, thus relieving us of so much of our heavy burden of financing the season's cotton production.

If this reasoning be sound, the first thing the United States ought to do, even at some sacrifice and risk, is to pay into the London market enough gold against our indebtedness there, to enable the credit machinery, upon which we ourselves must rely for the sale of our surplus commodities abroad, to be set in motion again. It is a matter of detail how the gold is to be gathered together to do this. The means are many, and all are well known to our bankers. A further benefit which would result would be the speedy doing away with the fears now common that we are in for a period of dangerous inflation, owing to the issue of emergency currency issued against accumulating stocks of cotton and other products for which there is no present market and which we are simply holding in warehouses. This fear is what makes many desire to hold on to our gold; but if, by the wise use of our gold in paying our indebtedness to London, we can avoid holding our cotton and the issue of emergency currency against it, there can be no possibility of the dreaded inflation. On this point, and in conclusion, there may be quoted to advantage a passage from a recent article in the London "Statist." It is as follows:

"Is there any probability, if measures are taken to restore confidence and enable the United States to pay its debts in Europe during the next few months, and, on the other hand, to export food-stuffs, cotton, tobacco, and so on, that the Government will need to issue anything like 20 or 29 millions sterling of paper; and that the banks, in addition, will take emergency notes amounting to another 20 millions? Surely the present difficulties in the United States are due to the shock to credit given by the sudden and unexpected outbreak of war upon the European Continent, and to the fear that, in consequence, Europe would not be in a position to continue dealing as of old. If, however, our fleets are able to keep the seas clear, and if measures are adopted for facilitating the acceptance and payment of bills, is it in the least probable that there will be such a demand for currency as will require the issue of new notes to the extent of 40 or 50 millions sterling? On the contrary, is it not probable that the need for inflation will then have passed? Trade in the United States has been restricted for a considerable time. There is little fresh enterprise. There is still less desire to engage in speculative ventures. Therefore, it would seem that a very large issue of notes will not be required if measures are taken to restore confidence. In that case, the United States happily has such abundant crops that she will be able to do an immense trade with Europe, and more particularly with the United Kingdom. Once exporting on a great scale begins confidence will rapidly revive; the demand for large paper issues will cease; and there will not be that extreme cheapness of money which would probably follow very large issues of paper. Here at home the advantages would be great. Our own Government has done so much to restore confidence that the outlook is now far more promising than anybody could have expected even a few days ago. All that is needed is that all difficulties in regard to remittances should be removed. The necessity for that is so great that it is unwise to stickle about theoretical objections. The present crisis, we venture to hope, will not last long. It certainly will not if our fleet can keep the seas clear. Whatever is necessary and promises to be effectual, therefore, should be done without regard to straight-laced prudishness respecting more or less imaginary principles."

CONCRETE RESULTS AS YET ATTAINED THROUGH THE WASHINGTON COTTON CONFERENCE

AT the close of the conference called at Washington by Secretary of the Treasury McAdoo, on August 24 and 25, to consider means for obtaining a reasonable price for this season's cotton crop, despite the large falling off in exports anticipated by reason of the European War, Mr. McAdoo appointed a committee to report to him upon the matters discussed at the conference. This committee was as follows:

Producers.—C. S. Barrett, Union City, Ga.; F. M. Coker, Hartsville, S. C.; J. O. Thompson, Birmingham, Ala.

Manufacturers.—G. Gunby Jordan, Columbus, Ga.; E. Farnham Greene, Boston, Mass.; Lewis W. Parker, Greenville, S. C.

Bankers.—A. H. Wiggin, New York City; Royal A. Ferris, Dallas, Texas; Festus J. Wade, St. Louis, Mo.;

Warehouse and Transportation.—S. T. Morgan, Richmond, Va.; Harry Walters, New York City; B. L. Mallory, Memphis, Tenn.

Tobacco.—D. Y. Cooper, Henderson, N. C.; William Elliott, Henderson, Ky.; F. G. Ewing, Cedar Hill, Tenn.

Commercial Interests.—W. D. Thompson, New Orleans, La.; Richard H. Edmonds, Baltimore, Md.; R. Goodwyn Rhett, Charleston, S. C.; Theodore H. Price, New York, secretary.

It is to be observed that this committee contained not a single cotton merchant, in the larger sense of the word, the only actual dealer in cotton upon it being a cotton factor of New Orleans, doing only a local business in that market. In short, as was pointed out in this paper last week, the efforts of the cotton trade and the machinery which the trade has evolved during the past forty and more years, not only for distributing the cotton crop to the immediate users of it, but also to those willing to contract for it for years ahead, were plainly not desired in the premises.

After several meetings, the committee submitted a report, not quite unanimous, to the Secretary of the Treasury, which was immediately made public by him, apparently with his approval. The report was as follows:

August 28, 1914.

The Secretary of the Treasury,
Washington, D. C.

Sir:—The Committee appointed by you pursuant to resolutions of the so-called Cotton Conference held in Washington, August 24 and 25, beg to report that at a session held in Washington, August 28, the following report was adopted by the undersigned, being a majority:

(1) That the Committee entirely approve of and congratulate you upon the announcement made by you yesterday afternoon that notes secured by warehouse receipts for cotton and tobacco, and naval stores, and having not more than 4 months to run, will be accepted as a basis for the issue of currency to the members of the national currency associations at 75 per cent of the face value of said notes.

(2) That it is the sense of the Committee that cotton, tobacco and naval stores should be marketed as deliberately as possible until they can again be exported in normal quantity and that when properly conditioned should be warehoused with responsible concerns, that they should be protected against weather damage and be properly insured against loss or damage by fire.

(3) That warehouse receipts for these commodities are proper collateral for loans by banks, and should be so accepted, with such limitations as to margin, inspection and valuation as conservative bankers may each in their discretion see fit to impose.

(4) That the average market value of middling cotton for the past six years has been in excess of 12 cent per pound, that the Comittee is informed that the cost of producing cotton averages throughout the United States about 9½ cents a pound, that it is a rule of economics that the production of staple commodities will decrease if they continue unsalable at less than the cost of production plus a reasonable profit. That cotton does not deteriorate when properly warehoused, and is as good twenty years after it is picked as when it is first gathered; that it can therefore be carried over until the restoration of normal business conditions enables the world's consumption to absorb it. The Committee is therefore of the opinion that every effort should be made to assist the producers to hold their cotton for a price that will minimize their loss as far as possible until such time as the channels of foreign trade shall be reopened. That loans upon cotton made upon a basis of 8 cents per pound for middling, less such margin as the lender shall consider necessary, will afford reasonable protection to bankers and will greatly facilitate the financing of our most important export crop in the present emergency.

(5) That in suggesting 8 cents per pound for middling cotton as a basis for loans, it is not the purpose of the Committee to convey the idea that that figure represents in their opinion the intrinsic value of cotton, but that it is sufficient in their judgment to meet the requirements of the situation, and enable the farmer to market his cotton in an orderly and deliberate manner.

(6) That in the tobacco and naval stores the Committee is informed that when these commodities are properly conditioned, stored and insured, they are practically non-perishable, and that the Committee therefore recommends that warehouse receipts for tobacco and naval stores be accepted as security for loans on a basis that has due reference to their market value less such allowance as the lenders shall consider reasonable in view of the present suspension of the export demand.

(7) Your Committee recommends that notes having not longer than four months to run, when secured by proper warehouse receipts for the aforesaid commodities, properly insured, be accepted for rediscount by the Federal Reserve Banks, when organized, and that they also be approved by the national currency associations as security for additional circulation to the national banks under the provisions of the Aldrich-Vreeland Act, as amended by the Federal Reserve Act.

(8) That a sub-committee be appointed by you for the purpose of conferring with the Treasury Department and the banking interests with a view of carrying into effect the recommendations herein made. Signed,

Royal A. Ferris	W. B. Thompson
S. T. Morgan	J. O. Thompson
Lewis W. Parker	Wm. Elliott
R. G. Rhett	F. G. Ewing
D. Y. Cooper	B. L. Mallory
H. Walters	G. Gunby Jordan
Richard H. Edmonds	Theodore H. Price

Respectfully submitted,
Theodore H. Price, Secretary.

It will be observed that the above report deals only with the holding (in storage or otherwise) of cotton,—besides tobacco and naval stores,—and financing it while it is so held from the market. It does not even touch upon the really vital question of distributing the cotton both this season and over succeeding seasons. The crux of the whole matter lies here, for nothing is more certain than that the mere storing and withholding from the market of 4,000,000 to 5,000,000 bales of cotton, however, it is financed, will mean a low price for cotton for at least two and probably three or

four years. Every user of cotton all over the world will regard the existence of such a mass of cotton, which is meant to be sold in case of an advance in the price as a sufficient reason for buying only from hand to mouth, and for making no contracts for cotton for future years. The extensive sales for far distant deliveries which the cotton trade could certainly make, if it were free to act, and which would support the market for the present supply, will simply not be made. In any case, they can only be made through the machinery of the great cotton exchanges, which are now about to be hampered in every way by the recent legislation by Congress, known as the Lever Act.

THE PRODUCTION, CONSUMPTION AND PRICE OF THE MINOR METALS IN THE LAST TEN YEARS

By Édouard Payen

Translated from "L'Économiste Français"

ACCORDING to a tradition already time honored, this paper will give a retrospective survey of the production, the consumption and the prices of copper, lead, zinc, tin, aluminum and nickel, during the year 1913 and the nine preceding years, and, when necessary, going even farther into the past. At the moment, in the world-wide unsettlement caused by the European crisis which has just been precipitated, such a study is of little immediate use, but it has a documentary value the interest of which will be evident on the day when the world's economic life resumes its natural course.

This article will be confined to the study of copper and lead.

Copper.

The production of copper, which, in 1912, for the first time exceeded one million tons, has continued to exceed that figure during the past year, although with a slight falling off from the figure of the year previous. The decline was 12,700 tons, or 1.24 per cent; but this is of slight importance if it is considered that, in 1912, the progress as compared to 1911 was considerable, being 124,800 tons or 13.9 per cent.

In the total production of raw copper which reached, in 1913, 1,005,900 tons, the part played by Europe was 186,500 tons against 195,300 tons in 1912, 181,900 tons in 1910, and 129,700 tons in 1904. Of the European producing countries, England is the most important, although its production for 1913 was the smallest of the decade under consideration, being only 52,100 tons against 63,100 tons in 1912 and 65,000 in 1904. The largest figure for its production was that of 1906 (72,700 tons). Germany, which ranks second, is, on the contrary, making progress, with 41,100 tons in 1913, the maximum figure for the decade, against 38,900 tons in 1912 and 30,300 tons in 1904.

Russia, which comes third in rank, has made great strides during the last ten years; its production has increased from 10,900 tons in 1904 to 16,800 tons in 1908, 18,500 tons in 1909, 22,600 tons in 1910, 25,600 tons in 1911, 33,500 tons in 1912, and 34 300 tons in 1913. Spain has witnessed an increase in production from 8,100 tons in 1904 to 14,600 tons in 1908, 18,300 tons in 1910, and 23,300 and 23,600 tons in 1912 and 1913, respectively. France, which had almost doubled its production between 1904 and 1911 (6,900 tons and 13,200 tons), recorded in 1912 and 1913 only about 11,900 tons and 12,000 tons. Servia now appears in the statistics with 6,400 tons in 1913 against 7,400 in 1912.

America claimed, out of the total production of raw copper, 692,900 tons in 1913 against 708,400 in 1912, the maximum figure of the decade, and 463,400 tons in 1904. Of this total, the United States accounted for 589,100 tons against 592,900 in 1912 and 380,900 tons in 1904; they are in quality and quantity the leading producers of copper in the world.* The English possessions in North America have a production which exceeded 8,000 tons in 1904, 15,500 tons (the maximum figure) in 1912 and 13,800 tons in 1913. The production of the rest of the American continent is far from negligible since it amounts to almost half that of Europe and has even at times exceeded this total. The figures are 74,500 tons for 1904, 86,500 tons for 1911, about 100,000 tons for 1912 and about 90,000 tons for 1913.

The Asiatic production jumped from 32,100 tons in 1904 to 55,000 tons in 1911, 67,000 tons in 1912 and 77,200 tons in 1913, Japan being the most important of the Asiatic producers. Australia furnished 41,800 tons in 1913, against 44,900 tons in 1912 and 22,700 tons in 1904. Finally, Africa, where production was reckoned about 1,000 tons in 1910, increased its output from 3,000 to 7,500 during the last two years.

The world's consumption of raw copper in 1913 was, contrary to what appears as regards its production, greater than that of 1912, reaching 1,044,500 tons, against 1,038,700 tons in 1912 and 662,500 tons in 1904. From this it may at once be remarked how much the consumption of this metal has increased during the last ten years. Of this total increase of 382,000 tons, Europe is responsible for 240,200 tons and America for 130,300 tons, the latter amount being almost entirely consumed in the United States. There remains scarcely 12,000 tons for the three other continents,—Asia, Australia and Africa.

In Europe, the largest consumer of raw copper is Germany, whose consumption reached 136,300 tons in 1904 and 259,300 tons in 1913, against 231,700 in 1912. In this increase in the consumption of copper in Germany may be seen a proof of the industrial activity of that country and particularly of the electrical machine industry. France is, with Germany, the only one of the large European countries, where consumption has increased, it having expanded from 56,600 tons in 1904 to 103,600 in 1913, against 98,500 in 1912, 95,700 in 1911, etc. Great Britain, which takes second rank, placed between the United States and France, shows no progress. After having touched the figure of 159,100 tons in 1911, 127,900 tons being its share in 1904, the consumption fell to 144,700 tons in 1912 and 140,300 in 1913. The Russian consumption declined from 31,200 tons in 1904 to 27,600 in 1905 and 23,500 and 17,600, respectively, in 1906 and 1907, since when it has continually risen up to 40,000 tons, remaining almost stationary in 1913 (40,200 tons). The consumption of Austria-Hungary increased from 23,200 tons in 1904 to 48 200 in 1912, and 39,200 tons in 1913; the Italian consumption, from 14,900 tons in 1904 to 34,200 in 1912 and 31,200 in 1913; the Belgian consumption from 7,800 tons in 1904 to 15,000 tons in 1912 and 1913. The United States, not content with being the largest producers of copper in the world, are also the largest consumers. From 218,400 tons in 1904, their consumption increased to 371,800 tons in 1911 and 348,100 tons in 1913, the latter year being less favorable than the preceding one which was marked by an increase of 50,000 tons over 1911. The consumption in Asia, Australia and Africa increased from 38,800 tons in 1904 to 40,400 in 1912 and 50,300 in 1913.

Below will be found the round figures for the world's production and consumption of raw copper from 1904 to 1913:

PRODUCTION, CONSUMPTION AND AVERAGE ANNUAL PRICE OF COPPER FROM 1904 TO 1913.

	1904.	1905.	1906.	1907.	1908.
Production of raw copper (tons of 2,200 lbs.)	647,900	693,900	720,600	712,000	763,800
Consumption (metric tons)	662,500	727,400	722,600	663,600	712,500
Average annual price at London (pounds sterling)	59.0.6	69.12.0	87.8.6	87.1.8	60.0.6

* On this subject, see the article of M. Pierre Leroy-Beaulieu, "L'Économiste Français," January 31, 1914.

	1904.	1905.	1906.	1907.	1908.
Value of the production in millions of marks (23¾ cts.)	769,000	971,200	1,266,900	1,246,900	921,900
	1909.	1910.	1911.	1912.	1913.
Production of raw copper (tons of 2,200 lbs.)	852,400	891,000	893,800	1,018,600	1,005,900
Consumption (metric tons)	790,700	916,800	954,100	1,038,700	1,044,500
Average annual price at London (pounds sterling)	58.17.3	57.3.2	56.1.9	73.1.2	68.5.9
Value of the production in millions of marks (22¾ cts.)	1,008,900	1,024,100	1,008,100	1,496,400	1,381,200

*The figures of this table, as all those cited in the course of this article, are taken from the statistics of the "Metallgesellschaft."—Frankfurt am Main, July, 1914.

This table gives also the average annual price of copper per ton in pounds sterling [pound sterling = $4.86]. This is an element of the greatest importance, which is worthy of considerable attention. It is well known how essential the course of copper prices is not only to various industries, but also to the numerous copper producing companies. To complete the information above, there is given in the following table the annual average price of copper per ton of 1,016 kilograms [2235.2 pounds], at London, from 1883 to 1904, in pounds sterling:

AVERAGE ANNUAL PRICE OF COPPER IN LONDON FROM 1883 TO 1904.

Year.	Price Per Ton of 1,016 Kilo. £	s.	d.	Year	Price Per Ton of 1,016 Kilo. £	s.	d.
1883	62	17	11	1894	40	7	4
1884	53	17	6	1895	42	19	7
1885	43	11		1896	46	18	1
1886	40	1	8	1897	49	2	7
1887	46	0	5	1898	51	16	7
1888	81	11	3	1899	73	13	9
1889	49	14	8	1900	73	12	6
1890	54	5	3	1901	66	19	8
1891	51	9	4	1902	52	11	5
1892	45	13	2	1903	58	3	2
1893	43	15	6				

To sum up, during the last thirty-one years, the average annual price per ton of copper has only eleven times been above sixty pounds sterling, ten times below fifty pounds sterling and ten times between fifty and sixty pounds sterling. The following were the highest and lowest prices for copper during the last three years (in pounds sterling):

	Highest £	s.	d.	Lowest £	s.	d.
1911	63	18	9	53	8	9
1912	79	18	9	60	17	6
1913	77	7	6	62	3	9

During 1913, the lowest average monthly price was in July (£64 5s. 11d.); in December it was £65 5s. 7d. For the first half of 1914, the average monthly prices were as follows (in pounds sterling):

	£	s.	d.		£	s.	d.
January	64	8		April	64	17	4½
February	65	8	5	May	63	5	10
March	64	8	1½	June	61	9	2¾

In the last days of July, just as the markets were beginning to be troubled by the prospect of an actual conflict in Europe, copper sold, at London, for £56 cash and £57¼ on time. The position of the world's visible supply has varied: on January 1, 1912, it was 102,000 metric tons, falling to 83,400 tons on December 31 of the same year; it then stood successively at 89,100 tons on January 1, 1913; 66,200 tons on December 31, 1913; 50,200 tons on April 1, 1914, and 55,600 tons on May 1, 1914.

Lead.

The production of lead has, since 1907, exceeded a milion tons, as is shown in the table given below, and is drawing near the 1,200,000 ton mark; but, in 1913, the advance was of small proportions, although, in 1911 and 1912, it was very ample. Since 1912, Europe has regained its place at the head of the lead producing sections of the world, a position lost in 1910. The course of the American and European production has been as follows (in metric tons):

AMERICAN AND EUROPEAN PRODUCTION OF LEAD FROM 1904 TO 1913.

Year.	European Production.	American Production.	Year.	European Production.	American Production.
1904	445,500	403,400	1909	512,900	488,000
1905	461,200	397,800	1910	503,900	505,100
1906	465,500	422,500	1911	498,500	513,200
1907	471,100	443,500	1912	547,000	511,600
1908	513,000	419,500	1913	574,000	486,900

The diminution in the American production is due to a falling off in Mexico, on account of the internal troubles of that country, its production being estimated at only about 108,000 tons in 1912 and 62,000 in 1913, against 124,600 tons in 1911. The production of the United States jumped from 302,300 tons in 1904 to 387,300 tons in 1912 and 407,800 tons in 1913. The Australian production reached 107,400 tons in 1912 and 116,000 tons in 1913, but did not succeed in regaining the figure of 1904, the best if the decade, which was 119,400 tons. In the production of Europe, two countries dominate,—Spain and Germany. The former has witnessed an increase in production from 186,700 tons in 1912 to 203,000 in 1913, against 177,800 tons in 1904. As for the latter, its output has risen from 137,600 tons in 1904 to 176,600 and 181,100 in 1912 and 1913, respectively. The French production has jumped from 18,800 tons in 1904 to 31,100 tons in 1912 and 28,000 tons in 1913. The English figures have remained almost stationary, although making trifling gains, as follows: 24,400 tons in 1904, and 29,200 and 30,500 tons in 1912 and 1913, respectively. The Belgian production has increased from 23,500 tons to 58,000 tons in 1913, etc.

Here, as was seen in the study of copper, the United States are at the same time the largest producers and the largest consumers of lead. During the past year, they absorbed 401,300 tons, out of a world's consumption of 1,196,200 tons. The increase in consumption in 1913 was slight, as 398,400 tons was consumed in 1912, against 364,400 in 1911 and 297,300 in 1904. In Europe, Germany's requirements amounted to 223,500 tons, out of a total European lead consumption of 713,900 tons, which compares with 622,200 tons in 1904. Germany, in 1904, consumed only 175,800 tons, while Great Britain made use of 237,100 tons, a figure which has not since been equaled in that country. The English figures for the last four years are: 208,400 tons, 198,300 tons, 196,300 tons and 191,400 tons. France, on the other hand, had in 1913 the record consumption of the decade; from 82,200 tons in 1904, the French consumption has increased to 104,700 tons in 1912 and 107,600 tons in 1913. The Russian consumption has jumped from 40,800 tons in 1904 to 58,800 in 1913; the Belgian consumption from 28,000 tons in 1904 to 42,900 in 1913, as compared with 44,900 tons in 1912.

PRODUCTION, CONSUMPTION AND AVERAGE ANNUAL PRICE OF RAW LEAD FROM 1904 TO 1913.

	1904.	1905.	1906.	1907.	1908.
Production of raw lead (in tons of 2,200 lbs)	970,400	968,800	984,000	1,015,400	1,054,800
Consumption (in metric tons)	950,000	968,200	991,800	1,007,900	1,046,400
Average annual price at London (pounds sterling)	11.19.8	13.14.5	17.7	19.1.10	13.10.5
Value of the production in millions of marks (23¾ cts.)	233,800	267,200	337,000	389,800	286,800
	1909.	1910.	1911.	1912.	1913.
Production of raw lead (in tons of 2,200 lbs.)	1,087,300	1,127,000	1,136,000	1,181,800	1,186,700
Consumption (in metric tons)	1,079,000	1,114,900	1,149,200	1,201,800	1,196,200
Average annual price at London (pounds sterling)	13.1.8	12.19	13.9.2½	17.15.10½	18.6.2
Value of the production in millions of marks (23¾ cts.)	236,000	263,500	318,600	422,800	436,900

The above table shows that the highest average annual price for lead during the last ten years was in 1907. It is necessary to go back to 1877 to find an average annual price of twenty pounds sterling. During that year the average annual price of lead per

ton of 1,016 kilograms at London was £20 14s. and from that decreased to £9 11s. 6d. in 1894, then increasing again to the 1907 figure, which is the highest of this last period. It is worth noting the fact that after the average annual price of lead had on various occasions been above £20 between 1853 and 1866, the course of prices fell to £19 11s. in 1867; £19 6s. in 1868, £19 1s. 6d. in 1869, £18 13s. in 1870, and £18 2s. 6d. in 1871. Then, between 1872 and 1877, the average annual figure again climbed above £20, with a maximum in 1873 of £23 2s. 6d.

The average monthly prices of lead at London for the first six month of 1914 were as follows: January, £18 19s. 10d.; February, £19 2s. 8d.; March, £19 2s. 2½d.; April, £17 19s. 9d.; May, £18 4s. 8½d.; June, £18 13s. 10¾d. During the last days of July, lead was quoted at £19⅛.

The study of zinc, tin, aluminum and nickel will be taken up in another article.

INDUSTRY, COMMERCE AND FINANCE

Commercial Failures in August.—Commercial defaults during August, according to statistics compiled by R. G. Dun & Co., numbered 1,272, with liabilities aggregating $43,468,116, an increase as compared with the totals of the same month for several years back. In August last year there were 1,145 failures for $20,848,916; in 1912, 1,102 for $16,153,166; in 1911, 926 for $11,116,631, and 919 in 1910 for $12,442,063. In number, however, there is some improvement as contrasted with the preceding months this year, except as to May and June, and while the amount involved is much in excess of any month except June, when the Claflin suspension occurred, the returns are very much distorted by comparatively few defaults with exceptionally large indebtedness.

In the following table comparison is made of the number of commercial failures in the United States, covering three years, by leading classes of trade, and the liabilities reported in each class for August this year:

	Number			Liabilities.
Manufactures.	1914.	1913.	1912.	1914.
Iron and foundries	7	11	4	$60,360
Machinery, etc.	23	23	10	10,667,845
Woollens, etc.	6	4	1	373,816
Cotton and lace	..	2	3	.....
Lumber, etc.	26	33	28	634,763
Clothing and millinery	53	47	43	536,244
Hats and gloves	7	8	6	91,433
Chemicals and drugs	9	2	2	96,189
Paints and oils	..	3	1	.....
Printing, etc.	9	25	15	64,514
Milling and baking	21	19	26	179,783
Leather and shoes	10	7	5	153,428
Liquors and tobacco	11	7	8	365,312
Glass, etc.	14	7	9	493,785
All others	131	133	124	2,451,498
Total manufacturing	327	331	284	$16,168,970
Traders.				
General stores	83	87	78	$558,960
Groceries and meats	213	214	216	1,726,745
Hotels and restaurants	54	34	48	448,886
Liquors and tobacco	76	72	69	529,014
Clothing and furnishing	105	63	61	1,130,555
Dry goods and carpets	52	47	50	788,640
Shoes and rubbers	25	25	25	175,380

Hardware and stoves	18	25	18	201,379
Chemicals and drugs	45	32	25	299,312
Paints and oils	3	3	2	4,500
Jewelry and clocks	31	21	21	168,850
Books and papers	6	9	7	90,069
Hats and gloves	3	5	6	33,290
All others	127	129	110	1,702,125
Total trading	868	781	765	$8,410,833
Brokers and agents	77	33	53	18,888,313
Total commercial	1,272	1,145	1,102	$43,468,116

Foreign Commerce of United States in Fertilizers in 1913-1914.—The complete figures have recently been given out by the United States Department of Commerce for the imports and exports of fertilizers and of materials used in the manufacture of fertilizers, for the governmental year 1914 (ended June 30, 1914). The figures, with comparison for 1912-1913, are as follows:

IMPORTS OF FERTILIZERS AND MATERIALS FOR FERTILIZERS.

	1913		1914	
Fertilizers.	Quantity.	Value.	Quantity.	Value.
Bone dust and bone ash, tons, free	33,337	$801,713	41,450	$1,034,636
Guano ..... tons, free	19,075	340,915	21,887	755,833
Kainit ..... tons, free	466,795	2,154,977	541,846	2,579,619
Manure salts ..... tons, free	171,802	1,794,058	261,342	2,767,241
Potash, n. e. s.:				
Murate of ..... tons, free	201,220	6,782,056	237,886	7,915,523
Sulphate of ..... tons, free	42,745	1,753,485	45,139	1,897,740
All other substances used only as fertilizers ..... free	.....	3,300,833	.....	6,199,554
Totals		$16,928,037		$23,150,146

EXPORTS OF FERTILIZERS AND MATERIALS FOR FERTILIZERS.

	1913		1914	
Fertilizers.	Quantity.	Value.	Quantity.	Value.
Phosphate Rock, ground or unground, not acidulated:				
High grade hard rock.... tons	494,200	$4,942,000	475,335	$4,753,350
Land pebble ..... tons	777,898	4,577,962	1,000,630	5,857,969
All other ..... tons	794	4,127	1,906	6,516
All other fertilizers..... tons	74,834	1,875,000	61,601	1,360,903
Totals	1,347,726	$11,400,088	1,539,472	$11,978,738

* * *

Quicksilver Production in the United States in 1913.—The quicksilver industry in the United States broke a record last year, but not an enviable one, for which the exception of that of 1908, the production last year was the lowest since 1860. Final figures from every producing district, according to H. D. McCaskey, of the United States Geological Survey, give a domestic output of quicksilver for 1913 of 20,213 flasks of 75 pounds each, valued at $813,171, against a production of 25,064 flasks, valued at $1,053,941, in 1912. The decline was due partly to the large foreign output for the last few years, a dull market, and a general lowering of prices.

Producers report 154,033 short tons of ore mined and available for treatment in 1913, against 166,564 tons in 1912, and the reduction of 136,278 tons, against 155,693 tons in 1912.

California, as usual, was the largest producer in 1913, with 15,591 flasks, valued at $627,228, a decrease from the output of 1912 of 4,933 flasks in quantity and of $235,806 in value. The total value of the production of quicksilver in the State from 1850, the date of the earliest output, to the end of 1913 has been $95,902,923. The quicksilver output of Nevada in 1913 was 1,645 flasks, valued at $66,178.

* * *

United States Lime Output in 1913.—The manufacture of lime in the United States in 1913 broke all previous records, the production amounting to 3,595,390 short tons, valued at $14,648,362, according to R. W. Stone, of the United States Geological Survey. This was an increase over 1912 of 65,928 tons in quantity and of $678,248 in value. The average price per ton in 1913 was $4.07, as compared with $3.96 in 1912 and $4.03 in 1911. While Pennsylvania is the largest producer, the output of this State is only 2.36 per cent of the total, indicating the wide distribution of the industry; in fact, forty-four States reported to the Survey a production of lime in 1913.

Lime used in building operations represents nearly a third of the total output, but large quantities are sold to chemical works, sugar factories, tanneries, etc., as well as to farmers for broadcasting on agricultural land.

INSURANCE

Articles on the Theory, Practice and Experience of Insurance.

Notes on Insurance, American and Foreign.

Items of Insurance News.

ON this page of last week's issue of THE MARKET WORLD AND CHRONICLE attention was called to the vast new problem which fire insurance companies will this year have to meet in the matter of the insurance of some 4,000,000 or 5,000,000 bales of the cotton crop which it is expected will not be exported as usual, but will be stored in warehouses and held on farms in the United States. During the past week, developments have come rapidly in this connection, and it is beginning to appear that the questions to be decided will be most intricate and difficult. As the cotton crop begins to be ginned earlier in Texas than in any other State, it is only natural that the first determinations of the fire insurance companies should have been called for in that State. At the very start, it is evident that the companies are going to be exposed to a cross-fire and that they will run the risk all the time not only of heavy losses in cotton fires, but also of violent denunciations from leaders of farmers' unions and other self-constituted leaders and advisers of the Southern cotton producers. There is to-day no market for the greater part of the cotton that is being ginned in Texas, and no criterion of its real market value. All the cotton exchanges in the world are closed and consequently there are no authoritative quotations of the price of cotton. American spinners are buying a little cotton from hand to mouth and a few trifling lots are going for export. But the sale of each individual lot of cotton is a matter of private barter, and prices vary by from ½ to 1 cent per pound at points scarcely 50 miles apart. Most of the cotton that is being ginned is either perforce hauled by the farmers back to their farms or is put in such warehouses as are available. And this is only the beginning; before the end of the present month ginning will be general over the entire Cotton Belt and millions upon millions of bales will be held somewhere and by somebody, with the expectation that fire insurance can be obtained upon it, in order that the banks may advance money upon its security. The representatives of the farmers are violently asserting in every direction that this cotton is worth 12 cents per pound, or $60 a bale, and that banks must loan upon it and insurance companies insure it upon this basis. On the other hand, cotton has been bought in some quantity in Texas this week at one-half this price, and no competent cotton merchant would assert that in the present posture of affairs it would be safe to pay as much as 7 cents a pound, or $35 a bale for it. It is virtually certain that unless the Government, the bankers and the cotton trade can come to some dependable basis for a loan value of cotton, the price before the end of October must decline much farther, perhaps to 3 cents or 4 cent a pound,—i. e. $15 or $20 a bale.

It is, of course, not supposable that any decision reached by the fire insurance companies with regard to the insurable value of cotton is fixed and unchangeable. They will alter their basis as fast as conditions compel them so to do, though they will certainly find that as the basis they make declines the violence of the denunciations of them will increase, and in all probability every kind of attempt will be made to get legislative action on the subject, so as to put them in a position where they must in affect make their policies valued policies, without co-insurance clause. The agitation in the South over its predicament with its cotton crop is not unnaturally intense; and Southern communities generally will look with hostility upon any attempt to restrict their cotton insurance, whether in the matter of price or in any other way.

As an illustration of what the fire insurance companies are already doing in the premises we append the instructions given by the Royal to its agents, although with the reservation that the now dangerous price limit of 9 cents per pound may already have been revised. The instructions are as follows:

Insurance on Cotton—Season 1914-1915.

On account of the war in Europe, it will not be possible for some time to dispose of cotton as promptly as heretofore. The cotton exchanges, both in America and abroad, are closed, and in consequence there is no reliable market where the price of cotton is fixed from day to day.

In view of same, and for other reasons, it is necessary for underwriters to insure cotton on a very conservative basis. In accepting cotton for our account, therefore, please do not insure it for more than a total of nine cents a pound, based upon middling cotton. This valuation will be accepted by us as the basis in applying the full co-insurance clause, in case of loss, until the cotton exchange reopens.

All policies covering cotton under policies or certificates must have attached to them the fololwing clause:

"Notice is hereby given that in the event of loss under this policy, this company has the right to replace with cotton of like kind and quality the cotton that may be changed or destroyed by fire as provided for under the printed conditions of the policy."

Your customers and banks should be informed of this fact, so that no misunderstanding on the subject will occur in case of fire. * * *

At this juncture, you will doubtless agree with us that it is very important that cotton policies should only be issued to reliable parties who have banking facilities and can borrow, if necessary, such an amount of money on each bale of cotton as the bankers are generally advancing this season. * * *

Please understand that no mention of nine cents per pound as the value of the cotton is to be made in the policy or certificate. The amount of insurance which is to be written, however, should be based upon this figure, so that the assured will not take out more insurance than he can collect, and at the same time he should maintain insurance equal to the full value of the cotton based upon the price of nine cents per pound. The same forms should be used as heretofore for insuring cotton, the only difference being that the rider, as herein quoted must be made a part of the contract.

A RAILROAD MAN'S VIEW OF ADJUSTING PERSONAL INJURY CLAIMS

By H. B. Hull*
Chief Claim Agent, Illinois Central

I KNOW but one rule that may be safely followed in the adjustment of personal injury claims, that negotiations should be conducted upon the high plane of openness and fairness. In adjusting a claim, it is of paramount importance that every word and act of the claim agent's should be such as to withstand at any time the closest scrutiny under the light of day. A railroad company, with its property constantly exposed and subject to attack, must for its protection and defense rely upon its own reputation for fair dealing with its employes, patrons and the public. The deportment of its claim agents, who are constantly in touch with the public, has much to do with placing the reputation of a railway company. If they go about their work inspired by high and honorable resolutions, their efforts will not only be rewarded as they go along, but will assist most materially in establishing for their company a good name, which is the most valuable asset a railway company can have and which, when once enthroned, is as immutable as virtue and truth.

Assume, for instance, that you have a seriously injured person at some hamlet upon your line, far removed from the influences which are always antagonistic to the company in the handling of its claims, and that he is unadvised of his rights and imbued with an abiding faith in the fairness of the company and willing to trust his case in the hands of the claim agent, and that you have it in your power to go to that man and conclude him in an inadequate settlement, and thus save your company a substantial sum of money in that particular case. I affirm that it would not only be unconscionable to overreach that claimant, but that it would also be unprofitable to your company. The dust of the community would scarcely be off your feet till the doctor, the banker and the prominent citizen would get together on the street corner and discuss the result of your visit and the entire community would soon be condemning your railroad, and properly so. Almost in the twinkling of an eye you had encompassed enough to cause your company to be hated and despised in the community where the settlement was made, and to render it certain no more settlements could be made there. A corporation can only act through its agents, and unless their acts are scrupulously correct they deserve to be condemned.

Contrast the situation which I have attempted to describe with what might have happened had you gone to the injured man in a kindly way and explained that you were representing the railroad and that if he were uncertain as to his rights, that he had best call in two or three of his friends upon whom he would ordinarily rely for advice in a business transaction, and ask them to assist him in arriving at a conclusion as to what would be a proper sum for him to accept in compromise of his claim. In my humble opinion, the railroad gains much in closing a compromise in this manner. It not only satisfies the injured man, but it satisfies his friends and acquaintances, the doctor, the banker and the prominent citizen, who immediately become a potent influence in a community against personal injury litigation.

The claim agent who makes a settlement for the smallest sum is not always the best claim agent. He invariably has many "knockers" on his territory and lots of litigation against his company, whereas the claim agent who exercises good judgment in determining the proper amount to pay has everybody helping him with his cases, and besides, he smooths the way for a pleasant relationship between his company and its neighbors in other and perhaps more important matters. I believe there is as much danger of paying too little as there is in paying too much in cases where the injured person is friendly and inclined to permit the claim agent to name the amount. The art of the business is in being able to survey a situation and decide upon a fair and proper sum to pay. Settlement should be upon a basis so fair as to stand four square to all the winds that blow. But the friendly cases are in the minority, and growing fewer all the time.

In handling the other class of cases, where the claimant is unreasonable and has been listening to the siren song of the damage suit lawyer and his agent, who, before they are employed, are always against a compromise at any figure, I believe the best method is to locate the influences that would naturally control the injured person and work through that source. There is a key to every situation. The difficulty is in finding it.

It is almost unbelievable to what extent the damage suit lawyer and his agents are able to poison the mind of the injured person against the claim agent and the company. No matter how good intentioned you may be toward the injured person, no matter if you be willing to pay more than could be recovered net at the end of a lawsuit after months, if not years, of waiting, it is an uphill job at best to dislodge in his mind the glittering hope of drawing the prize held out to him as an inducement to sue, but it is well to keep on trying and not give up. The claim agent who is easily discouraged and quails in the presence of difficulty is not made of the right kind of stuff to do successful claim work in this day and age. If he perseveres he will succeed oftener than he fails. The claim agent must be able to tell the injured person of settlements he has made that were fair and just and satisfactory to all parties concerned. He must also be able to tell something about cases the damage lawyers will not talk about, the litigated cases that terminated disastrously to injured persons.

A railroad corporation should pay an injured person, in a liability case, about what he could recover net to himself at the end of a lawsuit, figured on the best information obtainable, and only attempt to save attorney's fees and court costs in adjusting claims of serious injury. Twenty-five per cent of the total paid out by the average railroad in a year and charged to the personal injury account is waste; that is, it goes to the payment of court costs, witness fees and into the pockets of the damage suit lawyer and his organization. If we could save that for the railroads, it would be considerable and would fully satisfy them, and besides, what a blessing it would be to the injured people and their families, if we could only make them see it. Our mission, as I view it, is to starve out the damage suit lawyer and put him out of business. His sinister shadow falls across the pathway of nearly every unfortunate with a claim against a corporation, and he is doing as much in this country to-day to array employe against employer and stimulate unrest and discontent as any other factor, and why? Simply that he may use the cripple as a vehicle to enrich himself, and with what result? In the cases he is fortunate enough to win, he takes out of the sums recovered his dividends and the expenses ranging from 33⅓ to 50 per cent. He then has no further interest in the cripples and they are cast out into the world with perhaps a few thousand dollars at best and no capacity for taking care of it, and, as a rule, they invest it in some little business and the inevitable happens. They are the familiar fellows you see on the street corners in all of the large cities of the land.

Address at the twenty-fifth annual convention of the National Association of Railway Claim Agents, St. Paul, Minn., May 21, 1914.

The policy of railroads is to take care of maimed employes in positions which they can fill, wherever it is possible to do so, and this is done entirely separate and apart from any settlement that is made. I would estimate that 75 per cent of maimed employes who do not sue are provided with positions which, in most instances, they hold as long as they live, clinging to their employers, like the ivy to the oak, for succor and support, and these men usually get about as much net out of their claims as if they had sued, and oftentimes more, but the damage suit lawyer does not get his, and there is the rub.

I am an optimist and can see signs of the dawn of a brighter day for the railroads and their injured employes. There never was a time in our history when railroad managements were so thoroughly alive to the situation as they are to-day. They are accustoming themselves to think of the distress of human life and how to relieve it. Evidence of this is seen in the pensioning of old employes, in the building and equipping of hospitals, in the liberal sums they are willing to pay in compromise of bona fide personal injury cases, in the sincere efforts that are made to provide the maimed with employment where left free to work the matter out, and in many other ways. They are approaching this matter upon a basis of humanity and sympathy, seeking the good and comfort of the unfortunates for whom they feel a sense of responsibility, a deep-rooted interest born of sympathy. Under these conditions we should not have much difficulty in adjusting our personal injury claims, especially with employes. In our fight to protect injured employes and prevent them from being literaly torn away from their employers, their real friends, by self-serving damage suit lawyers and their agents, already drunk with success, and greedy for more coin of the realm, we should stand upon the broad foundation of justice and righteousness between man and man and let it be known far and wide and back it up by sincerity of purpose in our every act. I sympathize, of course, with the poor fellows who are lured away through the subtle methods of the trickster, but after all, good comes out of it in that others are able to profit by the sad experience of unfortunates who are willing to turn against a friend and faithful employer anxious to do a good part by them.

We have still another class of personal injury claims to deal with, the most difficult of all to handle. I refer to the fraudulent claims. In nearly all of these cases the claimants have some bodily infirmity which they try to capitalize by palming it off on the railroad as having resulted from an accident. They invariably select a time and place to pull off the "accident" under circumstances which would render the railroad liable in damages if an injury occurred. They have little difficulty in finding doctors who are willing to be fooled for a stipulated contingent fee. Frequently the desirability of adjusting claims of this character is suggested in order to reduce an uncertainty to a certainty and save the costs of litigation, but the difficulty is, where one of these fraudulent claims is adjusted, the effect is to stimulate more claims, and instead of making progress through such a policy, we actually slip the other way. We make two blades of grass grow where but one grew before, but it is the wrong kind of grass. If we do not settle the game is played to the limit, there is a trial, and sometimes the railroad is mulcted in damages, but oftener the fraud is exposed before the goal is reached. Whatever the result, I am convinced it is wise to exploit this class of cases before the public as much as possible. If we compromise them as a mere matter of temporary expendiency, the railroad becomes a party to the fraud. If a robbery is to be perpetuated, let some one else be responsible for it.

The fact that railroads will at time capitulate and buy their peace by adjusting fraudulent claims, I verily believe, is responsible for as many "railway spines" and "nervous wrecks" as are collisions and derailments. A street railway company in a certain Southern city adopted a policy of settling all claims and keeping out of court. Fraudulent claims increased at an alarming rate. The policy was changed and all frivolous and fraudulent claims were fought out to the end. There were so many suits that nearly all the qualified jurors sat upon some of these cases and became educated to look for the fraud and injustice of the litigation and the result was that the juries put an end to the system. They almost carried it to the other extreme and it became difficult for a man with a bona fide case to get justice. All cases were looked upon with suspicion and the honest claimant suffered from the odium cast upon him by the crook.

If the railroads of this country, acting in concert, should adopt a policy of fighting all fraudulent, suspicious and frivolous cases, they could in time educate the people just as did the street railway company in the city referred to. It would be the same proposition except on a larger scale. Our difficulty now is that we too often submit to wrong and injustice in order to gain a temporary advantage. We lose the benefit and effect that would flow from exploiting all the cases that lack merit. We should take up the time of the court and its machinery, and of juries, in trying this class of cases. Too often the suggestion is made to the claim department: "We can settle that case for less than it will cost to try it. Why not?" The fact that a plaintiff is willing to do that is a confession of lack of merit in the claim. If the claim department submits and the claim is paid, the curtain is drawn and the public never knows anything about the transaction. We should make a painstaking effort to separate the wheat from the chaff. If railroads did not pay out so much money to those not entitled to it, they would have more to pay to those that are entitled to it, and if the courts and juries had an opportunity to know the situation as it is, they would help us make the division, but so long as railroads do not take advantage of the oportunity which is theirs, they will never know, I feel that meritorious claims should be adjusted at reasonable, even liberal figures, but that all frivolous, fraudulent and suspicious cases should be resisted and advertised to the fullest extent. By persistently carrying out such a policy, the public would eventually understand it was unnecessary to sue a railroad in order to get justice.

In many instances there has been a disposition on the part of interested persons to give out unreliable information relative to the amounts recovered in personal injury lawsuits and injured persons frequently confront claim agents with this false information. In one case which Mr. Failing handled, a death case of non-liability, in which he offered to pay a substantial sum, suit was filed and there was a verdict for $20,000. This was written up in the newspapers and advertised quite extensively. Later on the case was settled with the attorneys representing the plaintiff for one-half the amount he had originally offered direct to the beneficiary. Of course, there was no publication of the closing transaction, and claimants confronted him so often with the newspaper story of the verdict rendered by the jury that he found it necessary to photograph the newspaper clipping and the release for the amount that was actually paid, which was effective in convincing claimants of what really did happen to the case. We have had a few cases on our line where injured persons recovered damages at the end of the law and later accepted employment as runners for damage suit lawyers. One of the arguments they used in soliciting cases was what they had been able to accomplish through litigation of their own claims. We discovered that they

were distorting the facts. One man in particular, who had recovered $5,200 in St. Paul for the loss of a leg, was reporting it around to injured employes that he secured $8,000. We found it necessary to obtain certified copies of the judgment of $5,200 which was affirmed by the Supreme Court and distribute them in the community where this man had given out the false information. We have pursued the same course in a number of other cases.

It is true that the publication of large verdicts at initial trials creates a wrong impression in the public mind, and especially upon the minds of prospective claimants. Also, men who get upon juries read these reports and are doubtless influenced by them to some extent in arriving at their verdicts, but I do not know of any way this situation can be remedied, except where these reports are mentioned by claimants in the course of negotiations for settlement, and in those instances Mr. Failing's scheme of photographing the release and the newspaper report, I think, is good, as well as the other plan of securing certified copies of judgments for distribution.

"Keeping injured persons in line for settlement" is not an easy task. Here is where close co-operation between the claims agent and other departments of the service fits in best. On the railroad which I have the honor to represent (and I think the same is true of all other lines) the practice is to take just as good care of an injured person as it is possible to do—furnish the best of surgical treatment, nursing and hospital service, and when he is sufficiently recovered to be able to talk business, and inclined to do so, to go to him and have a heart to heart talk about his case and request him to hold himself free to deal direct with the company when he is ready to consider the matter of adjusting his claim, explaining, also, that in case of his failure to reach an agreement he would be left upon just as high ground to pursue another course, should he desire to do so, as he was upon in the beginning. It does not require much intelligence for one to understand that a compromise is preferable to a lawsuit and our reasonable request, freighted with much importance for the weal or woe of the injured person, is usually granted cheerfully by claimants of ordinary intelligence, and always by those of higher mentality. The weak-minded, those who are not able to think for themselves, are the ones most likely to fall a willing prey into the outstretched arms of the damage suit shark, for they can be handled by him like clay in the potter's hands. In many of these cases suit is filed without affording the company an opportunity for a hearing. Nobody ever heard of a business man, or a man of affairs, suing an individual, or a corporation, without first rendering a bill and making at least a reasonable effort to collect it; nobody ever heard of a lawyer sending an agent to a man of brains for the purpose of trying to induce him to file a suit in advance of exhausting every effort to effect a friendly setttlement. The business of the damage suit scavenger thrives among the weak and drooping, and how to hold that unfortunate class in line for settlement is, indeed, a problem.

THE PRESENT SITUATION AS TO GOVERNMENTAL WAR RISK INSURANCE

UNDER the provisions of the War Risk Insurance Act, passed by Congress August 31 and signed by President Wilson on September 2, a bureau is created in the Treasury Department to insure against loss or damage arising from war, "American vessels, their freight and passage moneys, and cargoes shipped or to be shipped therein." The principle underlying the Act appears to have met with general approval in business circles. Not unnaturally, to be sure, it has been pointed out in more than one quarter that such legislation tends toward undue governmental control of matters best left to private enterprise. Perhaps as weighty an exposition of this point of view as has appeared in the course of the discussion is to be found in a recent editorial in the New York "Journal of Commerce," where it is argued that "such a bill would not be justified by any condition but the emergency of such a war as is now waging between nations with which we have had close commercial relations. As it is, it does not have the same justification as the similar action taken by governments of the nations engaged in the war, whose vessels are liable to seizure by enemies, as those of a neutral nation are not. In any case, the Act of Congress should be strictly limited by its terms to the duration of the present conflict and such time as may be required for the final settlement of claims." It may be noted that an even more determined opposition, based on similar grounds, has developed in the case of the proposed purchase by the United States of steamships for the overseas trade.

It would not seem necessary to push too far or too strongly in this line of thought. The needs of the present are numerous and imperative, and they should not be accentuated by opposition, largely theoretical in character, to governmental measures which will be recognized, after the needs have been met, as having arisen purely by reason of a grievous emergency, and not as establishing principles at variance with American ideals of the function of government.

Certainly, the United States is not the only genuinely democratic country that is adopting precisely the same expedient. The French Government, in order to prevent any undue disturbance of foreign trade, and to facilitate the importation of foodstuffs, has decided, under certain conditions, to guarantee the payment of insurance on ships for which war risks have been paid. The Government will guarantee up to 80 per cent on French bottoms and the whole value of cargo imported under the French or an allied or neutral flag. The full value of cargo exported under the French flag will likewise be secured.

In England the establishment of the War Risks Office has brought about a greatly improved condition in the entire field of the country's foreign commerce. According to "The Economist" the marine insurance market was paralyzed almost immediately upon the outbreak of the war. How rapid was the rise in marine insurance rates in London will be gathered from the following figures, showing rates charged on voyages to the United States and other nearby countries:

July 28	5s. per cent
July 31	60s. to 80s. per cent
August 4	10 guineas to 15 guineas per cent
August 6	20 guineas per cent

Naturally it was impossible for shippers to meet such rates, and the War Risks Office was called into being by insistent public demand, and established an initial note of 5 guineas per cent. This was reduced on August 7 to 4 guineas. On August 14 the rate had fallen to 3 guineas.

In view of the problems which will inevitably face our new War Risk Insurance Bureau in the Treasury, it will be of interest to consider the difficulties already encountered in England. "The Economist" describes them as follows:

"From the peculiar conditions of the past ten days some curious paradoxes have resulted—chief among them being the higher rates of premium paid on cargo in neutral steamers. It arises in this way. No cargo can be insured by the State unless the hull which carries it is also insured. As no foreign hull is insured with the Government, it follows that cargo carried in foreign steamers does not fall within the Government scheme, and must be taken by the open market. Thus (the Government insurance being unavailable)

there is less competition for cargo in neutral bottoms, and individual underwriters can quote what rates they like without being told that "the business will go to the State." Hence comes the strange result that while cargoes in British steamers were being insured at 4 guineas per cent, 6 guineas and 7 guineas per cent were being paid on cargoes in Dutch and Japanese hulls. Recently the disparity has tended to disappear, the rate on neutrals being distinctly weaker, and merchandise to the East in Dutch or Japanese steamers has been insurable at 3 per cent. That fairly stiff premiums should be charged on neutral steamers is not unreasonable, for in these days neutrals may at any moment become belligerents, but it is unnatural to charge actually a higher rate on the steamers of Holland, which is not at war, than on the steamers of Great Britain, which is. The disparity of rates is really another porof of the steadying influence of the State scheme, which has had so striking an effect on underwriters wherever they are in competition with it.

"If these are the rates, what of the losses and the captures? Here it is difficult to speak with any certaity. A large number of German vessels have been brought into British ports, and some have been taken while lying in British harbors. Most of these steamers we know, though their aggregate value cannot be computed. But we do not know, and for a time, probably, we shall not know, the number of British ships captured in German harbors or destroyed by German cruisers at sea. How many of our merchant steamers were lying in Hamburg, Bremen and the Baltic ports at the time of the declaration of war has not been stated officially, and there is no way of arriving at an unofficial statement, while if any of our trading vessels have been sunk at sea the fact will naturally not be known for some time. It is to be hoped, and we may well believe, that the losses from this cause in the Atlantic and the Mediterranean are small, but at present nothing is known, and some of the steamers may actually be losses before the insurance on their cargo has been effected. Happily, the big specie shipments have arrived safely, and the millions of liability borne by the London market have not produced a loss of any kind.

"Already difficult problems of law are arising out of captures, and lawyers and average adjusters are being bombarded with thorny problems for their decision. For example: (1) English cargo in a German steamer captured at Antwerp. Will that be a loss to the British owner? (2) English cargo at sea consigned to Germany in German vessels, but not yet paid for by the German customer. Will that, if captured, be a loss to the British owner? (3) English cargo in a German steamer that puts into Lisbon. Will that be a loss to the British owner? They are difficult points, and so far no one has solved them satisfactorily. Whatever the ultimate solution, it is clear that under modern conditions the capture of private property at sea is a far more tangled business than most people had realized before the war broke out. Whatever the strategical advantages of hampering German commerce, it is impossible to carry out the systematic capture of German steamers without injuring either British underwriters or British merchants."

In closing, it may be stated that immediately upon the signing of the War Risk Insurance Bill by President Wilson, an announcement was made by Secretary of the Treasury McAdoo to the effect that he had appointed as Director of the Bureau, Mr. William C. De Lanoy, of New York City,—a member of the New York firm De Lanoy and De Lanoy,—who has had an insurance experience of some thirty years. As assistant to the Director, Mr. J. Brooks Parker, of Philadelphia, has since been appointed. Further, the Secretary of the Treasury has designated, to serve as an advisory board, Mr. William Wallace, of Boston, Mass.; Mr. Hendon Chubb, of Jersey City, N. J., (a member of the New York firm of Chubb and Son); and Mr. William N. Davey, of New York City (of the firm of Johnson and Higgins). Secretary McAdoo has also announced that the new Bureau has been placed in the customs branch of the Treasury Department, at the head of which is Mr. Andrew J. Peters, Assistant Secretary of the Treasury (until recently Congressman from Massachusetts). The first work of the Bureau will be the preparation of policy and other forms; but this work is already well advanced and is expected to be completed within a few days. Applications for war risk insurance should be addressed for the present to the Director of the Bureau of War Risk Insurance, Washington, D. C.

DEVELOPMENT OF AUTOMOBILE INSURANCE

AT the Thirty-eighth Annual Meeting of the Fire Underwriters' Association of the Pacific, Mr. William M. Klinger, spcial agent of the Fireman's Fund Insurance Company, read an interesting paper on automobile insurance. Through lack of space we are unable to reproduce it here in full, but we give below Mr. Klinger's introductory remarks, which outline the inception and development of this branch of insurance. The extracts are reprinted by permission of the Association under whose auspices the paper was delivered.

* * *

The automobile was practically unknown fifteen years ago, and the few in operation at that time were curiosities to most people, and a matter of contempt to many. Since then, especially from 1902 to the present time, the motor vehicle industry has grown rapidly and its progress cannot be stopped; in the United States it has grown more rapidly than any other industry. It is interesting to note the growth of this branch of trade from year to year. Prior to 1904 statistics are not available; during that year there were built 22,000 cars; in 1905, 38,000; in 1906, 70,000; in 1907, 90,000; in 1908, 110,000; in 1909, 125,000; in 1910, 170,000; in 1911, 210,000, and in 1912, 300,000; while the output during 1913 is estimated to have been over 650,000 cars, with a value of over a billion dollars. The prospects for 1914 do not appear to be as encouraging. An official of a motor car factory, who is also president of the Automobile Chamber of Commerce, a National organization that numbers among its members all the leading automobile manufacturers of the United States, says:

"Business conditions, not only in this country, but throughout the world, are being affected by influences and economic conditions that are in the nature of a reaction and readjustment after a number of years of rapid expansion and development. The automobile industry itself has been an example of such development, and now has reached a point where continued startling increases in production are no longer necessary or justified. In ten short years it has wholly transformed one phase of urban transportation, and having accomplished that task, it can best ease up for a while, and supply normal demand, rather than try to force reluctant further markets. Some doubtless well meaning men are endeavoring to 'boost' the industry, as they term it, by exaggerating the present activity and future production of the big automobile manufacturing centres in a way that comes close to falsehood, and in doing so they complicate matters unnecessarily. What is needed above everything else is confidence, and lies and exaggerations, either pessimistic or optimistic, serve to destroy that confidence. The industry is strong and prosperous enough to require no false 'boosting.' There can be no wild and unconsidered development, based on mere hope and optimism. Its progress now must be based upon sound business

judgment, which means expansion and increase only where a sure market has been found."

From the foregoing statements it may be assumed that fewer cars will be manufactured this year, hence a corresponding reduction in premiums written.

The development of the industry has been a factor in establishing various branches of business, one of which is automobile insurance. It has developed to such an extent that to-day certain companies are exclusively engaged in writing automobile insurance covering the vehicle against every possible loss to which it may be subject, while other companies have organized special departments for this branch of underwriting. The development of automobile insurance has kept pace with the production of the motor car, and for purposes of comparison with present day conditions, will read to you extract from an article written by me for a motoring magazine published in April, 1906:

"At the close of the motoring season of 1905, it was the unanimous opinion of the most prominent manufacturers of automobiles that the year of 1906 would show a greatly increasing demand for their product providing it were possible to secure some adequate system of indemnity against the multiplicity of hazards to which motor vehicles are subject. Manufacturers, designers and engineers devoted much time and study toward the elimination or reduction of the natural hazards of automobiling. Many changes were made in the arrangement of the carburetor and commutator, resulting in a corresponding reduction in the number of explosions, but it is safe to say that the total elimination of fire hazard will never be reached.

"Several insurance companies in 1905 employed experts who gave this subject their undivided attention, and upon their recommendations engaged in writing automobile insurance. It may not be amiss to state that because of the underwriting of automobile insurance is due in a large measure he advance in the value of cars now being operated to the enormous amount of $250,000,000. Great Britain was the first country to introduce motor car insurance. In that country underwriters will assume the liability of every known hazard upon which a percentage of profit may be obtained. Companies were early organized in Great Britain to cover exclusively against loss or damage these risks, and extended the policies to cover damage through collision and claims for personal injuries sustained by owners and to third parties. Specific or general policies at the option of the applicant can now be secured in Great Britain. Specific policies include either the fire, collision or liability hazard, whle a general policy covers a combination of all risks. As the development of the automobile industry progressed in America, the demand for protection against the natural hazards to which the motor car is subjected became general, but the underwriters were skeptical about issuing a 'floating policy,' and did not believe that this clause of hazard could be scientifically underwritten. Through many years of experience they had successfully classified other insurable properties, but at first glance could not seen their way clear to assume risks of a 'special hazard' nature, upon which a classification had never been previously made. They figured that a building being a stationary object, a value could be placed upon it; the fire insurance inspector could periodically inspect it and determine its depreciation, according to use, age and occupancy; stocks of merchandise could receive like treatment, and rates could be applied according to the table of experience. Sea-going vessels could be valued by a marine company's surveyor; their ports of destination and hazards were known, and the cargoes had staple values. With this knowledge rates could be made accordingly. Automobiles, however, are of a very different character from the properties mentioned. They are migratory, without permanent place of storage, likely to be destroyed by the burning of the garage, by self-ignition, by explosion or lightning while in service on the road. Motor cars may be wrecked in transportation by railroad or water conveyance; they are readily pilfered or stolen. They are subject to rapid natural depreciation in value varying according to use and care. Stability of construction must be taken into account, and a further consideration must be given to the fact that cars depreciate in value, owing to a fickle public fashion that demands new models annually. Perhaps the principal objection which the old line companies had to assuming the risks incident to automobile insurance was the possibility of an accumulation of insured machines in any one garage, and the consequent danger of a single fire causing an exceedingly heavy loss. However, the manufacturing of motor cars having passed the experimental stage, the demand for protection by insurance from manufacturers, dealers and owners became urgent. The manufacturers claimed they had minimized the inherent hazard of self-ignition and explosion; the dealers insisted that insurance indemnity would increase the number of sales, and the prudent man would not invest if he could not protect his investment. With these conditions, companies entered the field and commenced writing automobiles under a floating form.

"Not only has the introduction of automobile insurance been beneficial to those directly interested in the manufacture, sale and use of motor cars, but it has also been responsible for the development of the country, notably in the Nevada gold fields. Owing to the extreme dififculty of penetrating the desert regions, mining men have been hampered in their prospecting expeditions. It was suggested that the most convenient and rapid mode of travel in Nevada would be by the use of the motor car, but owing to the physical conditions of the country it was necessary to employ high priced and substantially constructed cars. Those interested hesitated to make large investments in the purchase of automobiles unless the machines could be insured. Being in a position to protect themselves through the introduction of automobile insurance, the promoters are swarming the deserts in their motor cars, new and paying territory is being opened up, and Eastern capitalists are being directly interested by being taken to the scene of the properties in comfortable touring cars."

There were five companies issuing an automobile floater policy in 1905, fifteen companies were operating in 1910, while to-day there are probably sixty companies engaged in this class of underwriting, and others contemplate entering the field during this year. When the demand for automobile insurance arose, the several companies then operating issued a "valued" policy, the terms and conditions being principally those of a marine contract; the insured was compelled to carry 80 per cent of the cost of the car or become a co-insurer, but it was soon discovered that this system created a moral hazard. A dishonest claimant knew that disputes as to the value of a car in the event of total loss could not arise. It became obvious that cars of all makes depreciate from 20 per cent to 50 per cent a year, depending upon the construction, use and abuse, and it further became apparent that a change in policy form and rate was necessary. The insurance companies with head offices in the Eastern States and abroad, formed an organization known as the Automobile Underwriters' Conference, all underwriters of automobile insurance within the United States or Canada being eligible to membership. The objects of the organization are to serve as a medium of exchange of information, to secure the adoption of suitable and uniform policy forms and clauses; to make investigations and recommendations with the object of eliminating or reducing danger of fire and other casualties; to gather statistics and make investigations concerning hazards, as a guide to indemnity by its members; to furnish advisory rates of premium to its members,

covering general or special classes of business or individual risks, and to prevent giving rebates, it being understood that none of these objects would be obligatory where the enforcement thereof would violate the laws of any State or Territory. A standard form of policy was approved, known as the Conference valued form. This policy contained a clause reading, "The said automobile hereby insured (body, machinery and equipment) is valued at the sum insured." Another form known as the Conference non-valued form was also approved; a reduction in rate is allowed for the elimination of theft and valued policy clauses. The Pacific Coast Automobile Underwriters' Association, organized for similar purposes, has jurisdiction over Pacific Coast territory.

NOTES ON INSURANCE, AMERICAN AND FOREIGN

Investigation of Grain Dust Explosions by the United States Bureau of Mines.—That the same degree of care exercised in a mine to prevent the explosion of coal dust should be used in flour mills, grain elevators and grain products factories to guard against the explosion of grain dusts is the conclusion reached by experts as the result of a co-operative investigation made by the millers of the country and the United States Bureau of Mines. The milling industry in the last ten years has been visited by a series of mysterious explosions costing several hundred lives and hundreds of thousands of dollars in property. The climax came in June, 1913, when an explosion in a Buffalo, N. Y., mill killed thirty-three men and injured seventy. The millers, realizing that the Bureau of Mines men were experts on coal dust explosions, called upon them for assistance in a complete investigation, in order that future catastrophes might be avoided. David J. Price, of the Bureau of Mines, was assigned to the work under the direction of Dr. George A. Hulett, chief chemist of the Bureau, and Harold H. Brown represented the millers.

The mines experts declare that all dusts containing carbon are explosive under certain conditions and that immediate steps should be taken to safeguard against such. They describe a terrific explosion in a grain elevator and say: "We are forced to conclude that, if an explosion with such terrible force and violence could occur at this elevator, then the grain elevators of the country are at all times subject to the possibility of a similar occurrence if favorable conditions exist. Many milling men have maintained a false sense of security, and have felt that the elevators were not especially a source of danger; and that as long as an explosion did not originate in the grinding mill proper, they were reasonably safe. This explosion alone would seem to indicate sufficiently that the dusts created during the elevating and storing of grain are explosive and dangerous."

On the subject of the causes of grain dust explosions, the experts says: "At the present time in modern milling plants the use of an open flame light is positively prohibited, and is generally regarded as an element of very great danger. Many explosions have been traced to this source. The use of gas jets for lighting purposes, the introduction of lanterns or open lights into grain bins or dust collecting systems are very dangerous.

"Many violent explosions have occurred during mill fires, due to the presence of dust in large quantities. The flames and force from a fire produce sufficient concussion to jar the dust into suspension and initiates a very violent explosion.

"A large number of explosions in more recent years have been traced to the introduction of foreign materials into grinding machines. Particles of such materials, coming into contact with the grinding plates of the machines, produce sufficient sparks to cause an ignition of the dusts.

"It is necessary in mills and elevators for the workmen to determine at frequent intervals the amount of grain that the storage bin contains. A common practice is to lower a light of some kind into the bin to observe or measure the quantity of grain. Many explosions have occurred when open lights were used. The desired results can be obtained by lowering a 'tape' with a weight attached to the end, and the exact measurement can be recorded. When occasion renders it absolutely necessary to use a lamp of some kind in a bin, an approved type of portable electric lamp could be used. Electric bulbs in dusty atmospheres located near machinery where there is a possibility of the lamp becoming broken, or at points in the mill where workmen may strike the lamp, especially when carrying a projection of some kind on their shoulder, should be enclosed in strong wire guards or protectors, and it would be advisable to enclose each bulb in a vapor proof globe. An extra safety feature would be, whenever possible, to locate all fuses on light and power circuits, switches, and starting boxes at points where dust is not present in dangerous quantities."

The Re-investment of Moneys Derived from Life Insurance Policies.—Various methods have been devised, says the "Post Magazine and Insurance Monitor," of London, for dealing with the problem arising from the fact that in many cases the whole of the lump sum secured by a life assurance policy is not required at the moment when, by the advent of death or the lapse of time, it becomes payable. Payment by a limited number of installments—the right secured under the policy to purchase from the insuring office a life annuity at stipulated rates—are alternatives which readily recur to one, and another solution is that which the National Mutual Life Assurance Society is now rendering available to its policyholders and which is set forth in a circular recently issued relating to the re-investment of policy moneys.

The circular referred to naturally points out the three criteria by which the suitability of an investment under the conditions usually applying must be judged, namely, security of capital, satisfactoriness of interest yield, and capability of prompt realization without loss. Whether the money is payable to a wife on the death of her husband, or to an individual who has chosen endowment assurance as affording in itself a suitable (perhaps his chief) mode of providing for old age, it will often happen that the recipient is unable to judge as to how far a particular security meets the requirements. As the society points out, the stock exchange security which satisfies these three conditions does not exist. The so-called "gilt-edged" or trustee securities, in particular, fail to fulfil the conditions. They provide a regular income, but the yield is low, and the depreciation in their values since 1897 has been enormous, amounting in many cases to upwards of 30 per cent.

It is here that the society steps in, undertaking, in respect of each £100 of policy moneys left on deposit to (1) guarantee the capital against depreciation; (2) pay interest thereon half-yearly, on the 1st of March and 1st of September, at an annual rate lower by 15s. per cent than the gross yield on the society's funds (excluding reversions) for the preceding year ending 31st December; (3) return the capital intact on eight days' notice, or on one month's notice if the sum deposited exceeds £1,000. For some years past the yield on the society's funds has shown a steady increase, and as the rate to be allowed on deposits will depend on, and vary with, this yield, policyholders who become depositors will continue to participate in the prosperity of the society. For the year 1913 the gross yield of the funds was £4 19s. per cent, so that the rate to be allowed for the current year on sums left on deposit will be £4 4s. per cent per annum. Thus at a cost of 15s per cent the

claimants can do what in effect policyholders have done before them, placing on the broad shoulders of a society commanding the necessary financial skill and knowledge all the burden of finding suitable channels for surplus funds and thereby avoiding the incidental expense and anxiety which falls on the independent investor. The scheme should specially commend itself to executors and trustees who seek an investment of undoubted security, which produces an adequate rate of interest, requires no watching and may safely be left undisturbed.

* * *

Workmen's Compensation in South Africa.—The following is a brief outline, printed in the "Insurance Record," of New York, in regard to workmen's compensation and employers' liability, which came into force in South Africa by an act of Parliament in 1907:

"In the Transvaal a workman who has been injured in the course of his employment may choose one of two remedies. He may sue his employer for damages for the injuries sustained, under the common law, or he may claim compensation in the manner prescribed by the workmen's compensation act of 1907.

"If the workman decides to proceed under the common law, he must be prepared to prove that the employer, or some servant in his employ, has been guilty of negligence. Such negligence must be the direct cause of the injury. If the negligence complained of is alleged to be due to the act of a fellow servant, it must be shown, in order to render the employer liable, that the injuries were committed by the fellow servant in the course of his service, by the master's authority either expressed or implied. It must be clear that the servant doing the injury was acting in the scope of his employment.

"An employer is not liable for the acts of one who is not in his service, but is in the position of an independent contractor. An independent contractor is one who undertakes to produce a given result, but so that in the actual execution of the work he is not under the order or control of the person for whom he does it and may use his own discretion in things not specified beforehand.

"The servant who makes a claim must show that the negligence was the proximate cause of the injury. If, however, it is shown that the negligence of the master or his employe was not the immediate cause of the damage, but that it was occasioned by some negligence on the part of the plaintiff himself, then the plaintiff cannot complain, for he is said to have been guilty of contributory negligence. But in order that the plaintiff's contributory negligence should debar him, it must be shown that but for such negligence or lack of reasonable precaution or foresight on his part the injury complained of would not have happened, and damage would not have ensued. In South Africa a servant can recover from his master for injuries inflicted on him by a fellow servant acting in a common employment. It will be seen that in an action brought under the common law the servant or workman must prove negligence. If he makes claim under the workmen's compensation act, instead of proceeding under the common law, he need not prove negligence, but he must show that the injury arose out of and in the course of his work.

"Under the common law, the workman may claim any amount of damages. Under the Transvaal act the workman's claim to compensation, in the case of permanent injury, resulting in total disablement, is limited to three years' wages, or $3,650, whichever is the less; and in the case of permanent injury resulting in partial disablement, to the probable deficiency in earnings for the next three years, or $1,825, whichever is the less. Similarly, a workman's dependents, under the act, are limited in case of his death to two years' wages, or $2,432, whichever is less; whereas, their claim at common law may be unlimited.

"Under the workmen's compensation act it is the duty of employers to insure their employes, and it is from this source dependents or employes receive their compensation."

The British National Insurance Act.—A parliamentary paper gives the number of persons insured under the British National Insurance Act as 9,682,300 men and 4,077,100 women, a total of 13,759,400. Of these, 9,303,700 men and 3,965,700 women are in Approved Societies, 130,300 are in the army and navy fund, and 248,600 men and 111,400 women are deposit contributors. The average weekly receipts for the sale of stamps is about £359,200, and the amounts issued to approved societies and insurance committees approximately £191,300 and £105,300, respectively. Up to December 31, 1913, the total receipts for the United Kingdom under the Act amounted to £33,424,000. At the same date the payments under the various heads stood as follows: Issued to approved societies for benefits, £7,605,000; administration, £3,765,000; insurance committees for medical benefit, £4,502,000; sanatorium benefit, £801,000; administration, £252,000; deposit contributors in sickness and maternity benefit, £18,100; societies for investments or investment on their behalf, £937,000. The amount invested by the Insurance Commissioners through the National Debt Commissioners on December 31, 1913, reached a total of £15,263,000.

* * *

Fire Insurance Conditions in South Africa.—Consul E. N. Gunsaulus, writing from Johannesburg, South Africa, has made the following interesting report on fire insurance conditions in that city, which may serve as an indication of fire insurance conditions as a whole in that part of the world:

A majority of the insurance companies in Johannesburg are British concerns, which have agencies throughout the Union of South Africa. The general average of fire insurance rates, taken over the district of Johannesburg, cannot be said to be high. It is considered that the rates charged are really normal, but they vary somewhat according to the nature and type of building.

Brick dwelling houses situated within reasonable range of fire stations are charged at an average rate of one-sixth of 1 per cent on the amount of insurance.

Wood and corrugated iron buildings, brick lined, within a radius of three miles of a fire station, would be charged an average rate of two-fifths of 1 per cent; wood and corrugated iron, without lining, one-half of 1 per cent inside of the three-mile radius, while the rate on houses of this type outside the radius would be three-fifths of 1 per cent.

Buildings with shops and residential apartments in upper stories, and ordinary business houses situated in central positions and constructed of brick and plaster or stone, average from nine-twentieths to eleven-twentieths of 1 per cent.

Wood and corrugated iron buildings, brick lined, centrally located and used as shops or ordinary business houses, are charged at an average of four-fifths of 1 per cent. Wood and corrugated iron, without lining, used as shops or ordinary business houses, are charged at an average of nine-tenths of 1 per cent.

Fire losses in the district of Johannesburg are not considered heavy and allow of a fair margin of profit. There is a considerable demand for private fire protection, and it is the custom when erecting a large or ordinary business house to install sprinklers, in addition to the installation of hose pipes and fire buckets on each floor of the building. Apart from private protection, sprinklers are installed in order to obtain the 40 per cent reduction in insurance rates allowed by fire insurance companies.

The record of fire losses, etc., in the city of Johannesburg for the past ten years—1903 to 1913—has been as follows: Actual

fires, 1,653; risk, $94,555,305; insurance, $70,892,188; damage, $3,309,668.

INSURANCE NEWS IN THE WEST

The Fire Insurance Rate Situation in Illinois.—Insurance Superintendent Potts, of Illinois, is proving himself a Tartar so far as the fire insurance companies are concerned. When he made his report on Illinois rates to the Governor in May, he expressed a desire to commence legal action against the companies at once, but the Governor was more conservative and put his veto on hasty action. It was agreed the companies should be given opportunity to present their reasons why the rate reductions demanded by the Superintendent should not be made. A committee of prominent underwriters was named to represent the companies. August 20 was decided upon as the date when they should present their side. Some members of the committee were on vacation and some live in the East and the date named slipped by without action by the committee. Mr. Potts allowed about a week's grace and then filed suit against 133 companies, practically all the stock corporations that do business in Illinois. The Superintendent charges the companies with combination to prevent competition. The action is one that will almost certainly cause them much annoyance, if it does not prove really dangerous. About twelve years ago the old Belleville compact case was started as an action at common law against the companies that were members of the compact that made and enforced rates for the district in Illinois across from St. Louis, Mo. After long litigation the companies were enjoined from combining to fix rates and to prevent competition. That case rose under the old system of mandatory rates. Later the compact system was done away with and the making of "advisory" rates was taken up by the Illinois Inspection Bureau. Mr. Potts charges that this change was in effect a subterfuge and that through other organizations the companies are accomplishing what they used to accomplish through the various compacts. There are large possibilities for trouble in a suit of this character. There are innumerable things done every month in the course of business which, if brought before a court in just the right way, can be made to look bad for the companies. They constitute a sort of circumstantial evidence. Legally it may fall far short of being sufficient to sustain the charges, but when it is played up in "trust-busting" newspapers it is sufficient to make the public dissatisfied with the rates and give timid agents excuse for introducing demoralizing practices in the business.

* * *

New York Appointment of Fred S. James and Co.—The appointment of E. E. Wakefield as assistant manager of the General and the Urbaine in the office of Fred S. James & Co., of New York, came as a surprise to his friends in Chicago. They had looked rather to his advancement in the Western department of the National of Hartford, with which he has been connected for some years. Mr. Wakefield has been regarded as one of the best of the younger fire insurance men of Chicago. He was connected with the old Insurance Survey Bureau and there received a training as an inspector, which has had considerable to do with his progress since. Entering the service of the National of Hartford, he became a daily report examiner, then he was put in charge of the improved risk department in the Western department, and later he was made superintendent of agents, while still handling improved risks. In addition to his regular work he studied law at one of the colleges where evening classes are held and in 1913 was graduated. He enjoys the confidence both of General Agent Fred S. James and Assistant General Agent George W. Blossom of the National, and they evidently concluded they could use him to greater advantage in their Eastern organization than in the Western.

* * *

Improvement in the Munday-Lorimer Bank Situation.—The surety companies that were obliged to pay out hundreds of thousands under their depository bonds on the Munday-Lorimer banks, which closed in Chicago in June, are now beginning to get their money back. One of the smaller banks of the group has reopened and another has been merged into a neighboring institution. Plans for the reorganization of the La Salle Street Trust and Savings Bank, the largest one of the group, have progressed to the point where November 5 has been named as the date for reopening, with new officers. Two of the smaller banks are still closed and their future has not yet been determined. The question which now interests some of the local representatives of the surety companies is how much will be recovered before the end of this year. Especially those whose companies took on liability through reinsurance dislike having the annual statements show heavy losses in Illinois, as those not familiar with the circumstances are likely to hold such figures as blots on the records of local Chicago managers. If, however, recoveries are made during the coming three or four months, the Illinois loss ratio would go into the records as normal.

* * *

Commissioner Epsteen on Liability Loss Reserves.—S. Epsteen, Insurance Commissioner of Colorado, was in Chicago this week on his way East. He will attend both the commissioners' convention and the casualty and surety meeting at White Sulphur Springs before returning home. He has been making a special study of liability and workmen's compensation loss reserves and he expresses the hope that the commissioners will take decisive action on this question at their meeting. He admits that it is impossible on present available data to work out a scientifically acurate system for computing reserves for losses, but he expresses the belief that the commissioners should assume an arbitrary standard, so long as it is adequate, and let it be used pending the gaining of a more complete experience. He regards insurance of solvency of the companies as the urgent need at this time rather than the working out of a system that at some future date would be more scientific than any that could be put into effect at once.

* * *

Interest in Meeting of National Association of Casualty and Surety Agents.—Especially in the larger cities of the West, much interest is being shown in the coming annual meeting of the National Association of Casualty and Surety Agents. The attendance of men representing important general agencies promises to be large. Cleveland, Detroit, Chicago and other cities will send good delegations, and it is hoped there will be a considerable attendance from smaller places, especially in States not too distant from West Virginia. While there will be section meetings devoted to different branches of the business, it appears very probable that the most interesting features of the meeting will be those in which the future policy of the organization itself will be considered. It appears certain that the officers and members of the executive committee will have to be relieved of considerable of the work they have been performing for the past year and the best plan for effecting such a change will require careful consideration. Other questions likely to receive attention are the extension of the membership, the relation of the association to local associations and boards of casualty and surety men, the work which the organization could profitably undertake for the benefit of its members, and declaration of its

attitude towards certain important questions likely to come before the various legislatures during the coming Winter.

Chicago, September 4, 1914. LA SALLE

ITEMS OF INSURANCE NEWS.

The appointments of John B. Hanna, of Hartford County; Charles D. Wagaman, of Washington County, and James Higgins, of Baltimore City, as the members of the Maryland Workmen's Compensation Board were announced last week by Governor Goldborough at Cambridge.

Insurance Commissioner Hardison, of Massachusetts, has received an order to furnish information in detail regarding the congested district liabilities of fire insurance companies and reinsurance thereon in various large cities throughout the United States.

Insurance Superintendent Potts, of Illinois, has countered on the fire insurance companies for taking into the Federal Court the litigation over annexes, which he intended to prosecute in the State courts. Over forty companies operating annexes in Illinois joined in that action. Eleven companies operating in Illinois did not join in the litigation, however. Superintendent Potts has begun suit in the Circuit Court at Springfield against these eleven companies, charging them with violating the law in maintaining underwriters' annexes.

At a meeting of the New Jersey State Federation of Labor held in Newark a few days ago a resolution was passed requesting the incoming Legislature to pass a measure appointing a salaried commission of three members to disburse compensation. The present New Jersey compensation act was criticised as inadequate, leaving the unlettered workman a victim "of the avarice of unscrupulous private interests."

Following the decision of the New Jersey Department of Banking and Insurance at Trenton given last January that rates of reinsurance policies must conform to the filing, as made in Trenton, it has been further expressed by the department that in case of reinsurances of marine or transportation risks, where the reinsurance policy covers only the fire hazard portion of the risk, such policies must also be written at the rates filed under Chapter 85, Laws of 1913.

That the next session of the Iowa Legislature is going to wrestle with the question of State insurance is not doubted by Des Moines insurance men who are in touch with the situation. In fact, there are evidences that a publicity campaign in favor of State insurance is being fathered by parties who are desirous, so they claim, of "reducing the cost of insurance to the minimum."

The Fall meeting of the Actuarial Society of America will be held October 15 and 16 at Milwaukee, Wis. James C. Coffin, associate actuary of the Northwestern Mutual Life, has extended the invitation on behalf of his company which has been accepted.

The City of Toronto has made an effort to insure in Canadian companies under a group policy the volunteers from that city who take part in the European war, but this was refused on the ground that the law forbids special rates for groups. However, offers were made to issue policies to individuals, with a limit of $1,000, at a minimum cost of $100 each. According to the Mayor, offers have been made by one or two United States companies at a lower rates, but no action has been taken, as preference, it is said, is to be shown Canadian companies.

The official programme for the annual meeting of the National Convention of Insurance Commissioners at Grove Park Inn, Asheville, N. C., September 15-18, is announced as follows:

September 15, 10 A. M.—Addresses of Welcome; President's Address; Call of Committees. 8:30 P. M.—"Compulsory Local Investments." T. H. Henry, Mississippi, and F. H. McMaster, South Carolina; "Should the State Encourage the Formation of New Companies," W. W. Colliver, Texas, and E. H. Deavitt, Vermont.

September 16, 10 A. M.—"Should We Abandon the American Restrictions upon the Classes of Insurance Written: (a) By a Company doing Direct Writing, (b) By a Company doing Reinsurance." Burton Mansfield, Connecticut; Frank Hasbrouck, New York, and C. G. Revelle, Missouri. Executive Session. 8:30 P. M.—"Acquisition Cost of Fire Insurance," Alvin E. Hebert, Louisiana; "Cost of Miscellaneous Insurance," S. Epsteen; "Participating and Non-Participating Insurance by Stock, Fire and Casualty Insurance Companies," R. M. Small, Ohio, and A. L. Welch, Oklahoma.

September 17, 10 A. M.—"Workmen's Compensation Results in Massachusetts, and Suggestions drawn therefrom," F. H. Hardison, Massachusetts; Symposium of Experience in other States, Connecticut, Idaho, Illinois, Michigan, New Jersey, New York, Ohio, Wisconsin. 8:30 P. M.—"Sphere of Activity of an Insurance Department," Robert J. Merrill, New Hampshire; Charles Johnson, Pennsylvania; E. P. Van Valkenberg, Idaho, and John S. Darst, West Virginia. Executive Session.

September 18, 10 A. M.—"Combination Policies." Frank Hasbrouck, New York; W. C. Taylor, North Dakota; "Utilitarianism of Insurance," R. M. Potts, Illinois; "Fire Insurance and the Prevention of Fire Waste," C. F. Nesbit, District of Columbia. Election of Officers. Adjournment.

The latest figures issued by the Michigan Industrial Accident Board show the following classification of compensation insurance in that State: Of the 11,954 employers under the act on July 31, 1914, 10,267 carry stock insurance; 489, besides sixty State departments, are in the State fund; 404 in mutuals, and 468 carry their own risk. Those carrying their own risk are almost exclusively large concerns. The stock companies have nearly all of the automobile concerns. Their list of auto and auto parts establishments totals 372, against 5 for the State fund, 13 for the mutuals and 8 carrying their own risks. Food products manufacturers number 726, out of 869; foundries, 347, out of 400; construction, 2,623, out of 2,993; lumber, 583, out of 749; printing and binding, 333, out of 370.

The Texas Fire Insurance Commission has completed a new fire report and it covers 41,000 fires officially reported since December 10, 1910. As usual, a large majority are classed as preventable. There were 18,878 fires in dwellings, apartment houses, boarding houses and private outhouses. Of that number 13,223 or 70.1 per cent were classed as preventable; 2,076 or 11 per cent as being unpreventable and 3,574 or 18.9 per cent of unknown origin. There were 22,122 fires reported in mercantile, special hazards and other classes. Of that number 12,091 or 54.7 per cent were classed as preventable; 4,110 or 18.6 per cent unpreventable and 5,921 or 26.7 per cent from unknown cause.

Boston fire insurance premiums for the first six months of the year aggregated $2,537,336, as against $2,599,239 for the corresponding period of last year. The returns of the companies, as issued by the Boston Protective Department, are given below, the figures for the first six months of each year from 1905 to 1913, inclusive, being: 1905, $2,050,887; 1906, $2,146,063; 1907, $2,197,373; 1908, $2,272,877; 1909, $2,306,963; 1910, $2,351,372; 1911, $2,431,896; 1912, $2,448,550; 1913, $2,559,239.

Gov. Walsh, of Massachusetts, last week appointed W. J. Montgomery, State actuary on savings bank insurance, and Thomas P. Riley, a deputy in the Attorney General's office, to act with Insurance Commissioner Hardison as a special commission to investigate the practices of insurance companies and their rates in workmen's compensation and other insurance, with a view to determining whether or not any monopoly or combination exists in the insurance business; also whether the rates charged by insurance companies for workmen's compensation and other insurance are reasonable, and to what extent government regulation of insurance rates is desirable. It will be remembered that the above commission was provided for by an act of the last Legislature and the commission is to serve without compensation, although it may incur expenses not exceeding four thousand dollars.

Steps were taken at a joint meeting of the officials of the Pennsylvania Department of Labor and Industry, representatives of casualty companies and of manufacturing enterprises held on August 21, at Harrisburg, to bring about uniformity and simplicity in reports of accidents. For some time past efforts have been made by the Pennsylvania officials to secure a form of report that would conform to the ideas of national officials and with those of other States as well as to impose the least possible burden in manufacturers and be satisfactory to insurance companies.

The Louisville Association of Life Underwriters, while disclaiming hostility towards any company and declaring that its activity is only in the interest of clean business methods, recently made protest to the Kentucky Insurance Department against a form of first premium note being used in Louisville by Kentucky companies and some minor companies of other States operating in the Kentucky field. As a result of this campaign the Inter-Southern Life of Louisville has modified the form of note it was using and the new form has received the approval of the Kentucky Insurance Department and completely satisfies the members of the Louisville Association of Life Underwriters.

The Workmen's Compensation Service Bureau will take up the work of approving and labeling machinery and appliances from a safety standpoint, as the Underwriters' Laboratories does from a fire protection standpoint. The bureau has published a number of standards of safety and will puolish more from time to time. In making rates on the merit plan it appears desirable that the credit to be given should be made as definite as possible and not left to the opinion of the individual inspector. Hence it is necessary that devices be either approved as conforming to the standards and entitled to full credit or unapproved and entitled to less than full credit or none at all.

The insurance world will hear, with deepest regret, the announcement of the death, on August 28, of George W. Hatch, for many years editor of the "Insurance Age." He was born at Plainville, Adams County, Wisconsin, July 2, 1856. He graduated from Ripon College in 1880 and taught for a time as principal of the graded school at Brownsville, Minn. Later he studied engineering and worked as a civil engineer on the Northern Pacific in the Yellowstone Valley. From 1883 to 1888 he was editor of the "Western Fireman" of Chicago and on January 1 in the latter year was made editor of "The Insurance Age," a position which he continued to hold until his death.

The figures for fatal accidents in factories and workshops in England for each of the last five years, commencing with 1909, are as follows: 946, 1,080, 1,182, 1,260, 1,309. The percentage of increase in 1913 as compared with 1909 is 38.4. The year 1909 was a year of exceptionally slack trade, and showed the smallest number of fatal accidents since 1900. Compared with 1907, the highest year before 1909, the increase is only 11 per cent.

REVIEW OF THE FINANCIAL SITUATION

DESPITE the German propaganda here for a conversion of American sentiment to an endorsement of Kaiser Wilhelm's cause, public opinion in the United States clearly remains favorable to the so-called Allies. The chances are that American views of the nature of European conflict, already expressed in the public press by editorials, letters and otherwise and by the tenor of daily conversation, will become more emphatic in their antagonism to the ascendency of Germany's dynastic militarism. Economic influences undoubtedly played their part in bringing on the war abroad, but the economic causes of the war are not of half as much interest to ourselves as the economic consequences of the struggle. Undoubtedly the resentment felt here over the destruction of prosperity by this fearful breach of the world's peace has had much to do with the American resentment manifested towards Germany, and it is altogether likely that this resentment is going to be intensified as the appalling economic scope of the war defines itself.

The sentiments which the war has inspired here have not been sufficiently noted by financial and commercial observers. They are likely to become a factor which may complicate the solution of the problem that is pressing on the country, the problem of preserving our own people as well as possible from the worst adversities which the war threatens to inflict upon them. The time is coming soon when it will be psychological for President Wilson to renew his offer of mediation, and when renewed it can have behind it a backing of aroused public conviction such as was not visible behind it a month ago when the first offer was made. If when that time arrives the occasion is not detected and seized, there is no telling what may happen thereafter for ourselves and the rest of the world. There is always an early stage in a great war when it is not too late to call a halt. If the moment is not recognized or efforts for peace are futile the war is almost certain to be carried along to most protracted lengths and a most destructive conclusion, involving in the process all sorts of developments which it is impossible to conjecture.

Uncertainty as to whether or not the European war can be ended almost as suddenly as it began, or whether it is to proceed to a contest of years, handicaps all efforts started here to cope with the financial and commercial situation which the war has brought about. This uncertainty makes it impossible to tell whether or not purely emergency measures should continue to be adopted in and by the United States or whether plans should be laid for readjustments of a more permanent character. So far as emergency action goes, most of the first necessary steps were taken properly in August, but it begins to look as though projects were now well advanced or in contemplation which deserve to be called into question.

The facilities for issuing emergency currency are being abused. The Government is being committed to enterprises which are apt to have a regrettable outcome. At the same time opposition is being offered to programmes which are more likely to have advantageous results than the contrary. Signs are not lacking that the patriotic harmony and understanding which obtained between financial and business interests and the Government a few weeks ago are threatened by political delusions and prejudices and what is worse, by a spirit of sectionalism. The country has been placed in the path of danger by the aid that the Government has lent to what is nothing but a plan for valorizing the principal staples of the South, cotton, tobacco, and naval stores. The silver purchase bill is a measure of identically the same sort as the amendment to the emergency currency act which enables the owners of cotton, tobacco, tar, turpentine and rosin to hold their commodities indefinitely while getting substantial cash advances on them, although nothing is economically more certain than that one cannot have his cake and eat it, too.

In a financial way the country has begun to make distinctly menacing departures and it will not be in the least surprising if the Government were shortly besieged with demands for currency loans on copper, furs and other commodities, to say nothing of land, the markets for which have been depressed or destroyed by the European war. Congress does not give any clear indications of intelligence, when on the one hand it proposes a necessary war tax bill and on the other seeks to pass a river and harbor bill, two-thirds of which represents nothing but an appropriation of pork designed to facilitate Congressional re-election. There is large room to-day for launching legitimate constructive enterprises of a public nature, but none for the waste of public funds in mere largesse to Congressional constituencies, and it is precisely such a waste that the pending river and harbor bill will make. The institution of a Government bureau of war risk insurance was desirable, to help facilitate such foreign trade as the country may do under the contracting circumstances of war, but there is less to be said in favor of the shipping bills passed or in prospect.

Politics is standing in the way of proper action for the rehabilitation of the American merchant marine after a half century of practical non-existence. The right course to pursue would be so to modify the navigation and inspection laws, regardless of labor union outcry, that American ship owners could enter into the world's carrying trade on a basis of competitive equality with foreign ship owners. Such modifications as have been proposed, chiefly through conferring on the President discretionary authority to proclaim a limited suspension of a few of the burdensome provisions of the present statutes, will not go far toward assuring any extensive transfer of vessels to American registry. Nor is much more to be expected of the bill to authorize the Government to buy steamships for the creation of a Government merchant marine. Apart from the hazards suggested by the officially indicated opposition of Great Britain and France to purchase of ships that may now belong to belligerent countries—and the chance to make such purchases has been an inducement for the passage of the bill—and apart from the contingencies of awkward junctures arising from Government merchant vessels plying waters in the area of war there are other objections. This measure is not the right way to go about getting a merchant marine, and all the shipping plans that have been devised in Washington only promise to leave the country in an uncomfortable plight when the war is over and foreign shipping proceeds to take the world's trade away from our own excessively expensive merchant marine.

Moreover, it is becoming clearer every day that too much emphasis is being laid on the foreign trade opportunity which con-

fronts the country. This opportunity is not great at the present time and can only be realized in the further future after years of patient striving. There is a surplus of available vessels, foreign to be sure, at all American ports ready to carry goods abroad and to bring goods into the country. The truth is there are no foreign markets to amount to anything now and they will require much careful nursing and financial assistance before they do amount to anything. The great American business opportunity is right here in the Western Hemisphere, chiefly on the North American Continent and most of all in our own land. Now is the time for effort to stimulate in every conceivable way the home market in which we have always taken pride, and more than anything else there is needed a financial provision to help domestic and foreign trade to recover.

We have a vast potentiality of resources for those money market purposes which, through the supply of capital and the grant of credit, work out in terms of business volumes and values. It would seem that the first thing for us to do just now is to contrive a mobilization of these resources and as the first requisite to that end the new Federal banking system should be set up and put into operation. Although it is not so good a system as it might be, it is better in many respects than the one we have, and once it is working the country will be far better able to accomplish through it the task now impossible of financing American obligations abroad and affording facilities for foreign markets to do business here. About the most encouraging occurrence in the past fortnight was the initiative taken by the Federal Reserve Board in convoking the conference of bankers in Washington yesterday to consider the financial situation and outlook, thus presumably asserting an intention to exercise a much needed leadership in financial affairs.

Routine matters here and abroad of a financial and business bearing were not at all discouraging in the last few days. The British moratorium has been extended for another month, but all the indications are that the world's central money market, London, is slowly getting into better shape, and British bankers have begun to resume discounting of American bills. Enough foreign exchange was created in the last few weeks to permit debtors here to settle their September 1 maturities abroad. If a method can be found to release some of our gold for export, international money market dealings will be broadened and foreign trade will increase.

London	23⅞	24¼	24	24	24	24

COTTON

September 5, 1914.

INSTEAD of attempting to survey cotton markets which either are not open or (in the case of spot markets) are in complete confusion as to values, we are reprinting in this column this week a market letter written by Mr. Samuel T. Hubbard, of New York, which in our opinion goes deeper into the heart of the distressing cotton situation in the United States than anything that has yet been said or printed in this country. The letter is as follows:

New York, September 3, 1914.

For some fifty years the South has regarded its chief staple, cotton, not as a piece of property, but as cash; now as a result of the War, they find that it has become property in the same sense as lumber or real estate. The fact that it is property does not make it worthless any more than a piece of land which cannot be sold, is worthless, but it seems to us that the sudden shock that it became property instead of cash has created a desire to sell it all at once. When a man has a piece of land he cannot sell, excepting at below what he considers it worth, he does not rush to sell it at any old price; he finds some one to take a mortgage upon it and holds it for better or for worse. Usually, the experience of this country is that he holds it for better. Now, all these years through the operations of the Exchanges that has been the progress of trade, but so covered up in the vast complications of international commerce that few have been able to comprehend or realize it. Therefore, regarding cotton as property anybody can understand how to mortgage it, or in other words how to store it, so as to preserve it from the weather or from theft and fire and then borrow. Therefore the question of borrowing money, or rather not money but credit, becomes a much simpler one than to borrow money on a piece of land, because it is only a question of time when one is sold and a long time before the other is sold.

Every obligation of a merchant is paid in credit, only a very small proportion of actual business outside of daily wants is paid in cash. The Government has shown every banker how he can obtain that relatively small amount of cash without difficulty, and the Government, as does every other thinking man, believes the banker, and if not he, the merchant will hunt all over the country to place loans or mortgages on the piece of property they now have in their hands. To say they cannot do this is to expose their inability to handle an ordinary business proposition. Just as soon as they come to consider cotton as property instead of cash we expect to see them hunting all over the country, in every town, for loans on a perfectly safe piece of property at the moment unsalable, but below the cost of production, and not to be replaced at the ruling price.

Of course, some will say that it is a case of supply and demand; so cotton should sell at any ridiculous price, but we find most of these opinions come from men who have been going to Washington for years, asking Congress to give them protection on their cotton goods and factories, so they would not be compelled to encounter this same law of supply and demand when Europe could manufacture goods cheaper than they could.

We think the situation that confronts us is similar to an earthquake, so that all should work together for the public good. Next year the world, even at peace, will need enormous foodstuffs, which this country must supply at the expense of cotton acreage and production. Then cotton will be needed.

For some three hundred years the currency of the world has been Bills of Exchange, based on goods in the hands of merchants and bankers; raw materials of every character, wool, lumber, indigo, sugar, cotton, tea, coffee, spices, and many others, too numerous to mention in transit or in store. These Bills of Exchange, properly endorsed, bearing the endorsement of merchants and bankers pledging their honor and capital to make them good, have been the currency of the world outside of this provincial United States, who have never understood any system of world-wide currency or how the business of the world was carried on. It would surprise any one to know that from October to June these Bills of Exchange represent the carrying of three to five million bales of cotton, carried without question of price on the pledge of the endorsements, and the Bills of Exchange are just as apt to be in St. Petersburg or Constantinople as in London, Paris or Berlin. Some day the bankers of the United States will wake up and look upon Bills of Exchange or their present crude substitute—"Emergency Currency"—as safer than any issue of bonds, because the security behind one is constantly being consumed and the paper liquidated, while the history of this country is, that bonds on any enterprise or bonds of States or cities are seldom or ever paid and cancelled.

Now, this is written in the hope that it may in some slight way show to the planters of the South that they have a valuable piece of property, not immediately salable, but which can be mortgaged, and that they are foolish to try to sell it all to one buyer, when they usually have three buyers.

The Exchanges will doubtless reopen and draw investment buyers also into the field of competition just as soon as it is shown that the effort to turn the entire crop into cash at once has been checked by a realization of the South that such an effort can only result in an enormous and useless loss to themselves.

HUBBARD BROS. & CO.

THE CONTRACT MARKETS

THE NEW YORK COTTON EXCHANGE.

The following were the high, low and closing bid prices for each delivery, on Friday, July 31, in cents and hundredths of a cent per pound, gross weight:

The MOVEMENT OF THE AMERICAN CROP.

The American crop year has been changed to run from August 1 to July 31, and all comparisons are made up accordingly.

The following tables, derived from the New York Cotton Exchange, show the movement of the American cotton crop for the past week and since September 1, 1913, with comparisons for previous years:

CROP MOVEMENT INTO SIGHT.

Weekly Movement.	1910-11.	1911-12.	1912-13.	1913-14.
Port receipts	133,990	129,533	154,753	33,515
Overland to mills and Canada	944	2,253	2,189	603
So. mill takings, est., exclusive of takings from Southern ports.	30.000	25,873	36,796	8,000
Gain of stocks at interior towns	18,007	23,741	11,726	1,033
Brought into sight for week	182,941	181,400	205,464	43,151
Total Movement—				
Port receipts	470,599	353,490	406,517	67,807
Overland to mills and Canada	10,093	12,020	19,248	4,135
Southern mill takings	87,032	60,873	99,796	8,000
in excess of July 31	25,850	17,864	†22,137	.....

Adjustment of Arbitrage Contracts Open Between the Liverpool and New York Cotton Exchanges.—One of the very great perplexities of the situation brought about in the cotton trade by the European War has been the existence of an arbitrage or semi-arbitrage interest of some quarter of a milion bales between the Liverpool and New York Cotton Exchanges. On both sides there has been an ardent desire to settle, or "undo," this arbitrage account, but great difficulties had to be overcome. The two exchanges have been closed since July 31, but the settling and adjusting of outstanding transactions has been going on none the less. It was necessary for Liverpool to take the lead, inasmuch as only buying in that market could give the opportunity to the arbitrageurs to sell their long contracts there and to buy in their short contracts in New York. Unfortunately, Liverpool firms were carrying some 100,000 bales of long contracts for German and Austrian account, and could get no advices or remittances whatever from their customers. There was nothing to do but to liquidate these Continental contracts at the earliest opportunity, and this has now been practically accomplished with the assistance of the weekly purchases of Lancashire spinners. Next after the Continental contracts, the Liverpool Exchange took up the liquidation of the outstanding arbitrage contracts between that market and the American exchanges. A committee was appointed to come to the United States for conference with representatives of the New York Exchange. This committee arrived in New York on Monday last, and after long discussions of the entire situation with a committee of the New York Exhange, a working basis was arrived at upon which it is hoped that a large part, if not all, of the arbitrage contracts may be liquidated within a few weeks. The programme will be greatly facilitated by the fact that Liverpool cotton merchants, acting in conjunction with the English banks and to some extent the British Government, have undertaken that no cotton shall be imported into Liverpool, except on a cash basis, until the present stock of cotton in that market has been so much reduced as to be no longer a strain either upon the merchants or upon the banks. The upset price to be charged for cotton sold out of the Liverpool stock is based on 5.70d. for Jan.-Feb. contracts, and it is hoped that several hundred thousand bales can be disposed of on this basis. It has now been arranged between the two exchanges that against whatever cotton is sold to spinners in Liverpool Jan.-Feb. contracts at 5.70d. shall be bought in; and that for arbitrage account the sellers of these contracts shall buy December contracts in New York at 150 points difference, i. e. at 9.90 cents. It may become necessary to reduce the selling basis in Liverpool, but it is agreed that the selling price of December contracts in New York shall for the present not be in any case lower than 9 cents. New

York commision houses, meantime, are to deposit with banks or trust companies margins down to 9 cents on short contracts held by them for Liverpool account. This arrangement enables the English banks to finance the stock of actual cotton in Liverpool.

GOVERNMENT REPORT ON CONDITION OF THE COTTON CROP ON AUGUST 31, 1914.

The Crop Reporting Board of the Bureau of Crop Estimates of the United States Department of Agriculture, has issued its monthly report on the condition of the cotton crop, estimating from the reports of the correspondents and agents of the Bureau, that the condition on August 25 was 78.0 per cent of a normal, as compared with 76.4 on July 25, 1914; 68.2 on August 25, 1913; 74.8 on August 25, 1912, and 73.4, the average on August 25 of the past ten years.

Comparisons of conditions, by States, follow:

			August 25		
States.	August 25, 1914.	July 25, 1914.	1913.	1912.	Ten-Year Average.
Virginia	86	89	80	80	81
North Carolina	82	86	78	75	77
South Carolina	77	79	77	73	76
Georgia	81	82	76	70	76
Florida	83	86	81	73	78
Alabama	77	81	72	75	74

[There was some business transacted in the Foreign Exchange Market this week, but quotations were uncertain and with wide variations in prices paid.]

Commerce of Paraguay for 1913.—The foreign commerce of Paraguay for 1913, according to the report of Sr. C. Ruiz, director of customs, was: Imports (six months) 3,665,021.60 pesos gold [peso = 97 cents]; exports 5,630,929.13 pesos gold. In the message of President Schaerer to the National Congress, delivered on April 1, 1914, the total imports for the year are estimated at 7,908,-815.45 pesos gold. On this estimate the total foreign trade amounted to 13,539,744.58 pesos gold. This is an increase over 1912 of 3,953,-421.09 pesos—2,558,215.32 pesos in imports and 1,395,205.77 in exports.

Estimating the gold peso at 97 cents United States currency, the value of the foreign trade of Paraguay in 1913 was: Imports, $7,671,551; exports, $5,462,001; total, $13,133,552. Increase over 1912 of $2,481,469 in imports, $1,353,350 in exports, or a total increase of $3,834,819.

The imports by countries for the years 1909, 1912 and 1913 (six months), were as follows:

	1909.	1912.	1913 (6 Mos.)
Germany	$732,082	$1,503,737	$989,898
United Kingdom	1,244,533	1,301,454	963,418

Totals	$4,992,814	$4,789,065	$4,703,358	$4,108,651	$5,462,001

The total of exports to Argentina and to Uruguay, as given above, represents a very considerable element of transit trade. Nearly all the hides, live animals, quebracho, and some woods, shown in the table below, accredited primarily as exports to the two counties mentioned, are in reality exports to Europe and to the United States.

The exports by articles in 1912 and 1913 (six months) were as follows:

	1912.	1913 (6 Mos.)
Hides	$1,050,166	$580,748
Woods	850,726	491,199
Quebracho extract	.....	424,505
Yerba mate	485,968	410,144
Fresh fruits	1,245,443	387,919
Live animals	47,181	363,983
Tobacco	423,167	195,776
Sand	.....	365
Totals	$4,108,651	$2,854,639

‡In 1909, included jewelry.
†In 1909, included under "Miscellaneous."
‡In 1909, included under "Miscellaneous."
§In 1912 and 1913 included under the several classes of articles to which they respectively belong. The duty free articles in 1912 amounted to $784,839, more than half of which is hardware and the remainder principally material for public works, animals, and drugs. In 1913, the amount was $563,926, against divided as in 1912.

Things and actions are what they are, and the consequences of them will be what they will be; why then should we desire to be deceived?—Bishop Butler's Sermons at the Rolls.

THERE are many points of view from which the European War may be and has been discussed. Here in the United States we are paying our part of the bitter price of it and this fact makes us, like all the rest of the world, near or far, unable to be wholly cool and disinterested in our thinking about it. Still, its comparative remoteness enables us to consider it with a certain philosophy and to make out some of the larger aspects of it, which are obscured for people of the countries actually involved. It is impossible for citizens of these countries to look upon the grievous trials through which they are passing except in the light of the national prepossessions with which they are familiar. Patriotism, or devotion to one's country and to all that is in it or of it is one of the natural instincts of mankind; and hardly less deeply rooted is aversion for all that is not in or of one's country, or that seems to threaten the impairment of that which one has come to regard as distinctive of one's country. In a vast struggle such as is now going on in Europe, the populations of the contesting nations necessarily for the most part misread both their antagonists and themselves. The things they think they are fighting for are not the real things they are fighting for. The Germans and German Austrians, for example, no doubt quite sincerely believe that they and they alone have appreciated the danger of a Slavic conquest of Europe, and of the substitution of the "Unkultur," as they call it,—the incapacity for civilization, or "barbarism," as the ancient Athenians would have called it,—of the Slavs, for the "Kultur," or developed culture, to which they themselves have attained and whose protagonists they believe themselves to be in the modern world. To them, the English and French, through their alliance with Russia, have made themselves representative of darkness instead of light, of ignorance and gross living instead of science and art, of the hordes of Asia rather than of the inheritors of the tradition of trained and refined intelligence that began with the Greeks and finds its modern embodiment in the Germans themselves. Among the French, on the other hand, there is probably no small amount of mere hatred of the Germans because of 1870 and the loss of Alsace and Lorraine. Deeper motives are of no importance to minds so obsessed. The Slavs, for their part, are largely actuated by dull resentment, long silently maturing, against the German assertion of superiority over them in all the things that count. Whether they have been citizens of Russia and of the smaller Slavic States, or dwellers in the extensive Slavic provinces of both the German and the Austrian Empire, they have come to feel bitter animosity because of the German attitude toward them, and the German treatment of them, wherever they were subject to the dominion of Germans. Those who are held up to the world as representatives of "Unkultur" are not apt to feel kindly towards those who so hold them up. These are the prejudices and resentments of the citizens of the Continental countries that are driving at each other's throats. Belgium alone upon the Continent has a more specific grievance and a more tangible reason for engaging in the war. And if we pass to England, we do not think the Germans are altogether wrong in asserting that there has been and is with the average Englishman no small amount of pure jealousy against the Germans by reason of the remarkable advance of the latter in industry and trade. German competition in fields once held to be exclusively England's has certainly given rise to more than a little hostility towards Germany and the Germans on the part of the rank and file of Englishmen.

All this is so; and yet we do not think that the true explanation of the European War is to be found here. Europe is not to-day drenched with blood by reason of these superficial phenomena of the thinking and feeling of the nations that are staking their all upon the arbitrament of arms. Nor, on the other hand, do we attribute the war to the moves of the political chess-players, the men of power who always think that their moves, their combinations, their diplomatic alliances and groupings decide the fate of nations. We do not deny that a titanic contest, long preparing, may be precipitated by the prospective results of a diplomatic engagement or a diplomatic threat, like Germany's undertaking to assist her ally, Austria, in whatever complications might be occasioned by the latter's treatment of Servia. But this particular engagement, with its particular consequences, is certainly not the true cause of the world war that is now being waged. Nations are arrayed against nations, the destinies of whole peoples are put at hazard, the sympathies and passions of the whole of mankind are stirred for no such local and comparatively trivial cause as

this. If anything is clear, it is that the world at large looks upon the present war as decisive of matters that will ultimately affect everybody everywhere.

One of the mistakes of the propagandists of peace and of the settlement of difficulties between nations by means of arbitration, instead of by war, has been that they have held that the dying down of religious fanaticism has removed all genuine excuse or necessity for war. They have perceived that during the period of the Reformation, it would have been impossible to settle the disputes of Catholics and Protestants by any form of arbitration. But they have come to assume that the growth of religious tolerance has done away with this insoluble *question de guerre*, and that no similar question could arise to make resort to war the only means of settlement. They have supposed that among nations generally engaged with industry and trade, dependent upon continuous peace for the prosperity of their populations, the only possible international controversies must be of a non-fundamental kind, due to misapprehensions or to superficial irritations, and that such controversies could all be settled amicably by disinterested international arbitrators. They have wholly overlooked the fact that the convictions and enthusiasms and passions of men may be as completely evoked by conceptions of government, of the organization of society, of political and economic ends and aims, as by religion itself. In the past millions of men have perished by the sword rather than acknowledge the authority of the Catholic Church, and millions more for the purpose of establishing that authority. To-day millions of men would prefer death to the universal imposition of a political, social and economic order which they detest. Rather than have such an order creep upon the world, these millions would stake their lives, their property, and all they hold most dear. Here is a matter which cannot be arbitrated, which goes deeper than calm and impartial discussion, because a finding for the one side means complete destruction for the other; and none will submit to destruction without going to the utmost limit to prevent it.

Since Germany went to war her people have been astounded and dismayed at finding almost a world consensus of opinion and sympathy against her. "*Securus judicat orbis terrarum*, the judgment of the world is sure," said St. Augustine; and it is a dreadful thing for a nation to find that this judgment is averse to it. All the more is it grievous for a nation to find that where a few short years ago it had mankind upon its side, the votes that now drop in the urn are all unfavorable. In 1870, when Germany pricked the bubble of the cheap ambitions of Napoleon III, it was hard to find in the civilized world anything but sympathy and congratulation for the victorious country. All the great debt which the thinking men of all nations have long owed and still owe to the immense achievements of Germany in the realm of science and of the things of the mind and spirit, found instant acknowledgment and expression in the general gladness that deep founded worth had triumphed over vanity and idle desire of applause. And the same was true after the Franco Prussian War, when Germany began to show that the self-discipline which had made her victory certain was being applied to the arts of peace. For long years the economic growth of Germany was not only the wonder but also the delight of the civilized world. Only later did some jealousy show itself in England.

And now all this is woefully changed. The hopes of civilized mankind as a whole are pinned on the defeat of Germany. The fact seems to us indubitable; but it raises the solemn question, why it should be so. We still owe Germany as much as ever we did; we should not be what we are in knowledge and achievement but for what Germany has given us; we still recognize the breadth and the depth of German thinking and doing; and yet we profoundly believe that the welfare of the world hangs upon German defeat in this war. Many of us can give no adequate reasons for feeling thus, any more than our fathers could have given adequate reasons for their sympathy with Germany in 1870. Yet none the less the feeling is as decisive in the one case as in the other. What reasoning, articulate or otherwise, has brought the world to this way of thinking?

It has been eloquently said by English statesmen that their war is not against the Germans, but against German militarism, against the Emperor and his military caste, dominating the Germans and perpetually threatening the peace of other nations, to say nothing of imposing upon all countries an unbearable burden of armament and of preparation for war. That this is part of the reason both for the war itself and for the general attitude towards the war, we would not deny. But we believe it is far from being the entire reason. In our opinion the larger reason for the war is the partly instinctive and partly formulated belief of all the free and fundamentally democratic peoples that the entire German polity, as developed during the past generation, is essentially antagonistic to their own conception of the organization of society; that the very existence of this polity is a continual threat to them; and that all the aggressions of Germany, large or small, are aggressions not against the particular countries concerned, but against the principle of social freedom and social equality upon which the modern state should be based. It is observed that, though Germany has waxed great in industry and commerce, in wealth and the evidences of wealth, during the past quarter of a century, her people have become not more, but less free; that the stratification of society into classes subordinate one to the other has gone farther in Germany than in any other European nation, not even excepting Russia; that the unrestricted authority of the military class, on the one hand, and of the great masters of industry and finance, on the other, has become more confirmed; that the same assertion of divine right which characterizes the rulers of Germany, from the Emperor down to the lowest ranks of his military officialdom and of his chosen directors of affairs, appears plainly in the dealings of the nation itself with the rest of mankind. And the rest of mankind, because essentially democratic, is determined that this polity shall not prevail. It will not endure an increase of power in a country which so conceives society and the organization of the state and the function of the rulers of the state; on the contrary, it will, if it can, diminish the power of such a country, check its velleities to hegemony over its neighbors, and compel it, if possible, to conform itself to the conceptions of social freedom and equality that obtain in the great civilized nations of the world. Such, in our opinion, are the fundamental motives of the nations that are staking their all upon the outcome of the war against Germany; and such is the reasoning, instinctive with most but clearly comprehended by the few, which has left Germany bereft of sympathy in this crisis of her fate.

Arthur Richmond Marsh

COMMERCIAL OPPORTUNITY OF THE UNITED STATES AS CREATED BY THE WAR IN EUROPE

EVERY day that passes brings us nearer to the time when general conclusions as to the financial effects of the European War must give place to close calculations and hard facts. The world's supply and demand for commodities must soon begin to adjust themselves, and the course of trade to be actively resumed along old lines or new. Before considering the possibilities which the present holds, let us consider the status of international trade just previous to the outbreak of war. The world's commerce for 1913, as compiled by the Bureau of Foreign and Domestic Commerce of the Department of Commerce at Washington, reached a value of about $40,000,000,000. The volume of trade of the belligerent nations (excluding Japan) aggregated for the year ended June 30, 1912, not far from $18,500,000. It is interesting further to divide this last amount. It appears that the imports were largely in excess of the exports, the value of the imports of the six nations involved having exceeded $10,000,000,000, while the value of their exports was about $8,500,000,000. It follows that the six countries involved purchase from the world goods exceeding in value by $1,500,000,000 the goods they sell to other countries. Russia is the only one of the six whose exports exceed her imports, as will appear from the following table printed in "The Statist," of London, and covering the calendar year 1912:

(000 Omitted.)

	Imports.	Exports.	Excess of Imports.	Excess of Exports.
United Kingdom	£2,059,741	£487,223	£257,418	.....
France	329,232	268,504	50,728	.....
Russia (excluding Finland)	123,687	160,318	.....	.....
Russia (excsuding Finland)	128,687	160,318	.....	£36,631
Belgium	198,320	158,059	40,261	.....
Total Entente Powers	£1,395,880	£1,174,104	£311,736	£36,631
German Empire	525,661	440,376	85,286	.....
Austria	148,200	113,911	34,289	.....
Total Alliance Powers	£673,861	£551,287	£119,574	.....
Grand total	£2,069,741	£1,728,391	£331,310	£36,631

It apepars from this table that the volume of trade of England, France, Russia and Belgium was about double that of Germany and Austria. It should be noted, too, that the volume of trade for 1913 was considerably greater than for 1912.

The imports and exports of the belligerent countries may further be regarded on the basis of their trade among themselves and their trade with other nations. "The Statist" gives these items as follows (000 omitted):

	Trade with all the Direct Belligerent Countries			Trade with all Other Countries (including Colonies and Possessions of Belligerents		
	Imports. £	Exp'ts. £	Excess. £	Imp'ts. £	Exp'ts. £	Excess. £
United Kingdom	186,724	106,823	*79,901	557,917	380,400	*177,517
(Excluding Germany and Austria)	109,657	61,517	*48,140	.....	.....	.....
France	125,086	127,510	†2,424	204,146	130,994	*73,152
Russia	77,157	101,213	†24,056	46,530	59,105	†13,375
Belgium	96,125	99,361	†3,236	102,195	58,698	*43,497
Total Entente Powers	485,092	434,907	*50,185	910,788	629,197	*281,591
German Empire	208,830	207,100	*1,730	316,871	233,276	*83,595
Austria	85,667	69,669	*15,998	52,533	44,242	*18,291
Total Alliance Powers	294,497	276,769	*17,718	379,404	277,518	*101,886
Grand total	779,589	711,676	*67,903	1,290,192	906,715	*383,477

*Imports. †Exports.

This table shows that England's trade with other than belligerent countries greatly exceeds her trade with the belligerent countries. The trade of Germany with the belligerent nations is much greater than England's, but her trade with the non-belligerent nations is hardly more than half as large as England's. It will also be noted that in 1912 the Entente Powers imported from non-belligerent countries goods of a value of about £281,500,000 in excess of goods sold; while Germany and Austria purchased from nations other than those now at war with them only about £102,000 worth of goods in excess of goods sold.

In a third table, which we print at the end of this article, "The Statist" compiles figures covering the trade of the belligerent nations with individual countries now at peace, including Japan, as the figures were published before Japan declared war against Germany and Austria.

It will be seen that the United States ranks first in volume of trade carried on by outside nations with the nations at war. The figures here given place this trade at about $1,900,000,000, or not quite half of our total volume of trade, which was placed by the Department of Commerce at $4,277,000,000 for the year ended June 30, 1913. The belligerent countries imported from the United States in 1912 goods valued at about $958,000,000 in excess of the value of their exports to the United States. Of this amount England accounted for about $505,000,000 and Germany for about $165,000,000.

Needless to state, a very large part of this great volume of trade is at the present time disorganized. German and Austrian foreign trade is at a standstill. Belgium and Russia are doing very little. This must also be true to a large extent of France, which has placed every able-bodied man under arms. As to the case of England, it is interesting to quote from "The Statist," which must be taken as fairly representative of British financial opinion:

"We have complete control of the sea, our ships can pass backwards and forwards, and it may be that in the immediate future we shall be able to share with the United States a large proportion of the world's trade that in the past has gone to Germany and other Continental countries. But how long will the recent big demand for goods for the rest of the world be maintained? Immediately after the war goods and manufactures may be in demand for the victorious countries who receive huge indemnities, wherewith they are able to replace damage and depreciation caused by the war. But the reduction to poverty of the losing nations, and the waste of wealth and consequent diminution of purchasing power all round, cannot but adversely affect for a long time the prosperity of the whole world."

Let us regard for a moment the possibilities for us involved in this situation. Let us assume that England will be able to maintain to the same extent as before the war her share in the world's commerce. The export trade of the European warring countries, other than England, to non-belligerent countries for the calendar year 1912 reached the value of about $2,558,000,000. Including England the figure is approximately $4,406,000,000. The exports of the six belligerents to Argentina and Brazil totalled $346,450,000, or, excluding England, $185,000,000; to Canada about $139,360,000, or excluding England, $25,000,000; to China, about $101,400,000, or, excluding England, $49,000,000; to Japan, about $90,500,000, or, excluding England, $31,000,000.

In its bearing on the question of British commerce during the war the returns of the London Board of Trade for August are interesting. Imports compared with the corresponding month last year, it is stated, show a decrease of upward of $65,000,000, while exports have fallen off nearly $100,000,000. The imports of sugar have dropped more than $7,500,000, of which a loss of $4,000,000

falls on Germany alone. Manufactured articles show a decrease of $42,500,000 in imports.

"In exports coal is down $10,,000,000 and manufactured articles $75,000,000. Of the latter $12,500,000 was lost on ships and war munitions and $30,000,000 on cotton and woolen fabrics."

A more detailed estimate of the trade with South America and Central America is afforded by the statement issued on September 7 by the Director General of the Pan-American Union. Mr. Barrett procured by cable commercial data from the Latin-American capitals, covering the calendar year 1913, as follows:

Total imports	$1,304,261,763
Total exports	1,565,916,812
Total foreign commerce	$2,870,188,575
Excess of exports	261,655,049

The trade of these countries with the nations now at war is given as follows:

	Imports from	Exports to
United Kingdom	$322,036,347	$316,419,914
France	103,220,223	120,907,415
Belgium	43,747,164	62,557,560
Russia	?	?
German Empire	216,010,418	192,394,702
Austria	9,026,478	23,234,991

The figures for the United States are:

	Imports from	Exports to
United States	$317,323,294	$504,378,212

It will be noted that this country ranked second in the value of the goods imported into South America, and first in the value of the goods exported from South America. The possibilities of trade expansion are shown by the fact that the total value of imports into Latin-America, aside from those of the United States, is $986,938,469.

We shall now consider briefly the volume of our trade which may be cut off by the war. Figures are available covering our exports for the fiscal year ended June 30, 1914. They are as follows:

EXPORTS FROM THE UNITED STATES TO EUROPEAN NATIONS NOW AT WAR, YEAR ENDED JUNE 30, 1914.

United Kingdom	$594,271,863
France	159,818,924
Russia	30,088,643
Belgium	61,219,894
German Empire	344,794,276
Austria	22,718,258
	$1,212,911,858

If all trade with the belligerents were to be cut off, we should thus have goods to the value of $1,212,911,858, or, deducting exports to England, $618,639,995. Could this value of exports be applied to supply in part the gap left by the stoppage of exports valued at $2,558,000,000, which we saw originated in the belligerent countries other than England during 1912? In order to estimate how far this can be done it will be helpful to examine into the nature of these exports. This will appear, as regards the principal articles, from the following table:

This table brings out one of the strongest reasons for believing that, with proper facilities, our goods can command a wide market. The preponderating value of our goods consists of the necessities of life. The market should be as wide as our supply, even with the European trade cut off. It should be borne in mind, further, that while we are here discussing primarily new trade openings, Europe may take a larger amount of our goods than is generally expected. Secretary of Commerce Redfield is quoted as saying: "Europe must have our wheat or starve." It is conceivable that Germany will find means to import, perhaps through neutral Holland or Denmark, a considerable amount of cotton which she will sorely need to supply her soldiers with clothing during the Winter season.

Having considered, now, the statistical situation with regard to the volume of trade of the warring nations, of the nations at peace, and of ourselves, and having set forth briefly the character of the goods we are in a position to offer in the new markets opened up to us by the war, it remains to discuss the factors which are involved in actually taking hold of the opportunities presented. These comprise the financial machinery for establishing our credit in new countries, and the intelligent study of the problem by the individual exporter.

The first of these vital factors in the resumption of our former export business and even more in reaching out into new fields, must be the capital available in those countries for the purchase of our goods. It seems reasonable to assert that when the financial basis is well established the transportation facilities will be promptly supplied. Referring to the economic basis of the matter, the National City Bank, which has taken the lead among our banks as regards the development of more satisfactory financial relations with South America, comments as follows in its monthly bulletin of September, 1914:

"Over and beyond the obvious losses or gains of this trade or that, the economist sees the terrible waste of capital and lasting injuries inflicted upon some of the leading nations of the world. He knows that such losses must necessarily fall upon all nations, directly or indirectly. The investment fund of the world is a common fund; its growth means that mankind will be equipped with more effective means of production and distribution, and that the common supply of necessaries and comforts will steadily increase, while losses from that fund mean that this progress will be retarded. With savings diminished and enormous government loans competing for money, capital will cost more in every market and for every use.

"It is estimated that England has been investing about $1,000,000,000 a year of surplus income in other countries. Most of it has gone into public utilities, such as steam and street railways, water works, lighting plants, general city improvements, etc., but a considerable portion has gone into industries, mines, plantations, etc. France has been second to England in such outside investments and

U. S. EXPORTS FOR FISCAL YEAR ENDING JUNE 30, 1914 (In Part).

Principal Items..	United Kingdom.	France.	Russia in Europe.	Belgium.	Germany.	Austria-Hungary.	Totals.

Germany third. Holland, likewise, has invested freely abroad. It is certain that the Continental countries will need all of their means at home for some time to come, to handle the war loans and to rehabilitate their industries when the war is over. England has a very large income available for investment, but she will be obliged to not only finance her own share of the war, but aid her allies. Even England will be a poor market for outside securities while the war lasts.

"These warring countries have supplied regularly perhaps $1,500,000,000 per annum, of new capital for other countries. Now that they are engaged in this great struggle, where are these funds coming from next year and in the following years? If they are not forthcoming trade will not be very good in Canada, South America and other new countries for anybody."

This line of thought is further emphasized by a statement issued by the National Foreign Trade Council, of which Mr. James A. Farrell, president of the United States Steel Corporation, is chairman. Referring to the question of banking, the statement says that the future of this country's business in South America depends on the improvement of banking facilities. It continues:

"We owe South America far more than South America owes us. The trade balance is heavily adverse to the United States. Since South American interests owe heavily at London, they naturally desire that the United States pay at London for its heavy imports of coffee, rubber, nitrates, etc. Importers, therefore, are obliged to transfer funds to London, a difficult and expensive process at the prevailing rates of interest. Of course this money is not shipped on from London to South America. London discharges the obligations in British manufactures, thus effectively alienating to the United Kingdom the selling power which we should derive from heavy purchases of South American merchandise.

"In healthful trade the United States should more largely discharge its indebtedness to South America by increased exports. Obligations for imports payable in London not only prevent this, but siphon gold from our banks to Europe.

"The most conspicuous example of our disadvantage is seen in the trade with Brazil. During the last fiscal year American imports from Brazil were valued at $101,329,073, but we sold to Brazil in return merchandise valued at only $29,963,914. Vessels have delivered rubber, coffee, and other Brazilian products to the United States and loaded with cotton and grain which they have transported to England, loading in British ports with British manufactured goods which were carried to South America, thus completing the triangle.

"While we are willing and able to pay for South American products our manufacturers and trading houses are reluctant to ship goods to the sister republics, many of whom have declared moratoria. Manufacturers and exporters declare they do not know where their money is coming from. As a matter of fact the exporter's money ought to come from his next door neighbor, the importer of South American merchandise.

"We are certainly at a disadvantage if our indebtedness is used to pay for British manufactures exported to South America while our own manufactures remain congested on our docks for lack of sound credits. The necessity is apparent of machinery to bring together the importer of South American products and the exporter of our manufactures. Toward this goal various banks are seeking to work, but the field is new. The task is complicated by the lack of co-operation between exporters and importers as well as by the absence of established American banks in South American financial centres. The new banking law, fortunately, permits the establishment of foreign branches of national banks, but the authorization of national banks to deal in acceptances of foreign paper is not yet effective. So long as it is not in operation a serious difficulty confronts the establishment here of an international discount market strong enough to support direct exchange with the neutral markets of South America and the Far East."

Of deeper bearing on the immediate future of our foreign trade than the establishment of branch banks is the careful inter-relation of financial interests which has been established by European financiers throughout South America. It is estimated that British investments in those countries amount to $3,376,495,837, yielding about $160,000,000 in annual interest. Trade follows investment in national course. But European investors have not rested here, continues the Trade Council statement: "In recent years they have systematically fortified their South American trade by stipulating that materials from the country providing the funds be preferred in the resultant construction and equipment contracts. The practice closed many commercial doors to the United States. Will they remain closed? This depends upon whether European capital continues almost exclusively to supply the funds for continuance of these projects. Should the burdens of war decrease Europe's investing ability, or even regardless of that contingency, the investors of the United States may well conclude that judicious investment in South American railways, industries, plantations and mines not only offers adequate profits but will open and protect new markets for manufactures and certain natural products such as oil, coal and lumber. While the American public is not educated to foreign investment and the country is still a borrower in the world's financial market, it should be remembered that the new tariff has precipitated many American industries into world competition. Our domestic prosperity, the welfare of millions of workers, increasingly depends upon the success of export trade. With our commercial operations thus forced to encircle the globe, capital will scarcely remain cloistered within our own borders."

To this same purpose is an assertion recently attributed to Mr. Charles M. Pepper, former foreign trade adviser to the Department of State, to the effect that future trade relations of the United States with South America depend in large degree on whether or not this country can loan South America $100,000,000 during the next twelve months, and $500,000,000 during the next five years.

There can be no doubt, then, that the statistics of trade show opportunities for American exporters arising out of the European War. But it must also be admitted that several elements tend to diminish the immediate possibility of realizing to the full upon these opportunities. It is reasonable to suppose, however, that the earnest and intelligent effort being directed toward solving the difficulties in the way of adequate credit and transportation facilities will be ultimately successful. What remains is for the American exporter to realize that a very large part of the responsibility for meeting this new situation rests upon him. He must not rely upon the new credit agencies to sell his goods for him, nor must he sit back calmly in the belief that the entire carefully built structure of European trade will collapse all at once. In order to divert trade into the new chanenls he desires it to flow through he must devote to the problem the careful study which its extreme newness and difficulty would dictate. He should consider the advisability of sending representatives directly into the new fields—men who will not go to South America, for example, to tell the natives through an interpreter, how to run their country, but able, Spanish-speaking business men, who will learn what the people want and exactly how they want it. At any rate, the present problem, which is, in its potentialities, one of the greatest ever presented to the financiers and business men of the United States, must be most care-

fully considered. Trade built up in any but the most sound economic manner will inevitably yield after the war to the proved skill and adaptability of the European bankers and merchants.

THE MAXIMUM SAVING IN THE COST OF CAPITAL THROUGH GOVERNMENT OWNERSHIP OF RAILWAYS IN THE UNITED STATES

THE question of the economic saving or loss to the United States through having the Government take over from their present private owners the railways of the country must be divided at the start into the two distinct questions (1) of the saving or loss that would result in respect of the cost of the capital invested in the railways, and (2) of the saving or loss that would come about through the comparative efficiency of Government, as compared with private operation of the roads. With regard to the latter of these questions nearly all must be a matter of pure conjecture, inasmuch as we have no strictly comparable statistics, unless perhaps for France. It is the admittedly general experience of mankind that what is done by government is less efficiently and more expensively done, than what is done by private initiative and direction; and such figures about the operation of railways as are even remotely comparable decidedly point in this direction. But we have no cases of two or more railroads serving substantially the same territory, subject to substantially the same expense for materials, performing substantially the same service, etc., the one of which is governmentally owned and operated and the other or the remainder are private owned and operated. Conclusions on the comparative economy of the one or the other system cannot therefore be arrived at with mathematical accuracy, but, to be of value, must be the result of extended inquiries by experienced persons, who are able to give due weight to all the infinite details of the problem, giving to each element its just weight.

The question of the saving or loss in the cost of capital, however, is a decidedly simpler one, in that details and conflicting conditions may be virtually eliminated, and experienced judgment be brought to bear upon the matter in its mass. About a month ago the "Saturday Evening Post," of Philadelphia, published an exchange of letters between Mr. E. P. Ripley, President of the Atchison, Topeka and Santa Fe Railway, and the distinguished English student of economic and financial matters, Sir George Paish, former editor of the "Statist," recently appointed by the Chancellor of the Exchequer to assist the Treasury in dealing with economic and financial questions arising out of the present war. These letters have just been republished by the "Railway Age Gazette," of New York, together with an editorial upon them. As indicated above, the theme of the letters and of the editorial is the maximum possible saving in annual cost of capital, supposing Government ownership of railways to become an accomplished fact in the United States. The judgments given are all of very great interest, in view of the rising clamor for Government ownership among a certain class of our politicians. In one important respect, however, the figures used cannot now be regarded as adequate, i. e. the assumption as to the rate of interest at which the United States Government can float its bonds, or make it attractive for existing holders of railroad securities to exchange them for the Government bonds. For several years past, as everybody knows, the market rate of interest on invested capital has been tending to higher and higher levels,

largely because of the immense borrowings of governments and their political subdivisions. The great European War now raging, with its vast destruction of capital and the certainty that hitherto unheard-of sums must be raised at any cost, as soon as the war is over, by virtually all the nations of Europe, makes it an impossibility that for a generation at least the United States should be able to float a mass of bonds, amounting all told to thousands of millions of dollars, at any such rate as 3½ per cent or even 4 per cent. Were the Government of the United States to undertake the acquisition of our railways within any reasonable time in the future, we can hardly believe that less than 4½ per cent, and possibly even, 5 per cent would be the annual cost of the money. With this important reservation, then, the letters of Mr. Ripley and Sir George Paish and the editorial of the "Railway Age Gazette" (in part) are here reprinted

* * *

LETTER OF MR. E. P. RIPLEY

Chicago, June 6, 1914.

Editor The Saturday Evening Post:

Dear Sir:—One of the principal arguments of ex-Governor Stubbs and others who have advocated in this country the Government ownership of railroads has been that vast savings could be effected by the use of Government credit. Mr. Clifford Thorne goes so far as to estimate the saving at $400,000,000, on the assumption that Government could finance the properties on a 3 per cent basis; but ex-Governor Stubbs figures it at four.

Being very much in doubt as to these estimates and wishing for expert opinion I wrote to Sir George Paish, editor of the London "Statist," and well known all over the world as an authority on financial matters. I inclose his reply, from which it appears that there might be a possible economy of sixty millions, and a later and ultimate saving of seventy millions, or one hundred and thirty millions in all, arising from the ability of Government to raise money on better terms than can the railroads under present conditions.

But when this possible saving is put over against the inevitable extravagance and waste and loss of every Government enterprise, it would melt so rapidly as to leave hardly a trace. Yours truly,

E. P. RIPLEY,

President The Atchison, Topeka and Santa Fe Railway System.

LETTER OF SIR GEORGE PAISH.

June 23, 1914.

Dear Mr. Ripley:—I have been very much interested in your letter of the sixth of June. According to the return of the Interstate Commerce Commission for the year ended June 30, 1911, the funded debt of the railways of the United States was $9,816,-079,405 and the interest accrued on the funded debt for the year was $410,326,852. Thus the average rate of interest paid by American railways on their funded debt was only 4.18 per cent. Were the railways to be purchased by the Government the money could not be raised on better terms than this. Indeed, if the Government were to purchase the railways they would, in my judgment, leave these underlying bonds untouched. To issue nearly $10,000,000,000 of Government bonds to investors would be an impractical operation unless the bonds were taken in exchange for existing bonds. To induce the existing holders to exchange their present bonds for Government bonds the latter would have to be offered at an attractive price. In purchasing the railways there would, of course, be no necessity for the Government to take over the existing bonds, and I imagine that no attempt would be made to do so. Hence, there would be no saving of interest from Government purchase as regards the funded debt, although later on it might or it might not be feasible to refund the existing debt into 3½ per cents as the bonds fell due for payment.

If refunding were possible the saving would ultimately be about $70,000,000 per annum.

The amount of the capital stock of the railways at the end of June, 1911, was $8,364,419,520, and the dividend distributed upon this stock from current income was $302,037,778, or an average return of 3.61 per cent. From surplus, dividends amounting to $158,-157,598 were distributed. The total sum distributed from income and from surplus was $460,195,376, or an average return upon the share capital of 5.5 per cent. Here again it would be quite impossible for the American or any other government to sell bonds to investors sufficient to provide cash to buy this vast quantity of railway stock from the existing holders. Ability to carry the transaction through would be governed by the price at which the Government would offer bonds in exchange for stock. If the price were attractive, stockholders would take payment in bonds; but if it were not tempting the Government bonds would not be taken in payment, and the transaction could not be carried through. Possibly by offering to sell a 4 per cent United States Government bond at par, and to take in exchange railway stocks on a 5 per cent basis (par for a 5 per cent stock), would be sufficient inducement. One must not forget, however, that many stocks are receiving no dividends whatever, and that substantial prices would have to be paid for these non-dividend-paying stocks. When allowance is made for these various factors it would probably be found that the advantage in the matter of interest from Government ownership would be much less than 1 per cent upon the total amount of common stock outstanding.

In brief, there would be no immediate profit from Government ownership as regards the bonded debt of the railways, and as to the stock of the railways the advantage would be probably not more than about $60,000,000 a year.

As to the undivided profits, the public gets the advantage of these anyway. When the surplus profits are put into the roads (as they are at present) the capital account is kept down, and it is not necessary to charge as high freight rates and passenger fares as otherwise would be necessary to pay interest and dividends. I imagine that under Government ownership the policy of applying surplus profits to betterments would be much the same as the policy pursued by the companies hitherto.

Thus one cannot safely calculate a greater immediate profit from Government ownership than about $60,000,000 per annum—excluding, of course, subsequent economies, or subsequent greater cost of operation under Government than under company ownership, and excluding a possible ultimate economy of $70,000,000 per annum from the conversion of the funded debt upon the maturity of the existing bonds. Yours very truly,

GEORGE PAISH.

EDITORIAL OF THE "RAILWAY AGE GAZETTE."

One of the most notorious estimates of the saving which under Government ownership could be made in the cost of railway capital was that presented by Mr. Clifford Thorne, State Railroad Commissioner of Iowa, to different organizations and persons, and which varied from $411,000,000 to $464,000,000, according to the size of the mistakes which Mr. Thorne made in his figures. In an address last February, Mr. C. A. Prouty, director of valuation of the Interstate Commerce Commission, roughly estimated that the railways would cost the Government $20,000,000,000; that the interest rate that would have to be paid on this debt would be 3 per cent; that, therefore, the total interest of the Government would be $600,000,000 per annum, which would be some $72,000,000 less

than the interest and dividends paid by the railways. In his recent book on "Government Ownership of Railways," Mr. Samuel O. Dunn, after making estimates of the total amount that the Government would have to pay for the railways, and the rate of interest it would have to pay on the railway debt, concluded that the Government's maximum possible saving in cost of capital would be $120,000,000 a year. He believed, however, that the saving was likely to be substantially less than this, if, indeed, there were any at all.

Arriving at his conclusion by a different method, Sir George Paish places the maximum possible saving at $130,000,000 a year. Of this, $70,000,000 would be saved by refunding the funded debt of the railways in 3½ per cent Government bonds, provided this refunding were possible. Sir George doubts, however, whether it would be possible for years, simply because he doubts if those who hold the bonds would be willing to exchange them for Government 3½ per cent bonds.

"Thus," he concludes, "one cannot safely calculate a greater immediate profit from Government ownership than about $60,000,000 per annum"; and, of course, if there were any considerable increase in operating expenses under Government ownership this saving would speedily be more than wiped out. As a matter of fact, the greatest possible savings that could be made under Government ownership in the cost of railway capital are so much smaller than the smallest increases that it can be naturally assumed would occur in the cost of operation, that it may be regarded as certain that the adoption of Government ownership, instead of yielding profits to the Government, would speedily involve it in heavy losses.

INDUSTRY, COMMERCE AND FINANCE

Money Circulation in the United States on September 1, 1914.—The Treasury Department's monthly statement of the money in circulation and of the total stock of money in the United States, shows that on September 1 the total amount of money in circulation was $3,478,603,792, as compared with $3,367,368,930 on August 1,—an increase of $111,238,862 for the month. This increase was practically all due to the amounts of Aldrich-Vreeland Emergency Currency, issued to the public by the National banks as bank notes. The general stock of money in the United States on September 1 was $3,819,916,263, as compared with $3,735,579,397 on August 1,—an increase of $84,336,866. During the month of August there was a decrease of $42,677,982 in the country's stock of gold and an increase of $126,633,261 in the amount of bank notes (including emergency currency.) A point of interest is that, despite the heavy gold exports of the current year ($83,508,822 more than the imports up to August 1), the amount of gold in circulation on September 1, 1914, was $21,537,481 more than on the same date in 1913. The *per capita* circulation of money in the United States on September 1, 1914, was $35.03, as compared with $33.96 on August 1, 1914; $34.48 on September 1, 1913; and $34.36 on September 1, 1912.

The following tables show the amounts of the various kinds of money in circulation and the general stock of the same on September 1, 1914, with comparisons for previous months and years:

MONEY IN CIRCULATION.

	Aug. 1, 1914.	Sept. 1, 1914.	Sept. 2, 1913.	Jan. 1, 1879.

Comparative Prices of Live Stock in the United States.—According to the weekly news letter of the Department of Agriculture, the prices paid to producers of meat animals in the United States advanced 3 per cent during the month from July 15 to August 15, 1914. This compares with an average advance from July 15 to August 15 in the past four years of 0.8 per cent. On August 15 last, the price to producers of the United States for meat animals—beef cattle, calves, hogs, sheep, lambs, and chickens—average $7.63, which compares with $7.20, the average on August 15 a year ago, $6.56 two years ago, $5.87 three years ago, and $6.67 four years ago.

The averages for the United States of prices paid to producers of live stock on dates indicated were as follows:

	August 15				July 15,
Item.	1914.	1913.	1912.	1911	1914.
Hogs ....100 pounds	$8.11	$7.79	$7.11	$6.54	$7.72
Beef cattle ....100 pounds	6.47	5.91	5.37	4.39	6.38
Veal calves ....100 pounds	8.08	7.53	6.62	5.93	7.80
Sheep ....100 pounds	4.87	4.32	4.26	3.98	4.75
Lambs ....100 pounds	6.23	5.50	5.60	5.25	6.55
Chickens ....100 pounds	13.10	12.80	....	....	13.40
Wool ....100 pounds	18.70	15.80	18.80	16.00	18.50
Horses ....each	135.20	140.70	142.00	140.80	137.00
Milch cows ....each	60.70	54.80	46.10	42.30	59.70

It will be observed that during the past four years there has been a steady advance in price of each class of meat animals and of milch cows. Horses, on the other hand, have been declining moderately in prices.

* * *

The Foreign Commerce of the Argentine Republic in 1913.—According to the official report of the Argentine statistical office, the total foreign trade of the Argentine Republic for the year 1913 was 904,857,089 pesos ($877,711,376 United States gold), represented by imports to the value of 421,352,542 pesos ($408,711,966), exports of 483,504,547 pesos ($468,999,410). The figures for the preceding year were: Imports, 384,853,469 ($373,307,865); exports, 480,391,256 ($465,979,518); total, 865,244,725 pesos ($839,287,383). There was, therefore, an increase in imports of 36,499,073 pesos ($35,404,101), and in exports of 3,113,291 pesos ($3,019,892), or a total increase in foreign trade of 39,612,364 pesos ($38,423,993).

These figures do not include coin imports and exports, of which the former amounted to 47,941,425 pesos ($46,503,182), and the latter to 43,417,484 pesos ($42,114,959), an increase in the year in coin imports of 11,863,618 pesos ($11,507,709), and in coin exports of 42,831,863 pesos ($41,546,907).

The Argentine gold peso approximates in value the United States dollar, being worth commercially about 97 cents gold. In

the table below and in other tables in this review of Argentine trade, for ordinary comparisons the peso may be treated as equivalent to the United States dollar.

ARGENTINE FOREIGN TRADE FROM 1894 TO 1913.

Year.	Imports. Pesos.	Exports. Pesos.	Year.	Imports. Pesos.	Exports. Pesos.
1894	92,788,625	101,687,986	1904	187,305,969	264,157,525

Netherlands	2,211,110	3,441,667	4,074,104
Uruguay	2,436,611	2,436,913	3,196,403
Sweden	850,132	2,290,645	3,123,883
Switzerland	2,568,763	2,183,400	2,749,682
Paraguay	1,660,174	2,127,506	2,271,135
Norway	905,483	1,468,794	2,261,342
Canada	1,891,530	2,266,257	1,651,810
Mexico	7,949	13,720	1,353,785
Cuba	648,491	1,105,380	1,126,658
Australia	261,576	544,394	1,023,188
Japan	304,270	774,885	868,240
Chile	452,681	571,412	707,998
Portugal	298,971	503,082	585,975
China	589,833	503,847	562,645
Russia	739,915	262,859	447,845
Bolivia	154,799	430,750	252,024
Denmark	50,392	167,930	204,106
Turkey	61,090	103,501	127,026
Dutch possessions	781,709	31,140	15,899
Peru	511,440	2,360	1,342
Other countries	738,414	303,571	351,519
Totals	302,756,095	384,853,469	421,352,542

*It must be remembered that the figures in this and all other tables in this review represent valuations according to Argentine customs appraisements. According to the United States customs house appraisements, the exports of the United States to Argentina (imports above) amount to $54,980,415. The figures above, valuing the peso at 97 cents, would show Argentine imports from the United States as $59,861,703. The difference due mainly to the different standards of appraisement and also to transshipments would therefore be $4,881,288. What is said of the statistics of the United States is also true for all the other countries given in the table above.

†Does not include Australia and Canada.

The percentage that the imports from the eight leading countries bear to the total Argentine imports for the last five years are shown in the following table:

Countries.	1909. Per Cent.	1910. Per Cent.	1911. Per Cent.	1912. Per Cent.	1913. Per Cent.
United Kingdom	32.8	31.1	29.6	30.8	31.1
Germany	14.7	17.4	18.0	16.6	16.9
United States	14.2	13.8	14.3	15.4	14.7
France	10.2	9.6	10.4	9.8	9.0
Italy	8.9	9.0	8.0	8.5	8.3
Belgium	4.5	5.6	5.3	5.3	5.2
Spain	3.1	3.1	3.1	3.1	2.9
Brazil	2.7	2.6	2.3	2.5	2.2

Of the total Argentine imports in 1913, 293,731,546 pesos were dutiable and 127,620,996 pesos duty free.

Exports.—The exports from Argentine, by principal countries of destination were, in 1909, 1912 and 1913, as follows:

	1909. Pesos.	1912. Pesos.	1913. Pesos.
United Kingdom	80,745,066	121,373,358	120,367,811
Germany	41,353,332	53,995,175	57,915,843
France	38,936,004	36,052,009	37,718,537
Belgium	41,306,799	37,258,225	32,731,869
Brazil	16,628,413	22,646,362	24,309,114
United States*	26,066,790	32,391,148	22,894,809
Netherlands	6,052,385	16,027,223	22,623,773
Italy	12,635,710	21,147,962	20,038,893
Uruguay	1,363,901	4,714,480	6,300,568
Spain	3,200,259	3,582,495	4,818,289
Austria-Hungary	1,254,599	2,896,798	3,245,869
Chile	2,671,567	2,456,280	1,944,477
Paraguay	150,478	1,219,925	1,903,804
Bolivia	438,773	930,384	1,131,594
Norway	421,081	1,804,741	1,078,113
Sweden	770,738	1,496,050	1,073,976
Denmark	1,511,550	861,587	732,801
British possessions†	1,274	568,994	696,901
Cuba	543,958	782,741	638,230
Russia	241,985	376,643	607,951
Portugal	266,032	567,019	535,973
French possessions	2,612	74,106	306,972
South Africa	111,972	147,128	163,362
On orders	117,837,922	114,903,510	117,716,237
Other countries	2,717,328	2,116,813	2,008,781
Totals	397,350,528	480,391,256	483,504,547
In United States gold	$385,430,012	$465,979,518	$468,999,410

*These valuations are according to Argentine customs appraisements. According to the United States custom house appraisements the imports of the United States from Argentina (exports above) amount to $25,575,667. The figures above, valuing the peso at 97 cents, would show Argentine exports to the United States as $22,093,491. The difference, due to the different standards of appraisement, would therefore be $3,482,176. What is said of the statistics of the United States is also true for all the other countries given in the table above.

†Does not include Australia, Canada and South Africa.

The exports above classified by countries include only such exports as are shipped to a definite destination. The shipments "on orders," which, as is seen from the above table, comprehend in 1913 over 24 per cent, are shipments subject to cable or mail orders as to final destination. Nearly all of these "on order" shipments ultimately reach the Western European countries and in about the same proportion as the direct shipments to these countries, as given in the table above. It will be seen, therefore, that such countries as the United States, Brazil and Chile occupy a rank above that to which they are in reality entitled if these "on order" shipments could be apportioned to final destination. However, in 1913, there were small "on order" shipments of beef to the United States.

The percentages that the exports to the eight leading countries and "on orders" bear to the total Argentine exports are shown in the following table:

Countries.	1909. Per Cent.	1910. Per Cent.	1911. Per Cent.	1912. Per Cent.	1913. Per Cent.
United Kingdom	20.3	21.7	28.3	25.3	24.9
Germany	10.4	12.1	13.3	11.3	12.0
France	9.8	10.1	12.2	7.5	7.8
Belgium	10.4	8.2	11.0	7.8	6.8
Brazil	4.2	4.7	5.5	4.7	5.0
United States	6.6	6.8	7.5	6.7	4.7
Netherlands	1.5	1.2	2.0	3.3	4.7
Italy	3.2	2.8	4.2	4.4	4.1
On orders	29.7	27.8	11.2	23.9	24.4

* * *

Production of Iron and Steel Merchant Bars in 1913.—The production of iron and steel merchant bars in 1913, according to the American Iron and Steel Institute, amount to 3,957,600 tons, against 3,697,114 tons in 1912, an increase of more than 7 per cent. Of the total in 1913 about 1,026,632 tons were iron and 2,930,977 tons were steel. Pennsylvania made 48.7 per cent of the total in 1913, against 50.8 per cent in 1912.

INSURANCE

Articles on the Theory, Practice and Experience of Insurance.
Notes on Insurance, American and Foreign.
Items of Insurance News.

IT would, at first sight, appear inevitable that all the departments of insurance which have been conducting their business in any or all of the countries in Europe which are belligerents in this most destructive, murderous and awful of all the wars known to history, must have been thrown into such complete confusion, have already suffered such dreadful losses and have been brought face to face with such incalculable risks for the future, that abandonment of the field, for the present at least, would be the only possible remedy. Yet such is not the case. As the European mails begin to reach this country a little more regularly, we find that all our old friends among the chronicles of insurance are reaching us, whether from Germany and Austria, or from the countries of the Triple Entente. We find, further, that not one of these journals indicates any cessation of the writing of insurance of every kind, even life insurance, most affected of all the insurances by the war, going on in almost its customary manner. In fact, Continental life insurance is actually continuing its beneficent work with so little sign of trepidation that it is doing its best to provide indemnity for the very lives exposed to shot and shell. Calm science, applied with courage and determination, is doing its utmost to alleviate the horrors of war.

During the past week, this paper has received from Germany the August 13th issue of the excellent German insurance journal, "Annalen des gesamten Versicherungswesens." It is the first to come through since the outbreak of the war; and in it are found two paragraphs indicating what is being done in Germany with regard to the sudden great addition to the risk of mortality in a population, all of whose males from early manhood to middle age have been summoned to bear arms. A translation of these paragraphs may well interest life insurance men in the United States. They run as follows:

Life Insurance and the War Risk.—The world war that has so unexpectedly broken out has led many of those under the obligation of military service who have already been called to the colors, and also of those who may expect hereafter to be called, to take out life insurance policies, with the inclusion of protection against the war risk, partly entirely new policies and partly, in cases where life insurance policies were already being carired, in the shape of a war risk clause added to these already existing policies. For this inclusion of the war risk it is only natural that corresponding additional premuims should be asked. The rates, however, at which the various companies undertake this coverage of the war risk vary very sharply. One South German Mutual life insurance company holds itself out as furnishing life insurance with inclusion of the war risk, without any extra premium at all. Other companies appear to provide such insurance preferably with an extra premium proportionate to the size of the policy; others increase this extra premium in the way of requiring old policies, long outstanding, to pay not only the extra premium, but also the interest on this extra premium from the time when the policy of life insurance was originally issued. Another South German institution undertakes war life insurances at the flat premium rates of 10 per cent for officers, 8 per cent for members of the reserve and the second reserve and 4 per cent for members of the Landsturm and the medical service. The variation of the conditions under which the various companies will undertake the war risk is, accordingly, very marked. It would perhaps have been better, if the Association of Life Insurance Companies could have decided upon a uniform method of procedure.

War Mortality.—The statistics of war mortality are very fragmentary; and, as we find it stated in a recent number of the "Austrian Insurance Times (Oesterreichische Versicherungs-Zeitung)", those statistics we possess are almost entirely confined to the losses of the victorious and not of the conquered armies. In addition to this primary fact, there must be taken into account the peculiar circumstances of each war, which are so various that really comparable statistics are scarcely afforded by them. The earliest compilations with regard to war mortality had to do with the Crimean War (1854-1856), and chiefly only for the English and the French Armies. The French army had in the Crimean an effective strength of 309,268 men, and losses in killed and in deaths from sickness no less than 30.9 per cent of its total numbers. The losses from the English Army, consisting of 97,864 men amounted to 22.7 per cent of the entire force. In the Prussian-Danish war of 1864 the losses of the Prussian Army, with 63,500 men in the field, were only 1.6 per cent of the effective strength of the army. In the war of Prussia against Austria in 1866 the Prussian losses were only 2.7 per cent of the effective strength of the army. In the Franco-Prussian war 1,451,952 men were mobilized in Germany; and of these 1,113,254 men crossed the French frontier. On battle-fields and through sickness 41,210 men died, being 3.7 per cent of the army that crossed the frontier. As regards the Russo-Turkish war again we have available only the loss figures of the victorious (Russian) army, which reached 16.3 per cent of the total number of Russian troops engaged. It is not until we come to the Japanese-Russan war that we find ourselves in possession of statistical information from both belligerents. The armies engaged in this war stood about 1,200,000 Japanese against 1,650,000 Russians. The Russians lost of their army on battle-fields about 34,000 men; while the Japanese lost 58,900 men. The Russians lost 9,300 men through disease, and the Japanese 37,200 men. The total loss of the Russians accordingly amounted to 3.2 per cent of their effective strength; that of the Japanese to 7.2 per cent. According to the detailed material of Dr. Dumas ("L'Assurance du risque de guerre," Berne, 1911), it is a phenomenon found universally in wars that the relative number of the officers falling on the field of battle is greater than that of the common soldiers taken by themselves; while the latter have suffered much more from sickness than have the officers. Thus, in the Crimean War there fell on the battle-field 4 per cent of the officers, compared with 2.8 per cent of the rank and file. In the Prussian-Austrian war of 1866 the proportions of those who fell were 2.9 per cent of the officers and 1.5 per cent of the rank and file.

It is a further fact, though one but little realized, that the mortality of the civil population of countries at war undergoes a very considerable increase. Thus, at the time of the war between Prussia and Denmark in 1863, we find the Danish mortality (for the civil population) running as follows: 18.3 per 1,000 in the year 1863; 23.3 per 1,000 in 1864 and 23.2 per 1,000 in 1865. Coming next to the effect of the Franco-Prussian war upon the mortality of the civil population in Germany, it appears that in 1869 this had been 28.5 per 1,000, but in 1870 it was 29 per 1,000; in 1871, it was 31 per 1,000; and even as late as 1872 it was still 30 per 1,000. On the side of France, the general (not military) mortality was 23.5 per 1,000 in 1869; 28.4 per 1,000 in 1870; 35.1 per 1,000 in 1871; but in 1872 it had fallen to 22 per 1,000. In general, it may be said that in the past it has been primarily the sickness and plagues accompanying war that have made it so frightful in its destruction of human life. It is, however, precisely upon this side that improvement is to be expected in the future.

THE RESPONSIBILITY OF A LIFE ASSURANCE COMPANY FOR THE ACTS OF ITS AGENTS

By Robert Thodey, F. I. A.*

IN its broadest sense, the word "agent" covers all persons connected with an assurance company, whether as administrators or employes. It includes the directors, officers, clerks, outdoor staff (whether on salary or remunerated by commission), and, in certain circumstances, the company's bankers and solicitors would also be considered as agents. With the exception of the outdoor staff, however, all the "agents" named are constantly within the control of those responsible for the management of the company, while any act performed by them is, generally, clearly governed by well-understood rules laid down for ready guidance in nearly every case. The members of the outdoor staff, however, are not under such continuous supervision, and, moreover, they are engaged in duties which, at some points, do not permit of the enforcement of the stringent rules which control the activities of the indoor staff—I refer more particularly to the acquisition of new business. This paper, therefore, will be confined to a discussion of the responsibility of a life assurance company for the acts of agents engaged either as canvassers for new business or as collectors, or in both capacities,—gentlemen who, in common parlance, are styled life assurance agents.

Canvassing agents, as we know them best, are employed by the various companies to solicit proposals for new assurances. Speaking generally, the work of such an agent ceases with the obtaining of the proposal. For the rest, he necessarily does what he can to facilitate the work of the office he represents in securing completion of the business, and, although it is to his pecuniary advantage to secure completion, he has but little to do with the actual work after lodging the proposal, with, in some cases, a provisional collection on account of the first premium. Again, in the country districts agents are sometimes employed whose duties include the collection of renewal premiums, but who usually have but a limited authority to act on behalf of their company. When we come to the industrial agent, however, we have a man whose duties are more extensive. He is expected to obtain proposals for new assurances and revivals of lapsed policies, also to collect regularly on existing business, while many other matters which ordinarily would be attended to wholly within the office itself, are, at least in their earlier stages, in his hands. The proposal form he uses is a more elaborate document than that put in the hands of his ordinary department confrere. It contains many questions relating to the present and past personal history of the proponent, and also his family history, while it usually ends with a formal declaration warranting the truth of the statements set down, and making the proposal and declaration the basis of the contract. The proposal form for an ordinary department policy is a relatively simpler document, although where such assurances for smaller sums are granted without medical examination, the agent is often entrusted with obtaining the completion of a statement of the proponent's personal and family history.

So long as the agent acts honestly within the scope of his authority all should be plain sailing. The company clothing him with that authority is alone to blame if anything goes wrong, and if some unanticipated effect presents itself, since it is naturally to be presumed that those responsible for the management of the company knew what they were doing when the agent's instructions were framed.

It is, however, not difficult for an agent, sometimes no doubt unwittingly, to exceed his authority, or act outside the scope of his instructions, and the question then at once arises, How far is the company bound to accept responsibility for his unauthorized acts? A somewhat similar question occurs should the agent neglect his duties, thereby possibly causing detriment to the persons assured through his agency or forming part of the clientele on his agency register.

The agent writes out a proposal form, which the proponent signs. This proposal contains misrepresentations of material facts sufficently serious to vitiate the contract. In such a case, is the agent, the employe of the company, acting for the company or the proponent? In other words, at what point does the agent cease to represent his company and become the agent of the proponent? An agent may be trusted by the proponent to properly answer the questions in the proposal, and, in doing so, withholds information with which he has been supplied. Is the company liable to recognize the contract, completed on the faith of that proposal, as valid? An agent may attract proponents by misrepresenting the position of his company. Is the penalty for such misrepresentation to be held at the door of the company? Again, an agent may make use of literature not authorized by his superiors in endeavoring to beat a rival company for business. How far is the office employing him responsible? Libels may actually be published in the guerilla warfare that occasionally arises between the agents of competing offices. Can the companies be brought to book for such practices, which they are hardly likely to confirm?

At all points in our discussion we are confronted with a consideration of the law governing the rights of third parties when dealing with a principal through the instrumentality of an agent, and it is not consoling to have to acknowledge that a perusal of various text-book pronouncements on the subject of agency does not present the law on this important matter as being too clearly defined,—at least, so it seems to the layman. Misrepresentation is the most common complaint laid at the agent's door, and for which in many cases it has been sought to make the employing company liable. Several extracts from the text-books may be quoted here with advantage. In one place it is stated (Anson on Contracts, 8th edition, p. 428): "If the agent commits a fraud in the course of his employment, he is liable, and so is his principal. If he commits a fraud outside the scope of his authority he would be liable, but not his principal."

The interpretation to be placed upon these two sentences appears to be governed by the meanings attachable to the phrases, "in the course of his employment" and "outside the scope of his authority" respectively, and it would seem, judging by the tenor of various legal decisions, that an agent making misrepresentations while obtaining a proposal is acting in the course of his employment, while attempts are often made to prove that he is acting within the scope of his authority, so as to make his principal liable.

There are a couple of cases which will be of interest and to which attention may be called. In one (Wilson v. Mutual Life Association of Australasia—1902—Supreme Court of New South Wales) it was decided that a country agent authorized to solicit proposals for new policies, collect premiums on existing policies and interest on mortgage loans, was not an agent empowered to receive repayment of principal moneys due under mortgage, and that the agent's fraudulent representation that he had the extended authority could not bind the company in the face of the express stipulation in the mortgage deed requiring repayment of the principal in Sydney. The court was of opinion that the agent had clearly acted outside the scope of his authority, and refused to hold the association liable in an action instituted to recover principal money paid to the agent. In the other (the Russo-Chinese Bank v. Li Yan

*A paper read before the Insurance Institute of New South Wales.

Sam—1910—Privy Council) a Chinese official, employed by the Russo-Chinese Bank to assist Chinese customers in securing proper attention to their wants, acted, to the knowledge of the customer, in excess of his authority, and the bank, on appeal, was held not liable for a loss sustained by the customer. The Privy Council made it evident in their judgment that where a person knows he is dealing with an agent whose authority is limited he is practically put on inquiry as to the extent of the agent's power to bind his principal. In both these cases the limited authority of the agent was clearly known to, or readily ascertainable by, the person concerned, but, in insurance business, it is not always easy for the prospective assurer to learn whether or not the agent, employed by the company, is exceeding his authority, and hence, no doubt, the number of court cases in which the companies are made to suffer for the wrongful acts of their agents.

In yet another case (Bannantyne v. MacIver and Co., 1905) it was sought to make defendants, who were shipbrokers, liable for a loan contracted by their agent in excess of his authority, he having induced the plaintiff to make the loan on the representation that it was required for defendant's business. It was successfully pleaded that borrowing money was not part of the usual business of a shipbroker, and, moreover, that the agent had no express authority to borrow. Where, however, "it was incidental to the business that bills should be drawn and accepted from time to time by the manager," it was held that the principal was liable on bills drawn by his manager, although the latter had been forbidden to do so. (Bushell v. Jones, L. R., 1 Q B., 97.) This last case is interesting as showing how a principal may be liable for acts of his agent performed in the ordinary course of the business in which he is employed, and that a secret reservation is no protection to the principal unless the person dealing with the agent is aware of the reservation.

The responsibility of the principal for the representations of his agent is also put by another authority as follows (Pollock on Torts, 5th Edition, pp. 291-2):

"The principal knows the contrary of the representation to be true, and it is made by the agent in the general course of his employment, but without specific authority.

"Here, if the agent does not believe his representation to be true, he commits a fraud in the course of his employment and for the principal's purposes, and, according to the general rule of liability for the acts and defaults of an agent, the principal is liable.

"If the agent does believe the representation to be true, there is a difficulty, for the agent has not done any wrong, and the principal has not authorized any. Yet the other party's damage is the same. That he may rescind the contract, if he has been mislead into a contract, may now be taken as settled law.

"If the principal does not expressly authorize the representation, and does not know the contrary to be true, but the agent does, the representation being in a matter within the general scope of his authority, the principal is liable, as he would be for any other wrongful act of an agent about his business. And as this liability is not founded on any personal default in the principal, it equally holds when the principal is a corporation."

We have also (per Broom's Legal Maxims, 6th Edition, pp. 751-2):

"If an agent is guilty of fraud in transacting his principal's business the principal is responsible. The fraud of the agent who makes the contract is the fraud of the principal, and, with respect to the question whether a principal is answerable for the act of his agent in the course of his master's business, and for his master's benefit, no sensible distinction, it has been observed, can be drawn between the case of fraud and the case of any other wrong. The general rule is that the master is answerable for every such wrong of the servant or agent as is committed in the course of the service and for the master's benefit, though no express command or privity of the master be proved."

Later on in the same work (p. 755), the following, however, appears: "To make out fraud, some wilful misrepresentation must be shown, and * * * a mere untruth innocently told is not sufficient," from which it would seem that a misrepresentation must amount to fraud to entitle the aggrieved party to claim relief from the principal.

The foregoing extracts probably represent the law, which requires to be fitted to each fresh set of facts, and is applicable more particularly to the agent as a new business writer. It is, however, necessary to point out that in discussing any phase of a contract it is essential to remember that there can be no valid contract unless the object of such contract be legal. In connection with life assurance transactions this distinction was brought into prominence some years ago in England, owing to the practice that had apparently grown up among the industrial classes of assuring the lives of their relatives although having no insurable interest therein. Had there been no question of misrepresentation by the companies' agents the plaintiffs in these actions would invariably have lost their cases, as policies obtained in contravention of the Life Assurance Act of 1774 (the Gambling Act) are absolutely void. But in nearly every case it was alleged that the policy would not have been effected but for the representations and persuasions of the company's agent, and it was accordingly sought to make the companies liable by compelling a rescission of contract and refund of premiums paid. A large number of the actions never got beyond the county courts, and a perusal of the decisions of the various judges presiding over these courts gives food for wonderment and evidences that the saying "quot homines tot sententiae" is as applicable to lawyers as to other folk. Being courts of co-ordinate jurisdiction, they are not bound by one another's decisions, of which necessarily there is an abundant variety. The fact that the plaintiffs were generally people of a class not readily understanding legal matters and therefore more easily misled, no doubt, might have had a good deal to do with the varied decisions recorded.

In two well-known cases divergent views were taken of a company's responsibility for the act of its agent in persuading people to effect illegal insurances. In the first (British Workman's Assurance v. Cunliffe, 1902), the agent was held to have fraudulently misrepresented that such an assurance would be legal, and the company was ordered to refund the premiums. This decision was in conflict with an earlier one (Howard v. Refuge Friendly Society, 1886), refusing a refund of premiums in the case of a similar illegal insurance, but in this case the question of the intervention of the company's agent did not arise. Again, in 1904, it was decided, on appeal (Harse v. Pearl Life Company), that where the agent had made an innocent misrepresentation regarding the legality of the insurance the person effecting the policy was not entitled to recover the premiums. This last decision was only registered on appeal, for the low court held that the agent should have had such knowledge of his business as would have prevented him from soliciting proposals for illegal insurances. From an article in the "Insurance Record" (London) for 1908, p. 218, it appears that the decision in the last-mentioned case was approved by the Appeal Court in "Brown v. the Britannic" (of which, however, I have not been able to see a proper report), where it was also laid down that persons claiming refunds of premium would require to show a fraudulent intent on the part of the agent. The case of Johnson v. Refuge Assurance Company, decided last year in the Court of Ap-

peal, is interesting, inasmuch as, although the jury "decided that the policy was not induced by fraud, but by statements made by the company's agent recklessly," the company was compelled to repay the premiums on account of its agent's "reckless" action, thus treating recklessness in the same manner as fraud.

It will be noted that all the cases quoted above concerned friendly societies and industrial companies. The sums at stake in every case were very small, and there is no doubt that opportunities for the considerable amount of litigation that did take place would have been wanting had the policies been effected with ordinary companies whose custom it is, usually, to ask for some proof of insurable interest before issuing a policy. Although the insurances in question transgressed the law regarding insurable interest, they were usually effected for the bona fide purpose of covering funeral expenses, and as such were duly honored. The stream of litigation, however, was so serious that the companies concerned arranged for the insertion of a clause in the Assurance Companies Act of 1909 to make existing assurances of this nature legal. Section 36 of that Act permits assurances with industrial companies for funeral expenses of a parent, grandparent, grandchild, brother or sister, and also legalizes assurances, effected before the passing of the Act, to provide a sum to meet funeral expenses in such cases as the insured had a bona fide expectation of being called upon to incur such expenses, the amount assured to be not unreasonable for the purpose. A further stipulation subjecting companies to a penalty for issuing policies outside the scope of their legal powers is also included in Section 36, so that the abuse which did exist, and which was probably to some extent fostered by the agents, has been checked in England, where agents are not now likely to be permitted to render their companies liable for penalties by persuading the public to effect illegal insurance of the nature indicated. The proposed Commonwealth legislation on insurance includes a clause somewhat similar to Section 36 of the English Act.

In a case in the Appeal Court last December (Tofts v. Pearl Life Assurance Company) it was laid down that Section 36 in the Act of 1909 would not prevent an action for refund of premiums being sustained if the agent act fraudulently in representing that policies not supported by a recognized insurance interest were valid. The policies in question were effected in 1902 on the life of the plaintiff's father, and his contention was that the agent acted fraudulently in persuading him to effect them. The decision of the court was not unanimous, but if it be upheld in future cases of similar character, the companies will not yet be quite free from the old trouble caused by speculative solicitors encouraging litigation for rescission of contract.

(To be Continued)

ACTUAL EXPERIENCE OF AMERICAN LIABILITY INSURANCE COMPANIES WITH WORKMEN'S COMPENSATION IN 1913

THE New York "Journal of Commerce," in its issue of September 8, has published a review of the actual experience in 1913 of all the more important liability and casualty insurance companies, in respect of the workmen's compensation business done by them in 1913. According to the "Journal of Commerce," this review has been prepared by a prominent actuary, and is based upon the statements of the companies for the year 1913. The important point is brought out that the business, as shown by the statements, showed on underwriting loss of 1.1 per cent; inasmuch as the amounts set up as statutory reserves are in the opinion of all students of the subject inadequate to meet the actual losses that will finally have to be met against the business of 1913, and as not all companies are as yet setting up reserves greater than the statutory requirements, it may be taken as certain that the ultimate underwriting loss on the 1913 business of all the companies together will be considerably in excess of the 1.1 per cent here shown. The following is the statement of the actuary quoted by the "Journal of Commerce":

"As an insurance student, interested particularly in workmen's compensation, I have noted the rapid development of the movement to force down the rates for compensation insurance, apparently regardless of the results. I have heard and read with great interest the comments, criticisms and positive statements of State boards, commissions, investigating committees and inspired statesmen, all to the effect that the insurance companies are reaping great profits from workmen's compensation. So much has been written and said on the subject and so many positive statements have been made by those knowing little about it, that the average person now feels that insurance companies are making far too much money from workmen's compensation. If all these general statements were anything like correct it would seem that of course the compensation rates were too high and therefore it would seem that the experience of the companies as regards workmen's compensation would show large profits. I find, however, that such is far from being the case.

"I have just finished going over the attached compilation of the experience of practically every insurance company, with about one or two exceptions, doing compensation business in the United States. From such experience, collated by an independent organization, I find that in the year 1913 nearly $12,000,000 in compensation premiums were written in the States having compensation laws, and on that business the general average of result is the loss of one and one-tenth per cent on the premiums written. In other words, for every dollar of premiums written the companies will pay $1.11. This shows a serious situation and one which should be remedied by proper rates. However, remarkable to relate, it seems the agitation for still lower rates since 1913 has been successful in some States and may be successful in other States. The results for 1913 as shown are decidedly unfavorable to the companies and yet it looks as though the situation may be made worse by rate reductions, even though at the rates in 1913 the companies instead of making even a small profit lost money.

"The results for 1913, as shown by the figures, is not a matter of argument. It seems simply a cold statement of facts. The companies do not make their showing any worse than they can possibly help. The general tendency is to make the reports as glowing as possible, so much so that the experience here and abroad has shown that estimates for outstanding compensation losses are nearly always too low and that the companies have had to pay more for such outstanding losses than they expected. Insufficient rates mean danger, not only to the companies, but to the general public in every phase of industry. Insurance companies are far too necessary in our economic industrial life to be allowed to ruin themselves against their better judgment, and yet this is what seems probably will result.

"From the complaints of brokers and agents and from newspaper articles from time to time, it would seem that the companies are trying hard to reduce their expenses to the lowest possible point, and yet in spite of that the combined experience for 1913 is bad.

"There is some excuse for those not in the insurance business to consider that rates are too high, but the companies have known of this 1913 experience for a number of months, and yet a number of the companies are agitating still lower rates and trying to get them put in force, although why they do that is more than I can

understand. Surely they do not want to deliberately ruin themselves and ruin all liability insurance companies, and yet to a disinterested person standing to one side watching the figures and noticing the experience and watching the efforts of the companies it would almost seem that some of the companies are bent on ruining themselves, either to allay unthinking criticism or to offer themselves as a horrible example of the results of inadequate rates. Why, with the figures of 1913 in mind, is there talk of reducing the rates instead of increasing them?"

UNITED STATES WORKMEN'S COMPENSATION BUSINESS EXPERIENCE IN 1913, TAKEN FROM PUBLISHED DETAIL STATEMENTS OF INDIVIDUAL COMPANIES.

THE COMPLETE AND FINAL TEXT OF THE WAR RISK INSURANCE ACT

BELOW is given the complete and final text of the War Risk Insurance Act, as it was signed by President Wilson and became law. Owing to the fact that, in the course of the passage of legislation by Congress, final amendments which are adopted and incorporated in a bill, whether in the two Houses of Congress or by a Conference Committee of the two Houses, are not embodied in a fresh reprint of the bill, but appear only in the engrossed copy submitted to the President and, after the President's signature is affixed, in the comparatively little known Public reprint of the Act, it frequently happens that an act is in some respects inaccurately published by the press. This has happened in more than one publication in the case of the present Act. The true and final text of this law, which makes an important new precedent in American legislations, is accordingly reprinted below, as signed by President Wilson on September 2, 1914.

* * *

[PUBLIC—No. 193—63D CONGRESS]
[S. 6357.]

AN ACT to authorize the establishment of a Bureau of War Risk Insurance in the Treasury Department.

Whereas the foreign commerce of the United States is now greatly impeded and endangered through the absence of adequate facilities for the insurance of American vessels and their cargoes against the risks of war; and

Whereas it is deemed necessary and expedient that the United States shall temporarily provide for the export shipping trade of the United States adequate facilities for the insurance of its commerce against the risks of war: Therefore

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That there is established in the Treasury Department a bureau to be known as the Bureau of War Risk Insurance, the director of which shall be entitled to a salary at the rate of $5,000 per annum.

Sec. 2. That the said Bureau of War Risk Insurance, subject to the general direction of the Secretary of the Treasury, shall, as soon as practicable, make provisions for the insurance by the United States of American vessels, their freight and passage moneys, and cargoes shipped or to be shipped therein, against loss or damage by the risks of war, whenever it shall appear to the Secretary that American vessels, shippers, or importers in American vessels are unable in any trade to secure adequate war risk insurance on reasonable terms.

Sec. 3. That the Bureau of War Risk Insurance, with the approval of the Secretary of the Treasury, is hereby authorized to

adopt and publish a form of war risk policy, and to fix reasonable rates of premium for the insurance of American vessels, their freight and passage moneys and cargoes against war risks, which rates shall be subject to such change, to each port and for each class, as the Secretary shall find may be required by the circumstances. The proceeds of the aforesaid premiums when received shall be covered into the Treasury of the United States.

Sec. 4. That the Bureau of War Risk Insurance, with the approval of the Secretary of the Treasury, shall have power to make any and all rules and regulations necessary for carrying out the purposes of this Act.

Sec. 5. That the Secretary of the Treasury is authorized to establish an advisory board, to consist of three members skilled in the practices of war risk insurance, for the purpose of assisting the Bureau of War Risk Insurance in fixing rates of premium and in adjustment of claims for losses, and generally in carrying out the purposes of this Act; the compensation of the members of said board to be determined by the Secretary of the Treasury, but not to exceed $25 a day each, while actually employed. In the event of disagreement as to the claim for losses, or amount thereof, between the said bureau and the parties to such contract of insurance, an action on the claim may be brought against the United States in the District Court of the United States, sitting in admiralty, in the district in which the claimant or his agent may reside.

Sec. 6. That the Director of the Bureau of War Risk Insurance, upon the adjustment of any claims for losses in respect of which no action shall have been begun, shall, on approval of the Secretary of the Treasury, promptly pay such claim for losses to the party in interest; and the Secretary of the Treasury is directed to make provision for the speedily adjustment of claims for losses and also for the prompt notification of parties in interest of the decisions of the bureau on their claims.

Sec. 7. That for the purpose of paying losses accruing under the provisions of this Act there is hereby appointed, out of any money in the Treasury of the United States not otherwise appropriated, the sum of $5,000,000.

Sec. 8. That there is hereby appropriated, for the purpose of defraying the expenses of the establishment and maintenance of the Bureau of War Risk Insurance, including the payment of salaries herein authorized and other personal services in the District of Columbia, out of any money in the Treasury of the United States not otherwise appropriated, the sum of $100,000.

Sec. 9. That the President is authorized whenever, in his judgment, the necessity of further war insurance by the United States shall have ceased to exist, to suspend the operations of this Act in so far as it authorizes insurance by the United States against lass or damage by risks of war, which suspension shall be made, at any event, within two years after the passage of this Act, but shall not affect any insurance outstanding at the time or any claims pending adjustment. For the purpose of the final adjustment of any such outstanding insurance or claims, the Bureau of War Risk Insurance may, in the discretion of the President, be continued in existence a further period not exceeding one year.

Sec. 10. That a detailed statement of all expenditures under this Act and of all receipts hereunder shall be submitted to Congress at the beginning of each regular session.

Sec. 11. That this Act shall take effect from and after its passage.

Approved, September 2, 1914.

The Bureau of War Risk Insurance in the Treasury Department has been formulating rules of procedure and will shortly issue instructions governing fully the issuance of war risk policies. It is understood that Collectors of Customs will be the agents for writing insurance in each port. Upon application to the local Collector, he will wire to the Bureau at Washington the facts covering the ship, cargo and destination, and the Bureau will wire back the rate.

The basis upon which rates will be made will naturally be the degree of risk involved. Thus a fast ship will command a lower rate than a slow ship; a cargo of salt a lower rate than a cargo of coal; and a ship destined for South America a lower rate than one destined for Liverpool. It is stated that in no case will war risk insurance be issued to an amount in excess of the marine insurance taken out upon the vessel and cargo subject to the application.

Up to the present time, it is said, the number of inquiries for war risk insurance does not indicate that there will be a particularly large amount of business. It is suggested in Washington that the bulk of vessels flying the American flag will seek South American ports for the reason that they are thus reasonably assured of return cargoes, whereas in carrying goods to European ports they run the risk of returning empty. This, of course, is entirely aside from the question of the really hazardous character of voyages in European waters, and the added cost of war risk insurance.

NOTES ON INSURANCE, AMERICAN AND FOREIGN

Fire Losses in August.—The fire loss of the United States and Canada for the month of August as compiled from the records of "The Journal of Commerce" shows a total of $11,765,650, a very great reduction from the August, 1913, figures. The following table gives a comparison of the losses by months this year with those of the same months in 1913 and 1912, together with the monthly record for the balance of those years:

	1912.	1913.	1914.
January	$35,653,150	$20,193,250	$23,204,700
February	28,601,650	22,084,600	21,744,200
March	16,650,850	17,511,000	25,512,750
April	16,349,400	16,738,250	17,700,800
May	21,013,950	17,225,850	15,507,800
June	16,103,450	24,942,700	23,348,000
July	15,219,100	20,660,900	17,539,800
August	14,158,800	21,180,700	11,765,650
Total eight months	$163,750,350	$160,037,250	$162,323,700
September	$13,779,300	$17,919,300	.....
October	13,651,650	14,932,750	.....
November	16,172,300	15,207,600	.....
December	17,967,000	16,126,450	.....
Total for year	$225,320,900	$224,723,350	.....

* * *

Telegraphists' Cramp as an Industrial Disease.—The "Insurance Observer," of London, recently called attention to a kind of industrial disease which, so far as we know, has thus far never been registered in the United States. We quote as follows:

"It was stated by a delegate at the recent congress of the International Federation of Postal and Telegraph Servants that telegraphists' cramp was increasing in England at an alarming rate. So long ago as 1911 this occupational disease, which arises from the use of the Morse instrument, was inquired into by a departmental committee. It was then found that about 4.4 per cent of the telegraphic operators were affected. The increase of the complaint is attributed by the operators themselves to the system of speeding up which has been recently introduced into the telegraphic service.

"The committee of inquiry found that the disease called 'tele-

graphists' cramp' is seated in the central nervous system and is a weakening or breakdown of the cerebal controlling mechanism in consequence of musculant strain. A telegraphist suffering from this malady in an advanced stage can expect no cure unless he or she is removed completely from the service. The forearm, hand, and fingers become numb and cease to answer to the nerves and muscles. In some cases the power to hold a knife and fork is lost.

"If a sufferer takes to using his left hand to relieve the other in the manipulation of the Morse instrument, that hand will sooner or later become affected. There is also a danger of the cramp spreading to other limbs. The first sign of the disease is an inability to form one or another of the letters of the Morse alaphabet. The number of letters which the operator cannot transmit increases until there is not one which he is capable of sending. To overcome the difficulty the operator will alter the method of working the instrument, but eventually he will exhaust all the different ways in which he can send a message.

"The operator in transmitting a message at twenty words a minute makes 150 different movements, and at times of great pressure the muscular effort increases. Nor is the effort so expended only muscular and nervous."

* * *

Workmen's Compensation Business in France in 1913.—The French insurance journal, "L'Argus," has recently compiled figures for amount of workmen's compensation business written in France in 1913, whether by private liability companies or by mutual companies and employers' syndicates or associations. Under the French law, as is well known, the insurance of employes against industrial accidents is compulsory, but the employer may take out insurance with any one of the above kinds of insurance carriers. In the statistics of "L'Argus" for 1913, the amount of the accrued losses is not given, the figures not being yet available. Nevertheless, the amount of wages insured, the premiums collected and the number of accidents (evidently including hold-over cases), for virtually all of the carriers of workmen's compensation in France are decidedly interesting. The figures are given in the following table [franc = 19.3 cents]:

WORKMEN'S COMPENSATION BUSINESS IN FRANCE IN 1913.

	Wages Insured (Francs).	Workmen's Compensation Premiums (Francs).	No. of Accidents Compensated.	Total Premiums of all Kinds (Francs).
18 French stock companies	3,944,925,053	80,081,980	419,192	170,226,871
6 foreign stock companies	1,245,557,921	25,530,383	134,646	147,604,540
24 French mutual companies	1,443,863,787	37,540,459	235,620	55,318,101
14 French syndicates	223,512,756	4,805,525	28,145	?
Totals	6,857,859,517	147,958,347	817,603	373,149,512

It will be observed that the ratio of the workmen's compensation premiums collected to the total amount of wages insured was 2.15+. This is the highest premium ratio as yet attained under the French workmen's compensation law. Inasmuch as the companies and associations writing this insurance in France are required to set up each year proper actuarial reserves, this percentage, 2.154+, represents the true average premium cost for the year, and does not, like the German 1.75 per cent, represent merely what has to be paid out during the current year, without provision of reserves to meet future payments of pensions, etc., arising from the current and past years' accident experience. In conclusion, it may be remarked that it is a decidedly interesting fact that the accident and liability premiums, other than those for workmen's compensation, for all the companies operating in France in 1913, amounted to no less than 225,200,000 francs, or some 78,000,000 francs more than the workmen's compensation premiums proper.

The Decision in the Kaye Case.—"Safety Engineering," New York, has published an analysis of the case of People vs. Kaye by Albert de Roode, Assistant Corporation Counsel of New York City. It will be remembered that Fire Commissioner Adamson brought suit against one Kaye for the cost of fighting a fire in Kaye's establishment on the ground that previous to the fire Kaye had been instructed by the Board of Fire Commissioners to install an automatic sprinkler system but had failed to comply with these instructions. Mr. de Roode's analysis is as follows:

* * *

The gist of the decision by the Court of Appeals in the case of People vs. Kaye is that the fire commissioner has authority to require the installation, in a proper case, of automatic sprinklers in certain classes of buildings, including factories, specified in the ordinance of December 19, 1911. A failure to comply with an order issued by the fire commissioner constitutes a misdemeanor. By proper procedure any person served with such an order may contest the reasonableness of it in court.

The main point involved in the case was whether the expression "fire hose, fire extinguishers, buckets, axes, fire hooks, fire doors and other means of preventing and extinguishing fires" used in the ordinance included so extensive an equipment for extinguishing fire as an automatic sprinkler system. On this point the court stated:

"The words of section 762, which speak of certain kinds of fire extinguishing apparatus, are not exhaustive, and the comprehensive words 'other means of preventing and extinguishing fires' which follow should be held to include other means of the same general character and purpose as those particularly enumerated. Now, automatic sprinklers, though they may cost a little more than the articles specifically mentioned in the section, are of the same general character and are intended for the same purpose as those articles."

The history of this ordinance is interesting. The Consolidation Act of 1882 contained a provision, section 454, that in certain buildings there should be "such means for communicating alarms and extinguishing fires" as the Board of Fire Commissioners should provide. This section came down from a law passed in 1871. By Chapter 703 of the Laws of 1892 the expression "such means of communicating alarms and extinguishing fires" was elaborated to the present language of the ordinance, and in the Greater New York Charter of 1897 what had been section 454 of the Consolidation Act became section 762. By the Amendatory Act of 1901 section 762 was continued in force only until the Board of Aldermen should pass ordinances covering the subject matter of that section. On December 19, 1911, the Board of Aldermen enacted an ordinance in the same wording as section 762, tacking on to it a provision allowing standees in theatres.

The general principle involved in the Kaye case, it seems to me, is that the Legislature has the right to confer upon an administrative officer the power to require adequate means of protecting buildings from the dangers and hazards of fire, and that the general rule governing the exercise of administrative discretion applies in such cases. This rule is that the exercise of administrative discretion, particularly affecting property interests, must not be arbitrary, capricious or unreasonable. Whether in a particular case the installation of a sprinkler equipment is a reasonable requirement depends upon the facts. Where the facts justify the sprinkler equipment no court will interfere. The difficulty will arise in what may be called border line cases, where there is an honest difference of opinion as to whether the conditions require a sprinkler equipment or not.

In all such cases the benefit of the doubt, so to speak, will be given by the court to the order of the fire commissioner.

INSURANCE NEWS IN THE WEST

Ill-feeling in Illinois Over Action of Superintendent Potts.—There is considerable bitter feeling among fire underwriters over the action of Superintendent Potts, of Illinois, in starting suit against the fire companies at this time. It is not to be presumed that the companies would take it kindly at any time, but they object especially to being made defendants when they already are carrying so heavy a load on account of financial conditions. With stock markets closed it is impossible to place an exact valuation on their assets. This gives oportunity for the timid or unfriendly to suspect that their condition is not as good as it is. Add to this the uncertainty as to the amount of reinsurance being carried in unauthorized foreign companies about whose condition little is definitely known and the well-grounded fear of what would happen to some companies in case of a great conflagration, and underwriters think the companies have enough to contend with without being attacked just at this juncture by a State official.

The course pursued by Superintendent Potts may be making political capital for the administration of Governor Dunne. It is also making enemies and very bitter ones. There is talk in some quarters of attempting to prevent the confirmation of Mr. Potts by the State Senate when the new Legislature goes into session. He was appointed during recess. The next State Senate may be unfriendly to the Governor. There are two good chances that it will be. One is that the Democrats will not control it at all, and the other is that the Democrats elected will be largely of that section of the party whose chief the Governor has been attacking. Should an effort be made to prevent the confirmation of Mr. Potts as Superintendent of Insurance, his opponents will not be merely those who have been incensed at his bringing these suits at this time. His attitude towards other stock insurance companies has been unfriendly, as shown by various actions favorable to inter-insurers.

* * *

Support for Girardin for Life Underwriters' Presidency.—Chicago friends of Jules Girardin, general manager of the Phoenix Mutual Life in this city, are talking of him as a candidate for the presidency of the National Association of Life Underwriters. While he has not entered the lists, his friends think he would make a good dark horse should the avowed candidates fail of election. There is no question among those who know Mr. Girardin that he would make a great president if elected. He was one of the principal organizers of the General Managers' Association of the Phoenix Mutual Life and its first president, and he did splendid work in that capacity. He was president of the Chicago Association of Life Underwriters and it made long strides during his administration. Those who attended the Chicago meeting of the National Association in 1911 remember with pleasure his handling of the entertainment features of that gathering. He is one of the best fellows in the business. He was at one time a special agent of a large fire general agency in Texas and he has the qualities of a "mixer" that fire insurance field work develops in so many men who engage in it. He has a fine vein of humor, is a good presiding officer, has made a success of life insurance and is a strong worker in the organization movement.

* * *

Federation Movement Strong in the West.—The insurance federation movement is showing considerable strength in the West. It started in Ohio after the liability business had been largely destroyed by workmen's compensation with exclusive State insurance and fire insurance was threatened with adverse legislation. Last year, after the fire insurance troubles in Missouri, that field was ripe for the organization of a federation and the one that was started has done some very effective work. At the recent meeting of the National Association of Insurance Agents, at Minneapolis, President W. S. Diggs, of the Ohio Federation, was one of the speakers and what he told of conditions in Ohio, especially in the casualty business, impressed his hearers. All classes of insurance men have a fight on their hands in Wisconsin to prevent the adoption of the constitutional amendments which would permit the State to enter the insurance business generally, and conditions there are right for the introduction of the federation idea. While Minnesota is not immediately threatened with State insurance, it has Wisconsin on one side and on the other North Dakota, which already has a public form of hail insurance and attempted to have a State bonding fund, which was prevented only by the Supreme Court's declaring the law unconstitutional. With such sentiment in the neighborhood, leaders in all classes of the insurance business in Minnesota have considered organization of a federation before their business is threatened instead of waiting till it may be attacked. A call for a conference at Minneapolis on Friday of this week was issued some days ago, with a view to organizing a federation if it should be decided to be advisable. The aim of these federations is to combine insurance men generally, fire, casualty and life, to look after the interests of all.

* * *

Workmen's Compensation in Oklahoma.—From Oklahoma comes word that lively contest is expected there this Winter over workmen's compensation. The belief is held by some that it will be impossible to enact the sort of a law that is wanted without first amending the Constitution. An effort was made to do this in 1913, but it failed. Now it appears that considerable State insurance sentiment has developed in the State, particularly among the organized laboring men. The employers are said to be opposed to this plan for the most part. It is predicted that efforts will be made to eliminate a compensation law with State insurance, to enact one without State insurance and to get one initiated and put up to the people themselves for action.

* * *

Liability Troubles in Texas.—A question of considerable importance has been before the Attorney General of Texas. Homer R. Mitchell, general manager of the Texas Employers' Insurance Association, has contended that the policies issued by his organization and also by the stock companies cover common law liability as well as workmen's compensation. The insurance department is reported to have taken an opposite view. If Mr. Mitchell's contention should eventually be sustained, it would make the way of the liability companies even harder than it is now. When the insurance department designated the rates which it would approve if the Texas Employers' Insurance Association would file them, they were promptly filed and became the standard rates of the State, more than which no company could charge, except as they might be modified by a merit rating system. They were so low that a number of the companies refused to write business at them and retired from the workmen's compensation field. Those that remained, however, charged the standard rates for workmen's compensation only, with an additional rate for the common law or statute liability to which employers might be exposed although under the compensation law. The sum of these two rates is said usually to have been equal to the old rates which the companies themselves filed last Fall and which were in force until Spring. It has been Mr. Mitchell's aim to get the rates so low as to drive the casualty companies out, leaving a clear field for his institution. If

he could make them cover employers' liability as well as compensation for the standard compensation rates, he would have made another long step towards the accomplishments of his purpose.

LA SALLE.

Chicago September 11, 1914.

ITEMS OF INSURANCE NEWS.

Commissioner Winship, of Michigan, is opposed to policy loans and in favor of the enactment by the Michigan Legislature of the bill drafted by the National Convention of Insurance Commissioners providing that no policy shall be issued by any legal reserve company unless it gives the company the right to defer the granting of a policy loan or cash surrender value for a period of sixty days within the State in which the bill has been enacted.

Deputy Insurance Commissioner Hodgkins, of Massachusetts, last week defined the congested district of New York on which he requires information as to amounts at risk of property insured therein by the various companies as follows: Beginning with the Battery, north along the Hudson River to Twenty-third Street; east through Twenty-third Street to Broadway; south through Broadway to the Bowery and Delancey Street; east through Delancey Street to the East River; along East River to original starting point.

Governor Blease, of South Carolina, has signed the Lawson-Harper-McCravy vital statistics bill, and it now becomes a law. Some of the provisions of the measure are that the Secretary of the State Board of Health shall be State Registrar of Births and Deaths and that the State Board of Health shall establish a bureau of vital statistics. The measure further provides that the State shall be divided into registration districts and local registrars be appointed, to record births, deaths, etc.

Governor Dunne, of Illinois, has set apart October 9 as Fire Prevention Day in that State, while Governor Ralston, of Indiana, has initiated a new movement by appointing October 2 as Disease Prevention Day.

Governor Ferris, of Michigan, has appointed Thomas B. Gloster, of Detroit, a member of the State Industrial Accident Board to succeed Ora E. Reaves, whose term of office has expired.

Edward A. Woods, president of the Edward A. Woods Agency, Inc., of the Equitable Life Assurance Society, proposes to carry to the Supreme Court of the United States the ruling of the Treasury Department that general agents' renewal commissions, if received during the period of March 1 and December 31, 1913, are subject to the income tax. Mr. Woods endeavored to secure the co-operation of other life insurance men to test the ruling of the Treasury Department, but failing in this, he has determined to test the point himself.

As but 25 per cent of the business establishments of Montreal are equipped with sprinklers for fire protection, Chief Tremblay will recommend to the committee on legislation that means be taken to have all business houses fitted up with these sprinklers. Chief Tremblay states that in many American cities it was left to the discretion of the fire department to order the installment of sprinklers and he would suggest something of the kind for Montreal.

Superintendent Hasbrouck, of the New York Insurance Department, has issued a statement calling attention to the unnecessary delays, due to lack of method and carelessness on the part of the insurance companies, in payments under the workmen's compensation act and urging their immediate remedy.

The executive committee of the Chicago Board of Underwriters has made a reduction of 2½ cents in all sprinklered risks in the congested value district, except fireproof buildings.

Many companies have arrived at their net figures in the congested district of Boston and the inquiry of the Insurance Commission of Massachusetts has already resulted in a number of managers notifying their Boston agents to drop lines in the congested district there. One strong institution intends to cut its congested amount at risk over 60 per cent, and others will make drastic reductions. It is very clear that in the immediate future the surplus line companies can secure more Boston business than they can digest at 10 or even 7½ per cent commission, and that in course of time they can safely demand more than the at present inadequate tariff rates.

Companies in Kentucky writing tobacco hail insurance agree that the results of the 1914 season, as in 1913, have been unprofitable. The experience of this season, in spite of careful adjustment, has shown that the rates are too low, and a fifty per cent increase is now being discussed. Some of the companies state that unless the increase is put into effect they will discontinue writing this class.

The action of the Aetna at Fort Worth, Tex., in withdrawing its discount of 50 per cent from manual rate on automobile insurance, effective September 1, is believed to have ended the automobile rate war, as all of the other larger companies had already withdrawn the reduced rates.

Plate glass underwriters are much disturbed over the New York situation, which has become rather worse since the fact has been forcibly brought out that there are many more instances of excess commission being paid than was formerly admitted. The practice of appointing "agents" as a means of circumventing the 25 per cent brokerage rule has become more prevalent and it is charged that uncancellable contracts are being made right along.

A general ruling with regard to short term policies has been issued by the Compensation Rating Board, of which Leon S. Senior is manager, to the effect that in the case of workmen's compensation policies that are written in substitution of existing employers' liability policies for the unexpired term of such liability policies it is proper to pro-rate the minimum premium on policies which are subject to minimum premium charge.

Chief Engineer A. M. Schoen, of the South-Eastern Underwriters' Association, with his assistant, F. G. Tupper, and inspectors Jenkins, Cates and Rutsler, met with the authorities and a committee of the Board of Trade of Birmingham in that city Tuesday morning of last week to complete arrangements for a thorough investigation of conditions, looking to recommendations that it is expected will be of great service in decreasing the fire waste of that city. Mr. Schoen said that it was strictly an engineering proposition and that the investigation would be a thorough one, including the inspection of all mercantile, factories, schools, churches, etc., and the water works and fire department. The authorities and the committee of the Board of Trade promised full co-operation with the associations. Four inspectors of the association are now engaged on the work, which may require several weeks to complete.

The Insurance Society of New York has announced a series of thirty lectures on loss adjustment which will extend over a period of two years. They will be held monthly throughout the Fall, Winter and Spring on the second and fourth Tuesday of the month in the assembly room of the New York Board of Fire Underwriters. Allen E. Clough, secretary of the loss committee of the New York Board, has charge of the series and has assisting him a committee familiar with adjustment work.

George L. Cutter has begun suit in the Supreme Court to restrain the New York Fire Insurance Exchange from depriving him of his membership in the Exchange and also to restrain three fire insurance companies which he represented in this city from depriving him of the agency. Mr. Cutter has been accused by the Exchange of increasing commissions paid to agents for business in violation of the rules of the Exchange. He denies these charges, and declares that no formal charges ever were served on him.

Fire insurance agents have long been objecting to banks or officers of banks being licensed as local fire insurance agents, especially in the large cities. One of the provisions of the National Reserve Bank Act excludes officers and employes of banks which are members of the reserve bank from accepting fees for any business carried on by the bank. This provision will not prevent officials of such banks from acting as agents for insurance companies, but they will not be permitted to accept commissions on business owned by the bank or controlled by it. Most of the bank insurance agencies are in the State banks, and an amendment to the National Reserve Bank Act is now pending permitting membership to State banks having a capital of $15,000 or more. Should this be carried it would materially affect the insurance agency situation.

Several new interpretations have been placed on clauses of the accident insurance policy, as a result of a recent decision of the Supreme Court of Arkansas in the case of Maloney vs. Maryland Casualty Co. of Baltimore, Md. The court held that where a policy required that notice of death or disability be given the company within a reasonable time, the beneficiary is entitled to recover, upon giving the required notice after the death of the policyholder, although the assured was living and conscious for a considerable period following the injury and gave no notice of the accident. The court held that there was no claim under the policy until death, and consequently, notice after death was within reasonable time. The court further held that where an injury is designedly brought about by another party, not the assured, it constitutes an accident under the terms of the accident policy.

A tabulation has been made of the experience for 1913 of the fire insurance companies operating in Western Union territory. The premiums were $109,182,281, written by 193 companies, with a loss ratio of 55.45 per cent, as against 53.02 per cent in 1912. The Union companies wrote 74.36 per cent of the total business, as compared with 73.62 in 1912, 70.30 in 1911 and 66.56 in 1910. The Bureau companies wrote 21.55 per cent of the business, as compared with 21.31 per cent in 1912, and 18.17 per cent in 1911. The non-affiliated companies showed a falling off, writing 4.09 per cent, as against 5.13 per cent in 1912, and 11.53 per cent in 1911. The loss ratio of the Union companies was 55.95 and of the Bureau companies 54 per cent, both showing an increase, and of the non-affiliated companies 53.96 per cent, also showing an increase.

The reports of twenty-seven companies to the New York Insurance Department show that, on the business of hail insurance, $1,710,607 was collected in premiums, with losses to the amount of $703,945, or a loss ratio of 41.2 per cent.

FINANCE AND COMMERCE

Market Prices of Securities and Commodities.

REVIEW OF THE FINANCIAL SITUATION

INDICATIONS have been furnished in the last few days that a good deal of initiative has been taken by a group of international financial interests in the direction of making peace between the warring nations of Europe. The circumstances are interesting as showing what a recoil against war has been caused by the Old World catastrophe and as a reminder of the power of finance to procure a termination of hostilities which it was not able to prevent. One of the chief reliances felt for years in the preservation of Europe's peace was the assurance that the bankers would be able to impose their will on governments. This reliance was, as usual, found illusory when the contributory circumstances of belligerency had been provided. On the other hand, it cannot be disputed that finance has more than once demonstrated its ability to bring combatants to their sense and end a conflict even prematurely. By many competent observers it has always been believed that precisely such a premature peace was effected in the Russo-Japanese war, but if so the fact is all the greater tribute to the banking power.

It is a question, however, if commercial and financial calculations can admit to the present reckoning any probable early success of peace measures which may be set afoot. Every friend of the human race will aid in every way possible to bring about an effective peace, and it is to be hoped that efforts for peace will be unceasingly exerted at every stage of the war. President Wilson's finely phrased proclamation of a day of prayer is a splendid expression of American aspirations and is representative of the influences which are operating for the restoration of sanity in Europe. Nevertheless, it is more than doubtful if any such point has been reached in the war as promises immediate reward for pacific negotiations. The new agreement signed between Great Britain, Russia and France holding the allies to unity of action in effecting peace suggests that mediation, intervention and everything else leading to a peace treaty are likely to be utterly futile until more decisive results have been achieved in the war itself.

Without entering into any detailed or summary consideration of the conflicting points of view of the warring countries, it suffices to say that the intelligent opinion of Europe, as of the rest of the world, will be reconciled only to a peace which has some prospect of permanency, because it is founded in war-compelled contracts that insure the elimination of the causes of the war now raging. Much, if not most, of the current discussion of the origin of the conflict, the attributions of responsibility and so forth is idle. The common sense view is more nearly the correct one, and according to this view a situation had been created in Europe which rendered war increasingly inevitable in the past decade. While it is true that a factitious advantage might apparently be gained to-day by the announcement of willingness on the part of one side to entertain peace proposals, thus seeming to throw the onus of blame for a continuation of the war on the other side, it is still more true that in the very nature of the war no peace can issue from it unless it is a more or less enduring setltlement, humanely speaking.

If dynastic ascendancies are to be perpetuated by a peace treaty, carrying with them the rule of a quasi-autocratic military caste animated by mediaeval conceptions of national policy, only temporary peace can be the outcome. If this war is to solve anything, its solution must be such as shall convert Europe into something else than an armed camp in time of peace. It must safeguard the national integrity of neutral States and must leave the door of opportunity open to different peoples to preserve a national life free from external political aggressions of any sort. Only in that way can the peace of the world be assured and the economic rehabilitation, which is the goal of commercial and financial desire, be guaranteed.

British finance has in the last few days had the satisfaction of witnessing the auspicious workings of its plans for a resumption of those money market activities on which depend as much international trade as is now possible in all lands. One cannot praise too much the sureness and intelligence with which the British Government and British bankers have co-operated to right conditions in the London money market. When the economic history of the war comes to be written it is likely, as appears now, that a principal part of it will be devoted to an examination of the successive steps adopted in London to revive international financial dealings and sustain foreign and domestic trade movements. The latest weekly return of the Bank of England shows further convincing evidence of the progressive improvement in the London discount market, and, unless the fortunes of war make havoc of the plans of British finance, it may fairly be assumed that further headway will be made in bringing about at least a partial renewal of all operations which the outbreak of the war paralyzed to some extent or altogether, including of course the business of dealing in securities without which there can be only a crippled re-establishment of the money markets.

So far British financial endeavor has had American assistance. It has been recognized on this side that on account of our debtor relation abroad and the lack, which will be repaired in time when our new banking system has been thoroughly incorporated in the country's economic structure, of facilities for providing a world money market, we would have to look to London for financial leadership in the war crisis. Unanimity does not yet obtain among American bankers and business men about the desirability of placing American resources at the service of international finance for the benefit of our own country, as well as of others, while the hazards of war make it risky to trust too much the ability of British finance to keep going. Moreover, there is a feeling here that opportunity offers for a concerted effective employment of American resources in ways that at no distant date will constitute this country the banker of the world. Yet on the whole assent has been given to the proposition that it is wise just now to see what can be done in setting up the machinery of finance and commerce which was broken down by the declaration of war abroad. Accordingly, energies have been engaged here in contriving processes which would make American gold available in reasonable quantity not only for the discharge of American foreign indebtedness, but to aid in restoring international dealings, financial and commercial, so that there might be an accelerated creation of those credits by which debts are ordinarily settled. The banking agreement entered into to lend the City of New York $100,000,000, of which 80 per cent should be forthcoming in gold if necessary, to take up the city's notes maturing abroad in the balance of the year was a big factor in relieving strain in the foreign exchange market and starting a decline in sterling bills.

Whether or not relaxation is maintained or increased will be very largely determined by the response made to the proposition

emanating from the Federal Reserve Board banking conference at Washington a week ago that the banks of the country underwrite a supply of $150,000,000 gold, to be employed to restore the international exchanges to something like normal equilibrium. There is no doubt that an honorable regard for our foreign obligations requires us to use American resources to pay them on the nail. Nor is there any doubt that as we do so the exhibition of American commercial principle will conduce immensely to our benefit and make it all the more probable that in the years ahead the world's financial and commercial leadership will tend to be asserted here. The mere certainty that America is not going to hoard its gold will also militate against foreign demands for the release of any large quantity of it and will induce foreign dispositions to accept American credits in lieu of cash at foreign centres. The matter is of the utmost moment because all our desires for a recovery of trade volumes, domestic and international, and for a maintenance of American values are vain unless there is a warrant of financial provisions to accommodate them.

Another of the great American problems of the day was formally posed at Washington on Wednesday, when representatives of the leading railroad systems in all parts of the country had a conference with President Wilson on the tremendous difficulties in which the war has involved the common carriers. As compared with the danger of a widespread embarrassment of railroad credit because of insufficient earnings to preserve it and to permit the refinancing, if not new financing, which must be done, the troubles of the cotton growers which have occupied so much governmental attention are almost insignificant. Concrete recommendations as to the course which Government, National and State, might pursue toward the railroads in the present emergency were not offered at the conference, but there are various ways in which public support can be given to railroad values and if such support is not afforded disaster unmistakably impends. The circumstances of the railroads must moreover be resolutely dealt with before energies can be directed to the problem of a resumption of regular dealings in the securities markets. Huge potential pressure on the securities markets can be averted if it is demonstrated that railroad credit is not going to be generally impaired and the necessity of resuming business in securities as soon as possible is additional reason for the prompt definition of a public policy of protection for railroad investment.

London	24½	24½	24 15-16	24 15-16	25	25 3-16

COTTON

September 12, 1914.

THE cotton exchanges of the world remain closed, and consequently there is nothing to report of the operations of the cotton trade upon them; and their quotations of the price of cotton are still lacking to the multitude of persons,—producers, manufacturers, dealers in yarn and goods, etc.,—who have been accustomed to rely upon these quotations in the conduct of their several businesses. The distress on this account in various directions becomes more acute with every passing day, and loud demands are beginning to be heard, even from persons previously extreme in their denunciation of these institutions, that they should re-open at once and perform their function. There is, however, small indication that the re-opening will come in the very near future, because too many problems must first be solved in some fashion. The outbreak of the European War caught the members of all the cotton exchanges, at home and abroad, with a large sum of open commitments for customers from one end of the world to the other; many of these commitments were for German or Austrian merchants and manufacturers, who cannot even be heard from, and about whom it is impossible to say whether they are alive or dead. Then the virtual stoppage of international business in cotton goods, owing to the tie-up of exchange and the prohibitive cost of marine insurance, has compelled manufacturers, even in countries not closed by the war, to reduce their operations to the lowest possible point and to buy what small amount of cotton they could spin, from day to day and with no commitments for the future at all. Many of these manufacturers had begun in a small way, before the war broke out, to contract for cotton for delivery next Winter and Spring; and the violent decline in the market has required all the available capital of these manufacturers to protect such contracts, precluding all possibility of their entering into new ones. For the first time in the memory of those now in the cotton trade a great decline in the price of cotton has served to diminish, rather than to increase buying. Consequently, the members of the cotton exchanges, before they can consider re-opening those institutions, must find ways of adjusting and so far as possible liquidating these ante-bellum contracts. This they are making considerable progress in doing, but they are still far from having the slate so clear that they can without assuming undue risks for themselves (and, of course, for their customers through them) open the doors to new trading, with all its uncertainties about the willingness of buyers and the urgencies of sellers. Nor is it, in the long run, for the best interest of the cotton producers that all restraints should be removed from their selling their cotton as and when they like or must. The fact cannot be blinked that at the moment the amount of cotton which the South has to sell from day to day is far greater than spinners are prepared to take. It is true that the holding movement has spread fast and far among the farmers, and that for the time being there is little pressure of cotton offered for sale in the Southern markets. Such campaigns as that known as the "buy-a-bale" campaign are also having their effect. But the time of trial is just ahead of us, not actually here. The ginnings of August and September after all make no very heavy load of cotton. It is when the October and November ginnings, millions upon millions of bales, are upon us that the true test will come of the capacity of the South to hold cotton to a sufficient extent to prevent a severe decline in prices, and a spread of demoralization among those who have carried their cotton home or have "bought a bale." It is true that the promoters of holding cotton are making much of a prognosticated large decrease in next year's acreage in cotton in the United States; but next year is a long time ahead and its possibility of reduced acreage is not the strongest kind of support for a present holder of cotton who sees the market declining to new low levels with each successive week. Then, too, there is the skpeticism, quite as prevalent in the South as elsewhere, as to the possibility of procuring an actual reduction of acreage of more than a trivial amount, when the next crop comes to be planted. The truth is, of course, that the only trustworthy way of maintaining the price of cotton this season at a level that does not mean general ruin through the South, is to give the freest opportunity and the most resolute assistance to the cotton trade, in order that it may use its machinery of the cotton exchanges to spread the unrequired portion of the present crop over a whole series of succeeding years. There are in the world a multitude of spinners and other persons who can be brought by the cotton trade to contract for cotton for delivery in future years. There is no conceivable way in which these spinners can be enabled so to contract except through the use of the system of future contracts made upon cotton exchanges. In 1911-1912, when the surplus of cotton was almost as large as it promises to be this year, the weight of it was distributed over years as far ahead as 1920. The same result could be obtained this year, were it not that the officers of the Government at Washington and Congress itself, instead of calling the cotton trade into co-operation in the remedial measures under discussion, are continually showing both the trade as a whole and the cotton exchanges that their help is not required or desired. Thus all the beneficent activities of the trade and of its instrumentalities are pushed aside, while utterly unsound and in the long run certainly pernicious projects are evolved by political powers that prefer darkness to light. As it is we shall be fortunate if we escape the longest and most costly valorization scheme that has ever been tried by man.

THE CONTRACT MARKETS

THE NEW YORK COTTON EXCHANGE.

The following were the high, low and closing bid prices for each delivery, on Friday, July 31, in cents and hundredths of a cent per pound, gross weight:

The MOVEMENT OF THE AMERICAN CROP.

The American crop year has been changed to run from August 1 to July 31, and all comparisons are made up accordingly.

The following tables, derived from the New York Cotton Exchange, show the movement of the American cotton crop for the past week and since August 1, 1914, with comparisons for previous years:

CROP MOVEMENT INTO SIGHT.

Weekly Movement.	1911-12.	1912-13.	1913-14.	1914-15.
Port receipts	233,944	197,445	217,790	49,113
Overland to mills and Canada	1,405	1,761	2,505	1,316
So. mill takings, est., exclusive of takings from Southern ports.	40,000	40,000	40,000	15,000
Gain of stocks at interior towns	27,353	20,758	32,033	22,141
Brought into sight for week	302,702	259,964	292,328	87,570
Total Movement—				
Port receipts	704,543	550,903	624,307	121,770
Overland to mills and Canada	11,498	13,781	21,753	5,451
Southern mill takings	127,032	100,873	139,796	23,000
Stocks at interior towns in excess of July 31	53,203	38,622	9,896	22,141
Brought into sight thus far this season	896,276	704,211	795,752	172,362

The total crop movement is respectively for 46 days, 44 days, 43 days and 42 days.

NEW YORK COTTON EXCHANGE REVISION OF DIFFERENCES FOR THE GRADES OF COTTON.

At a meeting of the Committee on Revision of Quotations of Spot Cotton, held on Wednesday, September 9, the differences, or valuations for delivery purposes, of the grades of cotton other than Middling, were considerably reduced for the grades above Middling, but left unchanged for the grades having a lower value than Middling. The following table gives the revised differences, the old differences, and the number of bales of the several grades in the New York stock on September 8:

Bales in N. Y. Stock.	Grade.	Old Differences. Cents.	Revised Differences. Cents.
.....	Fair	1.75 on	.70 on
5	Strict middling fair	1.50 on	.63 on
16	Middling fair	1.30 on	.56 on
5	Strict good middling	.90 on	.42 on
1	Fully good middling	.78 on	.35 on
1	Good middling	.65 on	.28 on
8	Barely good middling	.48 on	.21 on
146	Strict middling	.32 on	.14 on
201	Fully middling	.16 on	.07 on
1,057	Middling	Basis	Basis

UNITED STATES CENSUS BUREAU'S ESTIMATE OF THE WORLD'S PRODUCTION OF COTTON IN 1913.

The Bureau of the Census has just issued the results of its annual inquiry as to the amount of cotton produced in all the cotton-producing countries of the world for the crop year 1913,—the same furnishing the supply of cotton for the statistical season of 1913-1914. It should be borne in mind that the figures for the various countries are not estimates of the Census Bureau itself, but are based upon the best estimates obtainable from governmental reports (including United States Consular Reports), statistics gathered by associations and individuals conversant with the subject, trade journals, etc. According to the statement of the Bureau of the Census accompanying the statistics: "The statistics for the United States were collected by this Bureau. Those for other countries have been compiled from a number of sources, among them being: 'The Cotton Gazette,' Liverpool; Mitsui and Company, Osaka; Reinhart and Company, Alexandria; Commercial Intelligence Department of the Indian Government; Russian Department of Agriculture; E. T. Craig (Mexico City); Pan American Union; and the United States Consular Reports."

The following table gives the statistics of the Bureau of the Census, by countries and in total, for the crop year 1913, with comparisons for the four previous years:

COTTON PRODUCTION OF THE WORLD FOR CROP-YEAR 1913.
(In bales of 500 pounds, net weight.)

Country.	1913.	1912.	1911.	1910.	1909.
United States	13,545,000	13,113,000	15,013,000	11,104,000	9,566,000
India	3,801,000	3,328,000	2,270,000	2,722,000	3,414,000
Egypt	1,470,000	1,432,000	1,463,000	1,506,000	1,000,000
China	1,200,000	1,074,000	625,000	775,000	600,000
Russia	1,004,000	917,000	939,000	981,000	785,000
Brazil	420,000	315,000	275,000	280,000	225,000
Mexico	150,000	140,000	130,000	147,000	125,000
Peru	110,000	110,000	100,000	95,000	107,000
Persia	140,000	137,000	120,000	117,000	116,000
Turkey	130,000	115,000	124,000	105,000	108,000
All other countries	285,000	235,000	210,000	195,000	195,000
Totals	22,255,000	20,976,000	21,269,000	18,027,000	16,241,000

The amounts for India do not include cotton used in home manufacture, although such cotton is included in the reports of cotton produced, compiled by the Indian Government.

(For Further Items on Cotton See Page 352.)

NEW YORK QUOTATIONS FOR STANDARD COTTON GOODS AND YARNS

The following are quoted prices in the New York market for typical standard cotton goods (in cents per yard) and cotton yarns (in cents per pound) on Saturday of last week and on Wednesday of the present week:

Cloths.	Saturday.	Wednesday.
Print cloths, 28 in. 64 x 64s	3⅜	3⅜

Cottonseed Products in India.—Considerable attention has recently been given in India to the possibility of further developing the cottonseed oil industry, writes Consul General James A. Smith, of Calcutta. India, as is well known, is the largest cotton growing country after the United States. The average area sown with cotton for the three fiscal years ending March 31, 1913, was slightly over 22,040,000 acres, and the average annual output 3,845,333 bales of 400 pounds each. Indian cotton yields about 30 per cent lint and 70 per cent seed. On this basis the average stock of ginned cottonseed in India during the three years mentioned was about 1,602,000 gross tons. About 138,000 tons are said to be required for sowing purposes, and the remainder, 1,464,000 tons, is available for crushing, export, cattle feed, etc. Exports of seed show an average for these years of about 633,000 tons, leaving a balance of 831,000 tons, which at present is largely used as cattle feed, a comparatively small portion being pressed for the oil or used as manure. Being mainly fed to cattle the unassimilable excess of oil in the seed is wasted. It is clear, therefore, that only a small portion of the seed is profitably utilized. At present it is said that there are only five mills in India that are understood to be crushing cotton seed. Statistics as to the production of oil are not available, but apparently the quantity is not so large as the available seed remaining in the country and unprofitably utilized in other ways would appear to warrant.

The Cotton-Mill Situation in France.—French cotton textile industry (7,400,000 spindles) is chiefly located in Vosges districts around Lille, says a cablegram from Consul General A. M. Thackara, at Paris, and, to a smaller extent, in Normandy. Vosges factories have already largely ceased working; Epinal stopped immediately; similar action in other large fortified cotton manufacturing cities. Work in non-fortified towns and villages is seriously affected for Vosges and Eastern France; only 25 per cent of spindles running. Further decrease is probable and resumption of work is doubtful until after declaration of peace.

Most Roubaix district mills are running half, owing to lack of workmen, raw materials and money. Output is already less than half, with prospect during the war of quarter normal production resuming. French cotton textile production is now 25 to 35 per cent capacity, with prospects of further reduction and complete stoppage if war is prolonged.

[One-fifth of the French spindleage is normally employed on Egyptian cotton, and the balance on American cotton. French mills used 1,025,000 bales of cotton during the cotton year ended August 31, 1914.]

WE suppose that, had it not been for the intense preoccupation of the public mind with the daily chronicle of the vicissitudes of the European War, much more attention would have been given, both by the press and by people in general, to the extraordinary service which has been rendered to the City of New York by Messrs. J. P. Morgan and Company, Messrs. Kuhn, Loeb and Company, and the other New York bankers whom these great banking firms have allied with themselves in caring for the City's maturing obligations of over $80,000,000, in London and Paris. The lessons to be learned from the operation, both in itself and in respect of the causes that made it necessary, are highly instructive, not only for the citizens of New York City, but also for those of the whole country. Particularly should they be pondered by those public officials and chosen representatives of the community whose duty it is to devise and to carry through the sound and provident financing of the greater municipalities of the United States. For many years past the City of New York has been what may be called one of the pests and plagues of the financial markets of the world, and of late years it has come to be at times a real menace to all the larger financial interests of the country. Growing greater and richer every year; confident in its ability to meet any charges it might see fit to incur; eager for the immediate possession not only of necessary public improvements, but also of a multitude of civic embellishments, conveniences and provisions for the health and comfort of its citizens; heedless about accumulating debt; until recently governed by officials who for the most part were utterly incompetent as business men, the City of New York has managed to run up a debt which is greater than that of most of the nations of the earth and indeed vies with that of the United States as a whole. Not only is this so, but the City has pursued no consistent policy either with the creation of its debt or with the placing of it in such wise as to make it advantageous to administer and to provide for. Politics, in the sense of a care for what will immediately strike the mass of citizens as flattering to their prejudices, rather than steadfast holding to the ultimate good of the mass of citizens, has characterized the arrangements which the City's governors and officers have made when obtaining the money required or desired. Superficially clever, instead of permanently reliable, methods of floating loans have been too often preferred. There has been little consideration given to the effects upon the whole fabric of our internal and external finances resulting from the manner in which the huge offerings of the City's securities were made or the provisions for payment of interest and the repayment of principal were arranged. When the popular hue and cry has been directed against our own bankers, on the ground that they get too much for their services, the City's financial managers have thought it a mark of political shrewdness on their part to pass our local bankers by, and of their own initiative to deal direct with bankers in the financial centres abroad, unregardful of the fact that they were thus making it impossible for our local bankers to co-ordinate the international indebtedness thus created with the general mass of the international obligations, debit and credit, public and private, of New York and of the country as a whole.

A result of all this has been that for the past generation a regular accompaniment of every financial crisis or panic in the United States, or in the world at large, has been that the City of New York suddenly appears on the scene with a great mass of maturing obligations, chiefly international, which somehow must be met, which the City's officials have made no real preparation to meet, which they have no proper machinery for meeting, owing to the sporadic and experimental character of their engagement, and which the bankers of the City are called upon to take care of somehow, lest the City's credit be ruined, a wide disturbance created, and a worse thing happen. This was the case in the height of the panic of 1907; and now again, in the midst of the confusions of this year of fate for the great nations of Europe, the same situation is found. New York is found to have floated in London and Paris, chiefly through bankers who owe no permanent duty to the City in bad times as well as good, a staggering mass of obligations, saving thereby perhaps a small amount in the way of bankers' commissions and perhaps also having shaved down a little the rate of interest paid; but when the maturity of the obligations approaches and something must be done about meeting them, lest everybody suffer, it is discovered that for the sake of the actually insignificant, though politically useful, savings just mentioned, financial prudence and foresight have been completely neglected, and that the bankers who had been given to understand that New York City can look out for itself must manage somehow to take the payment of these obligations in charge, provide the funds wherewith to meet them and strain their own resources and those of the community, not of New York but of the whole country, in order that the credit of New York and all the interests that would be unfavorably affected by an impairment of the credit of New York, may be saved from the consequences of the incompetence and improvidence of those to whose hands the government of New York has been entrusted by its citizens.

After criticism so severe as we have just felt obliged to

use in regard to the general civic unthrift and slovenliness, —not to say indifference to consequences, provided a political end was gained,—which had brought the City of New York to the pass of being the greatest single disturbing element in a financial situation more strained than any living man has ever seen, it is only fair to say that within the past few years very great advances have been made in the direction of a more orderly and a more provident conduct of the City's financial affairs. A decade ago it was literally true that no living person could approximate to the City's true financial situation within millions and even tens of millions of dollars. Money was borrowed, money was spent; taxes were levied and applied to the payment of civic expenses or to maturing obligations or to whatever use seemed most pressing; floating indebtedness accumulated here, there and everywhere. When the situation grew too difficult to cope with, more money was borrowed. Today, this is all in large part changed. The introduction of a sound accounting system and of the annual budget, in place of a system of disjointed and uncorrelated appropriations, has at last given the City's authorities knowledge and control of its internal financial affairs. The credit for this is largely due to the very men who now constitute the Board of Estimate and who have had to deal with the inexcusable present embarrassment in which the City has found itself. They have done much and they are entitled to due credit for it, both from the citizens of New York and from the holders of the City's obligations.

But it was to the bankers they had to turn to help them out of the predicament in which they found themselves by reason of the nearly a hundred millions of obligations maturing abroad and calling for payment, no matter what the international financial situation might be. The issue of these obligations had been made with the idea that there are never times of trouble, that the foreign exchange market is always open to everybody, and particularly to so great a customer as New York City, that sums of a hundred millions can be dealt with freely at all times between New York and London or Paris, that bankers and their machinery are of secondary importance and may be used as mere conveniences,—in short, that experts and masters of one of the greatest departments of human affairs can easily be superseded by amateurs, provided only the latter have in their hands business enough to make their custom desirable.

As in 1907, the great New York bankers have postponed attention to their own troubled international affairs, in order to help the City of New York out of the embarrassments into which its own financial authorities had brought it. At a time when the whole world is clamoring for the liquidation or reduction of outstanding obligations, and when both industry and commerce are held in shackles, as it were, until this process can be accomplished to the point of safety, the City of New York has been tided over its crisis, one hundred million dollars have been found for it, its foreign obligations have been cared for. The vast risks involved in the operation have been assumed by men whose burden was already almost greater than human flesh can endure, and who realize perfectly that their main business as servants of the country is not to see that the credit of New York City is maintained, but to set in motion the streams of commerce, domestic and foreign, to provide for the needs of industry, and to bring about a sufficient activity to enable the country's population to earn wages upon which to live. It is true that, as things now are, a collapse of the credit of New York City would have far-reaching consequences as regards all the outstanding credits of the country, and that for this reason a technical advantage was given to the financial officers of the City. No doubt, the bankers took this into consideration, when they assumed the at first sight insoluble problem of doing for New York City that which they would never have dared to undertake for themselves. There is, none the less, only one phrase to describe the venture and its outcome,—it was a magnificent achievement.

We have little doubt that in the years of peace to come there will be found those who, for political or other effect, will again raise the cry that in their dealings with New York City, the bankers charge exorbitantly for their services and that the present operation is a glaring example of this. The City, for the first time since shortly after the Civil War, has had to pay 6 per cent for the money it had to have, and it has also had to agree to rates of exchange of $5.035 for each pound sterling and 20 cents for each franc, remitted to London and Paris for the discharge of the 80 millions of the City's obligations maturing in those markets. If the bankers make a profit out of the exchange operations, they are to retain it, but not beyond 2 per cent of the $80,243,040.47 required to be remitted. These are high prices, both for interest and for exchange; but, on the one hand, the conditions of the market warrant them, and, on the other, those who are called upon to repair the mistakes of amateurs and incompetents are entitled to almost and charge they may make, especially when the risks involved are so huge.

It is well that the City of New York should have this bitter lesson and should learn by experience how expensive a policy it is in the long run to leave aside those who know their business and who have the machinery of their business all in their own hands. In the end the experts must be resorted to and their services must be had at a price commensurate with the service which they, and they alone, can render. And perhaps this is not an unfitting place to say that these troublous times appear not unlikely to bring the masters of finance, industry and commerce into their own again. For some years past they have been held up to the hate or scorn of the public, and every politician has thought his best political capital was to be found in attacking them. Unfortunately for the politicians, they and they alone know their business. In days of peace and confidence it is easy to get a hearing for the doctrine that they are getting too high a remuneration for what they do, and that society can do it all for itself and save its money. But peace and confidence, unhappily, are not uninterrupted in this world we live in. War and battles come. Then people begin to think of the masters of finance and industry in some such terms as the Greek historian, Xenophon, used in describing the Lacedemonian general, Clearchus: "In time of peace no soldier would willingly serve under Clearchus, for he was stern, rough of voice, harsh of countenance. But when the battle was raging, every soldier sought to get under the command of Clearchus; for then his stern way, his rough voice and the harshness of his countenance seemed to have something saving in them."

Arthur Richmond Marsh

THE PRINCIPLES UNDERLYING THE REVIVAL OF THE AMERICAN MERCHANT MARINE

THERE is one perennially interesting American controversy which seems almost never to be regarded from an economic viewpoint. We refer to the merchant marine of the United States. To such an extent is this the case that the average American to-day finds it hard, even if he desires so to do, to think in economic terms about the subject himself or to remember hearing or seeing any economic discussion of it. The phrases that rise to one's mind in connection with it are vague and indeterminate, even though appealing, like "Trade follows the flag," or "The Sea Power in History," and the like. Politicians find it convenient to draw distressing parallels between the former greatness of the American mercantile marine and its present decadence; and these parallels stir (and are intended to stir) patriotic emotions, but certainly not economic analysis, or cool calculation of a business kind. Hence even thoughtful persons, whose inclination is to give really serious consideration to the problems that concern them, often fail to arrive at clear conceptions of this particular problem. Illustrations of this are all too numerous. Thus the Treasurer of the United States Merchant Marine Association, an organization formed "to educate the public on the need of a merchant marine," is quoted as follows in a recent morning paper:

"The granting of a direct subsidy to shipping is distasteful to me. What we will eventually advocate after the public has been fully acquainted with shipping conditions of the merchant marine of this country is doubtful. We have not given consideration to this subject. We will lend all our efforts to secure conditions that will tend to aid in the growth of our shipping."

Thus, also, "The Outlook" falls short of any definite suggestions. It states editorially:

"Above all, what is needed is the formulation of a definite policy which the United States can follow in the building up of its merchant marine, so that this Nation will not again find itself in its present predicament of dependency upon belligerent nations for transportation of passengers and goods across the seas."

It is especially unfortunate that a subject which many people believe to be of so great moment in our national development should not be more exactly stated in concrete terms, so that it can really be reasoned about. It may be profitable, therefore, at a time when the Government's proposal to enter the foreign carrying trade has brought the question into fresh prominence, to examine the causes underlying the rise and the decline of our foreign shipping. Thus we may be able to determine whether the conditions underlying the decline have been removed, and to conclude whether a healthy revival of our merchant marine is possible, with or without the interposition of the Government.

In the first place let us see exactly what the facts of the matter are. It appears from the reports of the Commissioner of Navigation that in 1913 the total tonnage of sailing and steam vessels in the United States was 7,886,551. The tonnage of United States vessels engaged in foreign trade was, in the same year, 1,019,165. This was 9.1 per cent of our total foreign trade conducted in vessels. In 1859 the proportion in American-owned ships was 66.9 per cent. It appears, then, that we have a healthy coastwise carrying trade of 6,817,013 tons, which is increasing annually. And we find that Congress has restricted our coastwise enrollment to American vessels. A corresponding aid to our vessels engaged in foreign trade would take the form of a subsidy, as it would be economically impossible to restrict our foreign shipping wholly to American vessels. In the present tariff act an attempt was made to refund 5 per cent of the duties on goods carried in American bottoms; but it was found necessary to abandon this because it infringed our commercial treaty obligations. Are there sound reasons in favor of granting Government aid to our overseas shipping?

In the Colonial era our merchant marine was a thriving industry. The early settlers found a wealth of timber ready to their hands. Between 1700 and 1750 ship-timber was one of the chief articles of export. In the construction of ships a high degree of skill was developed, and the American ships built up to the time of the Civil War were a just source of pride to the country. The maximum was reached in the decade ending in 1861 when 3,600,748 tons were constructed in American yards, an average of 360,000 a year. By 1880 this had declined to approximately 100,000. The average tonnage built in the United States during the ten years ended with 1913 was 366,000; but this includes canal boats and barges, and the increasing number of enrolled vessels already referred to which are engaged in our protected coastwise trade. Our present concern is with vessels engaged in foreign trade, in which there has been a great decline in numbers. From 66.9 per cent in 1859 the proportion of our trade carried in American vessels declined to 39.2 per cent in 1867; 25.7 per cent in 1873; 17.6 per cent in 1879; 9.4 per cent in 1890, and in 1898 to 5.9 per cent, the lowest point reached.

The success of the American shipping in all its branches up to the time of the Civil War no doubt stands out in sharp contrast to the present status. And it affords splendid opportunities, which have been generously seized for works which are more exhortative than analytical. And it is not our purpose to criticise a writer for praising his country's past. There is so much being written, however, like the following that we quote it as typical:

"The present exclusion of America from the deep sea is only for a time, and now only for a brief time. No race like ours, with a grasp upon two oceans and the mingled blood of Viking and pioneer can long be cheated of its birthright."

The point we feel it important to emphasize is at once suggested by this quotation, namely, that the active cause of the early strength of our merchant marine was not the "mingled blood of Viking and pioneer," but the high return which capital in those days could obtain in maritime industries. We are not insensible to the thrill which is carried in the story of our early packets and clippers, our East Indiamen or our New Bedford whalers; but we are constrained to stress the point that the hardy merchants and mariners of those days were in business because it was economically profitable for them. It will be interesting to substantiate this often-neglected fact by examination of the entertaining book from which we quoted above, "The American Merchant Marine," by Mr. W. L. Marvin.

Considering first the whale fisheries, Mr. Marvin says, "nowhere except in gold or diamond mining could so much money be so readily made as by fortunate ships like the 'Uncas' of Falmouth, which arrived in 1831 from a voyage of two years and eight months with 3,468 pounds of sperm oil, valued at $88,000, or the 'Loper' of Nantucket, which took a $50,000 catch in fourteen months." He goes on to instance typical cases of successful voyages: the "Gen. Pike" and the "Adeline" of New Bedford, made a profit of $5,000 each on a single day's catch; in 1849, the "South America," of Providence, representing an investment of $40,000, returned from a two years' voyage with a cargo which netted $89,000; and the "Coral" of New Bedford, in a three years' voyage, brought home oil which sold for $126,000.

The same high profits attended the ventures of successful merchantmen. Mr. Marvin cites the case of Capt. Richard Cleveland, an ancester of Grover Cleveland. After several sailing exploits he

purchased a small vessel in Europe and set out to barter and exchange in the principal ports of the world. He returned at length to his home: "He had started with a capital of $2,000, and now came back to Salem with $70,000, a thirty-five-fold increase in seven years. Seventy thousand dollars was then (1804) a fortune, when a Salem merchant who had accumulated a million was reckoned the richest man in the United States."

Having thus indicated that our early merchant marine, like all commerce, was primarily conducted for profit, we are now prepared to examine the causes which rendered the pursuit unprofitable, and thus contributed to its decline. These may be grouped under six heads. It may be said of the whaling industry that two special causes, the discovery of petroleum, and the increasing scarcity of whales, contributes to its decline; but in general its falling off was parallel with that of the merchant marine as a whole, and largely due to the same causes.

(1) Change from Wooden to Iron Ships.

About the middle of the last century iron began to be substituted for wood in ship-construction. England had from the outset made much better progress than the United States in the iron industry, until in 1870 the proportion of iron construction to total tonnage in this country was 3 per cent, while in England no less than 82 per cent of the tonnage built in that year was of iron. Of course one reason for the development of this severe handicap was the inopportune disturbance of our commerce by war.

(2) The Outbreak of the Civil War.

From 1861 to 1864 a severe check was administered to the building of ships, heavy taxes were imposed upon the existing tonnage, and privateers, in many cases built in England, menaced our commerce.

(3) The Withdrawal of Subsidies.

This had been further hastened by the withdrawal of Federal aid in 1858. In the ten-year period between 1847 and 1857 the Government had paid out about fourteen and a half million dollars in ship subsidies.

(4) Granting of Subsidies by Other Nations.

After the war the taxes were not speedily removed; only small subsidies were granted, and those were soon withdrawn; while England, France, Germany and Japan aided their merchant fleets with varying but substantial sums.

(5) Turning of Capital to Industry and Internal Development.

At the same time capital was enabled, behind a heavy tariff protection, to find excellent employment in industry on land; and the opening of mills and factories gave occupation to a million soldiers whose employment had presented, in prospect, a most serious problem.

(6) Best Laborers Diverted to the West.

Finally, the unifying of the nation and the opening of the West induced many of the type of men who had formally followed the sea, or engaged in ship-building, to occupy the fertile tracts where grain and cattle could be raised with gratifying profit. The cost of labor rose; and thus was presented a fundamental economic problem which has ever since stood in the way of any profitable continuance of the ancient industry in which we once excelled.

It seems only fair to conclude from this survey that the American people should be absolved from the implication that the decline of their merchant marine has been due to a weakening of their sinews or a lessening of their love of country. Even Mr. Marvin, whom we quoted above, and who is in his attitude toward this subject notably *laudator temporis acti*, is constrained to say, "National aid to shipping is potent, but it is not omnipotent. If it had not been withdrawn in 1858 by what was virtually a political crime, we should have saved our fine steam fleet on the North Atlantic even through the storm of the Civil War. If, however, a subsidy policy had been re-established in 1868 or 1870, after the lapse of a decade, it would undoubtedly have disappointed its sanguine champions, for the other essential factors in the problem were not favorable. It was (in 1870 and onward) an era of railroad building and not of shipbuilding. The energies and the money of the nation were absorbed by the urgent demands of home development. * * * No national legislation, however liberal or however strenuous, could have caused American shipping to spread or increase between 1865 and 1890."

Assuming that this is true, are the inducements for capital in the construction and maintenance of a merchant marine greater at the present time? If they are greater, are they enough greater to enable the industry to thrive without government aid? And if government aid is afforded, will it ensue a healthy marine industry now, when it admitetdly would not have done so in 1880? To get a firmer basis from which to regard these questions it will be necessary first, to examine briefly the course of government aid to our shipping in the past. The matter of mail subventions prior to 1858 has been touched upon. Congress has given further aid by restricting American registry to vessels built within the United States; restricting coastwise and domestic commerce to American vessels; permitting the importation free of duty of foreign materials when for use in the construction of vessels sold to foreigners, or for the repair of such vessels. Further favor is afforded by a lower tonnage tax upon voyages to North American ports, and by the expenditure of over $5,000,000 annually by the Government in lighthouse maintenance, a charge which is imposed upon the shipping itself in Great Britain. Finally the Government pays for the transportation of foreign mails in American ships a higher rate than foreign vessels would demand.

Thus it will be seen that there has been, in this country, no fixed principle against assisting our shipping. Here again the economic test makes itself felt. The Government aid has not been sufficient to offset the greater cost of the industry in this country than abroad. Any subsidy, to produce the desired result, must make up this difference.

In 1904, Mr. P. A. S. Franklin, vice-president of the International Mercantile Marine, estimated that an American-built ship cost 40 per cent more than a British-built ship. The two items chiefly involved in making such an estimate are cost of material and cost of labor. The material cost is not intrinsically much higher with us, but owing to the large orders obtained by British companies, much better rates are made possible; and many economies result through the regularity of employment and concentration of effort incident to the construction of several ships at a time in the same shipyard.

In this department of industry it is probable that Americans could very rapidly develop systems of work and mechanical devices not surpassed by any in the world. It is not unfair to say that they have shown native genius for labor-saving organization. Then, too, the natural conditions are favorable here for shipbuilding. There are many splendid inland bays, located near the material producing centres. And the primary need, capital, is, at least theoretically, now to be released into new fields by the lowering of the tariff wall, by the gradual completion of the railroad systems of the country, by the fuller development of the West and of the great industrial plants throughout the country.

But the most troublesome question of labor cost still remains; and it remains as an impassible barrier to a natural revival of marine construction and operation. Wages in American shipyards are from 50 to 100 per cent above wages for similar labor in Europe. The same is true of wages of ships' officers and seamen.

It is a mistake to attribute the trouble to our better laws for the care of seamen. They appear to us to be a source of pride; and they are no new product of labor union agitation. The first act to protect seamen's interest was passed in 1790. If we regard the problem purely as an economic one we are forced to conclude that we shall have no merchant marine until the American laborer can earn as a sailor at least as much as he can earn making the best shoes in the world in Massachusetts, or raising cotton in Georgia, or wheat in Iowa.

We might thus conclude our discussion were it not for the repeated statement that we ought not to rest here, even though our economic case is clear. We are told that our national defense requires a large fleet of convertible merchant cruisers, and that our navy in time of war must rely upon a naval reserve which receives its training in the peaceful pursuits of commercial navigation. We are reminded that in 1898 at the recruiting station in Gloucester, Mass., 76.5 per cent of the men examined were accepted, while in Boston only 14.5 per cent and in New York 6 per cent of those who applied were found fit. We are here confronted with a question not of economics but of national defense, and it would require a wholly different line of investigation to enable us to pass upon the question as to whether Congress should subsidize an industry which cannot stand alone in order better to prepare us for war. It is pertinent, however, to quote an expert on the subject. We take the following from Admiral Mahan's "The Influence of Sea-Power Upon History," p. 48: "If time be, as is everywhere admitted, a supreme factor in war, it behooves countries whose genius is essentially not military, whose people, like all free people, object to paying for large military establishments, to see to it that they are at least strong enough to gain the time necessary to turn the spirit and capacity of their subjects into the new activities which war calls for. If the existing force by land or sea is strong enough so to hold out, even though at a disadvantage, the country may rely upon its natural resources and strength coming into play for whatever they are worth,—its numbers, its wealth, its capacities of every kind. If, on the other hand, what force it has can be overthrown and crushed quickly, the most magnificent possibilities of natural power will not save it from humiliating conditions, nor, if its foe be wise, from guarantees which will postpone revenge to a distant future. The story is constantly repeated on the smaller fields of war: 'If so-and-so can hold out a little longer, this can be saved, or that can be done'; as in sickness it is often said: 'If the patient can only hold out so long, the strength of his constitution may pull him through.' * * * The United States has not that shield of defensive power behind which time can be gained to develop its reserve strength. As for a seafaring population adequate to her possible needs where is it? * * * It may be admitted that a great population following callings related to the sea is, now as formerly, a great element of sea-power; that the United States is deficient in that element; and that its foundations can be laid only in a large commerce under her own flag."

Here then is set forth a reason for the establishment of a merchant marine. We should naturally expect the author to advocate a subsidy for that purpose. But, on the contrary, Admiral Mahan seems to suggest that although a naval organization demands a merchant marine as its basis, yet only a healthy and self-reliant merchant marine will serve the purpose; and a healthy merchant marine is one that grows up through private enterprise, and upon a paying basis. In closing we may well quote from the same volume, at page 39: "Interest in the sea and an intelligent appreciation of the part it played in the public welfare were (in Colonial days) easily and widely spread; and a motive more influential than care for the public interest was also active, for the abundance of ship-building materials and a relative fewness of other investments made shipping a profitable private interest. How changed the present condition is, all know. The centre of power is no longer on the seaboard. * * * When the day comes when shipping again pays, when the three sea frontiers find that they are not only militarily weak, but poorer for lack of national shipping, their united efforts may avail to lay again the foundations of our sea power."

THE PROBABILITY OF INCREASED IMMIGRATION AFTER THE CLOSE OF THE EUROPEAN WAR

OF vital importance from an economic point of view to the future of the United States is the possibility of greatly increased immigration from Europe upon the conclusion of the present war. It is clear that the destruction of crops, the stoppage of industry, and the large war expenditure incident to the struggle will for a time impoverish the belligerent nations. Before prosperity can revive it will be necessary for the defeated countries to pay off the indemnities which will doubtless be imposed upon them. Large sums of money will be required at once by both victors and vanquished to repair the devastation of war, and to lay the foundations for the revival of commerce. These financial burdens must fall in the last instance upon the great body of the people in the form of taxation. And it is not unreasonable to predict as a consequence, that large numbers of them will turn their eyes to the United States as the land where millions of their countrymen have already found homes, and even more now as the one great nation not in fundamentally straightened circumstances owing to participation in the European War.

It is interesting to observe that the emigration from Germany in 1872 and 1873 was greater, relatively to population, than ever before or since. The figures for 1869 are 70,000; for 1872, 154,000, and for 1873, 134,000. This emigration, however, appears not to have had this country as its objective.

The immigration figures in the statistical abstract of the United States would seem to indicate that in Germany the full effects of the war of 1870 did not make themselves felt until some time after the conclusion of peace. In France the conditions at home seem progressively to have discouraged emigration.

IMMIGRATION INTO THE UNITED STATES OF FRENCH AND GERMANS, BY TEN-YEAR PERIODS.

	Jan. 1, 1861 to June 30, 1870.	Years Ending June 30— 1871-1880.	1881-1890.	1901-1910.
France	35,984	72,206	50,464	73,379
Germany	787,468	718,182	1,452,970	341,498

During the last five years the immigration from the countries now at war has been as follows:

IMMIGRATION FROM BELLIGERENT NATIONS, 1908-1913.

	1909.	1910.	1911.	1912.	1913.
British Isles	71,826	98,796	102,496	83,027	88,204
Russia	120,460	186,792	158,721	162,395	291,040
France	6,672	7,383	8,022	8,628	9,675
Belgium	3,692	5,402	5,711	4,169	7,405
Austria-Hungary	170,191	258,737	159,057	178,882	254,825
Germany	25,540	31,283	32,061	27,788	34,329

The total immigration into the United States from these six nations during 1913 was 685,478, out of a total immigration from Europe during that year of 1,055,855. Our total number of immigrants from all parts of the world during 1913 was 1,197,892.

It will thus be seen how large a portion of our immigrant supply is likely to be affected by the war. Indeed, if we consider Italy as within the possible sphere of influence we include the major portion of the total European influx. The immigration from Italy during 1913 was 265,542, making, with the immigration from

the six belligerent countries, a total of 951,020 out of 1,055,855 from all parts of Europe during that year.

The actual increase in the number of immigrants following the conclusion of peace must, of course, be a matter of pure conjecture. It should be observed that, on the one hand, several factors may have considerable bearing in offsetting the theory that the exodus from Europe will be heavy. For instance, it is well known that systematic efforts have been made in recent years in Germany to keep the people at home. It is not impossible that added efforts will be made after the war, owing both to the severe losses in battle, and to the need of laborers to support the unusual activity which for a time characterizes the industry of a nation recovering from the effects of war. Then again, it is not impossible that the new Russian attitude toward the Jews may have considerable bearing on what was last year our largest source of supply.

On the other hand, it is well known that the scale of wages in this country, and the demand for labor in times of great industrial activity are potent factors in determining the volume of immigration. Italians notably cross and recross the ocean, acting in a measure as a barometer of labor conditions. It is probable that the close of the war will see a period of very great activity on the part of our industries to supply the nations which have been depleted by the conflict. The result of this, of course, would be a largely augmented immigration.

There is another point to be considered which bears on the resultant of our annual movement of immigration and emigration. The number of emigrants who leave the United States for Europe now averages about 350,000 a year It is highly probable that this movement will largely cease for a number of years, thus augmenting by over a third of a million our annual increase in population.

One observation which may not be untimely, on the basis of these figures, is that in view of the possibilities of a largely increased exodus from Europe at the close of the war, the present time is a critical one for consideration by Congress of measures restrictive of immigration, if such measures are to be taken at all. The flow of immigrants is at present at low water-mark, only 71,728 having entered the country in June, 1914, as against 176,261 in June, 1913, and 34, 637 in July, 1914, as against 138,244 in July, 1913.

It may further be remarked that now is the time for the various societies devoted to the distribution of immigrants, and the organizations working for the relief of congestion in our cities, to consider the greatly increased difficulties with which they may be confronted in the not far-distant future.

WHAT ENGLAND BELIEVES SHE IS FIGHTING FOR IN THE PRESENT EUROPEAN WAR

IN deciding upon the taking of her present part in the great struggle in Europe, England has given many evidences, both through the utterances of her governing statesmen and through those of the more popular organs of her public opinion, that she has deliberately and, perhaps we may say, solemnly put her hand to the plough and means to plough the furrow through. There is the note of the same tenacious and unwavering purpose which characterized England's relentless and finally successful contest against Napoleon. There is small risk in prophesying that she cannot now be seduced or turned from her fixed aim by any fair-seeming promises or flattering offers that may be made to her by the German Emperor, any more than she could be changed from her course by the successive seductive proffers made to her by the Emperor of the French a century ago. Then she took for her motto, not the exact words of Cato the Elder, *Delenda est Carthago;* but a close adaptation of them, *Delendus est Imperator.* And that is beyond a doubt her firmly conceived intention to-day.

In the Boer War, distressing as that proved to Great Britain, there was no such deep-set purpose. That, at the start, was unquestionably looked upon as chiefly a matter of mere police-work, though, of course, something of the grandiose dreams of Cecil Rhodes may have affected English statesmen and people. That task, at any rate, was at the start thought of as easy, and it was only the development of events that brought out its serious significance. At no time, moreover, did the Boer War raise in the slightest degree the question of England's very existence, or of her continuance as one of the great nations of the earth. No deep determination on England's part to give all and suffer all for a vital principle was ever involved in the Boer War. But in entering upon the present war, England has had to face from the outset the possibility of total defeat and of the loss for all calculable time of the great prestige which she has enjoyed for centuries as a nation, as the mistress of the seas, as the leader of the world in finance, in industry and in commerce, and, above all, as the one great exemplar (except, perhaps, the United States) of orderly freedom, self-originated and self-directed, together with all the common goods that flow from such freedom. To risk all this in the present war in Europe can have meant only that England, whether of high or low degree, had come to a certain conclusion about a matter of vital importance to her very life and had determined that it was better to lose everything rather than to have triumph a principle fundamentally hostile to all she stood for.

There have, of course, been many expressions of many men and many journals in England that open to us intimations of the deeper thought and feeling of the country with regard to the dangerous and grievous course upon which it has been decided to enter,—a course, which, as has been said above, England may now be expected to follow as utterly to its end as she followed her determination about the great Napoleon. The celebrated "White Paper," recently made public, as well as the earlier nobly reserved statements of Sir Edward Grey and Mr. Asquith in the House of Commons revealed much, in spite of their dealing with specific matters, rather than with general principles. In respect of the latter, however, there has perhaps nowhere appeared a statement going more directly to the root of the matter than is to be found in an interview given a week ago by Winston Churchill, First Ford of the Admiralty, to Mr. William G. Shepperd, a staff corerspondent of the United Press, and published in the New York "Evening Sun" of August 29. Said Mr. Winston Churchill in this interview:

"In a word, it is the old struggle of a hundred years ago against Napoleon. The grouping of forces is different; the circumstances are different; the occasion is different; the man, above all, is different—happily. But the issue is the same. We are at grips with Prussian militarism. England stands right in the path of this ever-growing power."

The question of the lightening of the grievous burden of armaments and military preparation upon the populations of the nations of Europe, said Mr. Churchill, is to be determined by the result of this war.

"If we succeed and if, as a result of our victory, Europe is rearranged as far as possible with regard to the principle of nationality and in accordance with the wishes of the peoples who dwell in the various disputed areas, we may look forward with hope to a great relaxation and easement. But if Germany wins, it will not be a victory of the quiet, sober commercial elements in Germany nor of the common people of Germany, with all their virtues, but the victory of the blood and iron military school whose doctrines and

principles will then have received a supreme and terrible vindication."

"I canont understand why Germany has not been contented with her wonderful progress since the battle of Waterloo. For the last half century she has been the centre of Europe; courted by many, feared by many, treated with deference by all. No country has had such a reign of prosperity and splendor. Yet all the time she has been discontented; solicitous of admiration, careless of international law, worshipping force, and giving us all to understand that her triumphs in the past and her power in the present were little compared to what she sought in the future.

"And now the great collision has come, and it is well that the democratic nations of the world—the nations, I mean, where the people own the government and not the government the people—should realize what is at stake. The French, English and American systems of government by popular election and parliamentary debate, with the kind of civilization which flows from such institutions, are brought into direct conflict with the highly efficient imperialist bureaucracy and military organization of Prussia. That is the issue. No partisanship is required to make it plain. No sophistry can obscure it. * * *

"This war is for us a war of honor, of respect for obligations into which we have entered and of loyalty towards friends in desperate need. But now that it has begun, it has become a war of self-preservation. The British democracy, with its limited monarchy, its ancient Parliament, its ardent social and philanthropic dreams, is engaged for good or for ill in deadly grapple with the formidable might of Prussian autocratic rule.

"It is our system of civilization and government against theirs. It is our life or theirs. We are conscious of the greatness of the times. We recognize the consequence and proportion of events. We feel that, however inadequate we may be, however unexpected the ordeal may be, we are under the eye of history. And the issue being joined, England must go forward to the very end."

This, then, is what England believes herself to be fighting for in the European War in which she has engaged; this is the burden which she believes herself to have assumed. She has long seen growing up upon the Continent a power essentially anti-democratic, whatever may be the measures taken to keep the mass of the population obedient and contented; a power which in the last resort conceives of even civil society as a disciplined machine, really always to be transformed into an engine of brute force, ready to the hand of an ambitious, a jealous, a ruthless master, surrounded by a great class of persons who regard themselves not as plain citizens of a commonwealth, but as apart from and superior to the mass of mankind, entitled to employ the mass of mankind for their own ends. A military caste, on the one side, a burèaucracy, on the other,—both of these are fatally antagonistic to ordered liberty and to the whole system of government, not by men, but by laws, such as is and has been the government of the Anglo-Saxon race for centuries and such as is growing to be the government of nation after nation in Europe and all over the world. Engaged in a contest to the bitter end for such a principle, it is certain that England will be as hard to buy off by the offer of an easy and advantageous peace as she was a hundred years ago.

INDUSTRY, COMMERCE AND FINANCE

Government Ownership of Public Utilities in the United States.—Some interesting figures bearing on the question of government ownership of public utilities, says the "Railway Age Gazette," are given in a bulletin on central electric light and power stations for 1912, just issued by the Bureau of the Census. The figures include comparisons of the operations of municipal and commercial plants. The bulletin shows that during the ten-year period, 1902-1912, the total number of stations increased from 3,620 to 5,221, or 44.2 per cent, and that while the number of commercial stations increased from 2,805 to 3,659 or 30.4 per cent, the number of municipal stations increased from 815 to 1,562 or 91.7 per cent.

Municipal ownership of these utilities seems to have become rather popular. If this popularity has been justified by an increase in efficiency or by improved service it would be expected that this would be shown in the figures for income, output and expenses. But during this ten-year period the total income of commercial stations increased 254.2 per cent, and of municipal stations 233.4 per cent; the output of commercial stations in kilowatt hours increased 375.8 per cent, and of municipal stations 174.4 per cent; and the total expenses of commercial plants increased 246.1 per cent, while the increase in municipal plants was 222.5 per cent. In other words, with three times the percentage of increase in numbers the municipal plants increased both their income and their output in less proportion than the commercial plants and had an increase of 222 per cent in expenses to produce an increase of 174 per cent in output, while the commercial stations, with only a slightly greater increase in expenses, obtained over twice the increase in output.

This is not the kind of efficiency that is promised by advocates of government ownership. Reduced to units of output the expense of producing electricity in municipal plants in 1912 was 3.15 cents per kilowatt hour, while that in commercial plants was only 1.96 cents. On the other hand, the total income of municipal stations grew faster than either their expenses or their output, while the commercial plants had a gain of 254 per cent in income to pay for a 375 per cent increase in output, which enhanced their expenses by 246 per cent. This would indicate that the commercial stations had their rates reduced, but that the municipal stations not only were more successful in maintaining their rates than the commercial stations, but were more successful in making rates high than in increasing production or controlling expenditures.

The bulletin does not give statistics showing the rates charged for service, but by dividing the total income by the number of kilowatt hours of output we obtain an average rate of 2.5 cents for the commercial stations and 4.3 cents for the municipal stations. The rate of the commercial companies had been reduced from 3.4 cents in 1902, while that of the municipal plants had been increased from 3.5 cents.

Figures are not given separately in the bulletin for the wages and salaries paid, but it is significant that the number of persons employed in municipal plants is shown as 10 per cent of the total for both classes of stations, while the kilowatt capacity of their dynamos was 7.2 per cent, and their actual output was 4.7 per cent of the total. The total number of persons employed in municipal plants increased 132.4 per cent in ten years, to produce an increase of 174.4 per cent in output. In the commercial plants an increase of 165.3 per cent in the number of persons employed produced an increase of 375 per cent in output. The commercial stations also were more successful in obtaining the greatest efficiency from their plants, the kilowatt capacity of their dynamos increasing 333.7 per cent for an increase of output of 375 per cent, while in the municipal plants the kilowatt capacity of dynamos increased 225.2 per cent for an increase of output of 174.4.

Of course, central electric stations are not railroads and municipalities are not the same as the Federal Government, but it is noteworthy that the more the results of Government activities are studied, whether in relation to their own finances or to the operation

by them of postoffice, railways, telegraph, telephone, or other utilities, the more glaring becomes the showing made of the inefficiency of political management as applied to business.

The Trade of the United States With Her Non-Contiguous Territory.—At the present moment when exporters are turning their eyes to new fields, a comprehensive view of the existing state of trade is important. The following table, setting forth our trade with our non-contiguous territory, shows a reasonably steady development, both in imports and exports:

TRADE OF PORTO RICO, ALASKA, HAWAII AND THE PHILIPPINES WITH THE UNITED STATES, 1899-1913.

	From the United States.	From Other Countries.	Ratio of U.S. to Other Nations.
IMPORTS.			
1899	$29,768,812	$19,058,942	60.9
1900	32,784,892	22,815,717	58.1
1901	32,278,093	32,768,719	40.9
1902	33,517,896	33,981,386	49.9
1903	36,682,707	34,850,701	51.2
1904	37,632,770	34,951,510	51.8
1905	42,992,003	32,168,837	57.2
1906	50,462,276	28,188,630	64.1
1907	63,680,134	32,497,483	66.2
1908	59,372,921	34,436,532	63.0
1909	63,853,693	30,707,313	67.5
1910	77,103,455	35,055,212	68.7
1911	92,286,523	40,361,723	69.5
1912	103,145,250	44,579,700	63.0
1913	110,015,441	42,741,357	70.8
EXPORTS.			
1899	$29,516,210	$15,681,714	64.2
1900	20,352,539	18,670,638	52.1
1901	36,116,216	26,300,135	58.1
1902	30,800,569	22,966,694	50.7
1903	61,385,603	24,941,322	71.1
1904	58,147,996	25,294,239	69.6
1905	78,214,672	20,908,715	78.9
1906	66,846,408	25,846,503	72.1
1907	75,376,348	28,279,920	72.7
1908	75,235,084	29,702,088	71.7
1909	90,153,498	24,820,398	78.4
1910	109,461,313	23,461,792	79.3
1911	109,051,447	30,082,018	78.3
1912	141,237,312	37,017,416	79.2
1913	127,735,679	44,606,020	74.1

* * *

Where the United States Feels the Pinch of the War in Europe.—The two tabulations given below show vividly the secure character of our national wealth. The first, prepared by the American Protective Tariff League, enumerates articles for which we are dependent upon foreign countries:

Agates	Molston
Alkali	Oil, recovered
Aluminum	Oil, olive
Amber	Oil, sizing
Analine dyes	Oil, finishing
Antimony	Ozokerite
Asphaltum	Potash, crude
Barytes	Potash, carbonate of
Bearings	Potash, caustic of
Bleaching powder	Potash, hydrated carbonate of
Bronze powder	Potash, niterate of
Carbolic acid	Potash, permanganate of
Card clothing	Pumice, lumps
Chamois skins	Pumice, powdered
China clay	Potato starch
Clay marbles	Rubber blankets
Clay, washed	Salt
Cotton, Egyptian	Saltpeter
Cyanides	Scheelite concentrates
Duplex paper	Silex lining
Egg albumen	Skins, sheep and calf
Emery paper	Shellac
Epsom salts	Silk, artificial
Ferro-manganese	Snake stone pencils and bricks
Flint pebbles	Solder
Gallic acid	Sugar
Hemp	Talc
Jute	Tin, bars, blocks, pigs
Kieserite	Tin, grain or granulated
Leather skins	Tinfoil
Linen	Transfer paper
Lime, Vienna	Tungsten
Lithographic tusch	Vanadium
Magnesia	Walrus hide
Magnesite	Watch crystals
Manganese	Wind shields
Mica	Wool
Moleskins	Zinc dust

The second, compiled from the Statistical Abstract of the United States, shows the amounts, in round figures, of the leading items of our home production, together with the percentage of each in the world total:

	Amount.	Per Cent.
Corn product (bushels)	2,600,000,000	68
Wheat product (bushels)	911,000,000	20
Cotton product (bales)	14,000,000	61
Sugar product (pounds)	3,577,000,000	10
Tobacco product (pounds)	791,000,000	35
Number of cattle on farms	59,000,000	15
Coal product (short tons)	534,000,000	40
Petroleum product (barrels)	238,000,000	63
Copper product (pounds)	1,243,000,000	55
Iron ore (long tons)	57,000,000	42
Gold product	$93,000,000	20
Stock of gold	$1,880,000,000	22
Value of all farm products	$9,751,000,000	No data
Value of manufactures	$20,672,000,000	No data

* * *

Imports of Potash into the United States.—One of the most important articles of import into the United States, from the point of view of its indispensableness to various industries, particularly the manufacture of fertilizers, is potash. In total value, our annual imports of potash fall far behind many other commodities; but our dependence upon it was well illustrated some two or three years ago, when the action of Germany in compelling the formation of a potash Kartell, or trust, and the fixing of a relatively high price for all the potash exported, even when the mines belonged to American owners, led to the raising of an international question between this country and Germany. Of late, since the European War broke out, there has been much uneasiness among American users of potash as to their obtaining the requisite supply for the coming year. Germany has virtually a monopoly of the potash mines of the world and hence of the world's potash supply. It is, of course, impossible to export potash directly through German ports; but, fortunately, the regular trade route followed for years past by the potash exported from Germany has been down the Rhine in barges to the ports of Holland, and thence by seagoing vessels to its destination. The way, accordingly, appeared to be open for the United States to obtain its supply as usual, provided Holland remained neutral. Much anxiety, however, was occasioned early in August by a Dutch proclamation putting an embargo on the export of potash from Dutch ports, on the ground that its possible use in the manufacture of explosives gave it a semi-contraband character. Fortunately, this decision was at least temporarily reconsidered by Holland, largely upon representations made by the United States to the Dutch Government. Accordingly, on August 31 the American Legation at The Hague was able to cable the State Department at Washington that the embargo on the export of potash has been for the time being at least removed.

The following table shows the imports of potash into the United States for each of the three past governmental years (July 1 to June 30):

	1912		1913		1914	
	Tons.	Value.	Tons.	Value.	Tons.	Value.
Kainit	485,132	$2,399,761	466,795	$2,154,977	541,846	$2,579,619
Manure salts	192,738	1,814,071	171,802	1,794,058	261,342	2,767,241
Muriate of potash	215,957	7,235,718	201,220	6,782,056	237,916	7,915,523
Sulphate of Potash	44,476	1,826,836	42,745	1,753,485	45,139	1,897,740
Totals	938,303	$13,276,386	882,562	$12,484,576	1,086,243	$15,160,123

INSURANCE

Articles on the Theory, Practice and Experience of Insurance.

Notes on Insurance, American and Foreign.

Items of Insurance News.

A YEAR or two ago, a sprightly contemporary of this paper, apparently perplexed that insurance should be treated by anybody as belonging to the great circle of economic activities and as having properly associated with it in the same pages others of those activities, threw a quip at us in the form of an ironic question: What has cotton to do with insurance? To-day nobody would venture to ask that question, at least in a carping sense. It is now plain enough, and in some respects only too plain that the interests of insurance and cotton are already closely interwoven and bid fair to be more so, before many months have passed. The concern of fire insurance with cotton at the present juncture has already been dwelt upon at length in these columns. The problem here does not grow easier from day to day. Without fire insurance cotton can be carried by nobody except the farmer himself, and even he is exceedingly foolish if he fails to cover the cotton in his barn or in his yard with fire insurance. Once cotton leaves the farmer's hands, however, fire insurance is absolutely indispensable to any further dealing in it or holding it. Cotton must be carried on credit, for all the actual capital in the cotton trade would not pay for 10 per cent of one cotton crop in the United States. Whoever (aside from the farmer) carries it, then, must borrow money upon it; and none will loan money on cotton unless it is insured against fire. And cotton is accumulating throughout the South in a way never known in the whole history of this country. The amount of it now being exported is so trivial, as compared with our normal exports at this time of year, that it may be said that the export of cotton does not exist. Nor is there prospect that it will begin again for weeks and perhaps months to come. Fortunately for the fire insurance companies as yet, the farmers are now for the most part compelled to carry their ginned cotton home with them, and there is no piling of it up in warehouses, compresses, terminals and the like. But this can be only temporary; out of the nearly 2,000,000 cotton farmers many must soon begin to sell their cotton, because they have got to live. Then will come the period of glutted storage places, of imperious demands upon the fire insurance companies, and of intense anxiety with regard to the moral hazard and other ills that insurers against fire have to contend with. We should hesitate to say how many million bales would probably be "sold to the insurance companies," as the saying is, if a firm cover on the basis of, say, 9 cents a pound could be obtained by the holders of cotton. There is now much enthusiasm throughout the South over the programme of "holding" the surplus cotton, until the world is at peace again, the markets are open, and the spinners have returned to their customary rate of consumption. But, as many a cotton merchant can testify from hard experiece, it is a weary thing to carry, or "hold," cotton. It does not pay its own way, like bonds or good stocks; on the contrary, the monthly bill for interest, insurance, warehouse charges, etc., which it imposes upon its owner becomes in no long time almost unbearable and his enthusiasm wanes in the same proportion as does his balance at the bank. If he resorts to arithmetic, he discovers that when he has carried it a year, he must sell at 1½ cents per pound higher than he paid for it, or else lose money. If this will not corrupt a man's morals, nothing will.

Fire insurance, however, is by no means the only form of insurance that is seriously concerned over the great cotton problem of the United States this year. The surety companies are being forced to give it an amount of attention beyond anything ever known by them before. Inasmuch as the sole thought of virtually all those who are trying to evolve a plan for dealing with the matter is to withhold the surplus cotton of this year's crop, storing it in warehouses until the price returns to a satisfactory level, the building of cotton warehouses of every kind and description is going on all over the South. And inasmuch as the validating of the warehouse receipts for purposes of collateral against bank loans involves the bonding of the warehouse companies and their officers, it is expected of the surety companies that they should stand ready to supply these bonds to such amount as may be required. Many of the warehouses will be of a flimsy and virtually temporary character, and many of the warehousemen will be inexperienced persons, unaccustomed to the difficulties attending the prevention of substitution of bales and the like; hence the risk involved in providing the cover will be far greater than is the case with well established permanent warehouses, manned by persons trained to the business. Yet there will be great indignation through the South if the surety companies show any reluctance to accept the risks or endeavor to charge rates commensurate with the risks. It has been proposed to obtain Federal supervision of all these warehouses, new and old, by means of a statute imposing a small excise tax. But nothing could be more unpopular in the South, especially at a time like this, than the imposition of any kind of a tax whose final incidence would finally be upon the cotton. Hence, no probability of adoption can be prognosticated for this suggestion. The surety companies will almost certainly be left to get along as best they may, under such State or local supervision of warehouses as is provided by the statutes of the various Southern States.

At first sight, it would seem that life insurance could not be much affected by the cotton situation, except in so far as the empoverishment of the South this year might temporarily reduce new business and cause the loss of old. In a variety of ways, however, the life insurance companies, particularly of the South, feel themselves vitally concerned. Many of them (and not a few Northern companies, too) have invested considerably in mortgages on Southern cotton lands and are apprehensive lest the farmers may be unable to pay their interest promptly, or even in some cases may be so reduced in circumstances as to be compelled to default altogether on their payments. Permanent losses to the companies on this account are little to be feared, as cotton must soon come into its own again; but temporary embarrassments and excessive foreclosures for a year or two are within the range of possibility. On the other hand, one of the younger Southern life insurance companies, the Pan-American Life, of New Orleans, has seen in the necessities of the situation an opportunity both to assist the hard-pressed cotton-producers and also to preserve and extend its own business. It has just announced that it will "extend to the

farmers the privilege of paying their life insurance premiums in notes secured by cotton in warehouses, and to further extend this facility to the farmers in the purchase of life insurance during the present money stringency."

Perhaps more striking than even this proposal, is one of President Warfield, of the Fidelity and Deposit Company, of Baltimore, to have the insurance companies actually buy and carry among their assets a certain amount of cotton. This proposal has led to a highly interesting exchange of telegrams between Mr. Warfield and the Secretary of the Treasury, Mr. McAdoo. Mr. Warfield's telegram was as follows:

Hon. William G. McAdoo, Secretary of the Treasury, Washington:

Following up my talk with you this afternoon, I respectfully ask, if this company should see fit to purchase cotton would your department, which quarterly passes upon the assets of all surety companies qualifying on bonds to the Federal Government, approve at the current or at a fixed price such an investment by this company? Should you decide to approve such investment I am sure that many other surety companies would gladly co-operate in aiding the South at this time of its great financial need.

EDWIN WARFIELD,
President Fidelity and Deposit Company of Maryland.

To this Secretary McAdoo replied, opening a wholly new vista of the possibilities of governmental action, as follows:

Edwin Warfield, President Fidelity and Deposit Company of Maryland, Baltimore:

Telegram received. If a list of the assets of your company submitted to this department should show the investment of your funds to a reasonable extent in cotton properly warehoused and insured, this department would recognize it as an available asset, at its fair market value in determining and passing upon your available resources.

W. G. McADOO, Secretary.

ANNUAL MEETING OF THE NATIONAL CONVENTION OF INSURANCE COMMISSIONERS.

THE forty-fifth annual meeting of the National Convention of Insurance Commissioners held its opening session on Tuesday of this week, at Asheville, N. C. Delegates were present from thirty-two States, there being forty-four delegates in all. A warm welcome was extended by Governor Locke Craig, who pointed out that since 1900 North Carolina had advanced from twenty-second to thirteenth place among the productive States of the Union. He spoke in eloquent terms of the progress of the South in recent years, and incidentally touched upon the war in Europe, and the fortunate position of the United States as being the only great power at peace with all the world. Other welcoming addresses were made by James E. Rankin, Mayor of Asheville; Rev. Brown, representing the Asheville Board of Trade, and James H. Southpass, formerly president of the National Association of Local Fire Insurance Agents.

The principal business undertaken on Wednesday was the hearing of papers on American restriction upon the classes of insurance written. Burton Mansfield ,of Connecticut, opened and was followed by Frank Hasbroucke, of New York, and J. W. Blount, of Maine. All three papers were referred to the committee on laws and legislation and no discussion was had, although invited.

The feature of the Thursday session was the discussion of workmen's compensation results in various States. The discussion was opened by Commisisoner F. H. Hardison, of Massachusetts, and reports were made for Connecticut, Idaho, New York, New Jersey, Illinois, Ohio and Wisconsin.

Through the kindness of the speakers we are able to give in full in this issue such addresses as our limited space allows.

SHALL WE ABANDON THE AMERICAN RESTRICTIONS UPON THE CLASSES OF INSURANCE WRITTEN BY (a) a COMPANY DOING DIRECT WRITING AND (b) A COMPANY DOING REINSURANCE

By Hon. Burton Mansfield*
Insurance Commissioner of Connecticut

WHEN your committee on programme selected this subject and invited me to prepare a paper upon the affirmative side, I accepted the invitation primarily for the purpose of promoting the discussion. As I have gone on in the writing of the paper, however, I must admit that I cannot see how any great harm would result, even if we should abandon what we commonly call the American classification, both as to direct writing and reinsurance companies.

It must be conceded that our inquiry assumes that there is such a thing as an American classification, which is to be distinguished from something else, whose existence we must also concede and to which in case of the abandonment of our own system we would naturally turn. This other system is commonly called the European classification. In order to understand these two systems, I desire to present an historical review thereof; this I am able to do with the assistance of Mr. Hammond,† who has gathered much of the material for me as well as prepared much of it for use. Let us look at the European system so called, from the historical standpoint.

Historical Review.

The methods and practices in regard to insurance, in Europe, vary exceedingly, as well as the laws and legal requirements relating thereto. We cannot within the scope of this paper attempt to differentiate between all of them and while there is much to be learned from their consideration we nevertheless must confine ourselves to the general principles involved rather than to a discussion of details.

How is it in England? The first Parliamentary Commission on Insurance was appointed about 1719 to look into all projects carried on by subscription in and about London and Westminster, upon a complaint to the House of Commons, that "several unjustifiable projects and undertakings, whereby great mischief may accrue to the public"—such as the creation of corporations for insurance purposes—were being proposed. Mr. Frederick Hendriks, in the "Assurance Magazine" (Vol. IV) gives some of the objections made to the proposition as follows: "Insurance of ships is necessary for foreign trade, and if the present be not found inconvenient, there is no reason to set up a corporation for insurance." He adds that the Attorney and Solicitor General reported to the King that the business of insuring ships had always been carried on as it then was—that there was no corporation in Europe for such purpose—and that making an experiment in a thing of this sort, if it should prove amiss, would be of the utmost consequence to trade. The creation of a corporation for the purpose therefore was considered unadvisable.

Later, when The Mines Royal Mineral, the Battery Works, petitioned for authority to insure ships and merchandise, the Attorney General's report said that the design of the petitioners "was

*An address delivered before the Forty-Fifth Annual Session of the National Convention of Insurance Commissioners.

†Acutary of the Insurance Department of Connecticut.

to make the experiment of insuring ships and merchandise as a corporation." The first charter was granted in 1720, to a company which now bears the name of The Royal Exchange Assurance Corporation, and provided for the insurance of ships and goods at sea. In 1721, a second charter was granted to the same persons, covering assurance of any life or lives, and casualties and accidents by fire. Still later, these two corporations were amalgamated. You will notice that these objections expressed in these reports were simply directed against organizing a corporation to carry on insurance. The argument was that inasmuch as no such corporation had existed hitherto therefore none was necessary. There is not, however, any reference to, or criticism of, a condition whereby one company could write life, fire, accident and marine insurance.

In 1799 a petition was presented to Mr. Pitt, then Chancellor of the Exchequer and Premier, contemplating a new company to write fire and life insurance, annuities, endowments for children, etc. The Privy Council in 1803 reported that it was "not expedient." Later, however, the company was incorporated to write marine, fire and life insurance under the name of the Globe Insurance Company.

In "A Review of some Recommendations of the Select Committee of the House of Commons on Assurance Associations (1853)" which also appeared in the "Assurance Magazine" (Vol. IV), Mr. Hendriks quotes from the report of the committee and says:

"That the ground hitherto occupied by these useful institutions has been comparatively limited.

"That their application is capable of great extension not only in the higher and middle classes of society but also among the humbler classes, to whom it has recently been very considerably applied.

"That it is therefore very important that no check or impediment should be placed in the way of the further extension of this enterprise, not absolutely needful for the security of the public.

"It has been brought to the attention of your committee that the business of assurance offices is becoming every year of a more varied character. This your committee regard as the necessary result of the advancement of the science on which it is based."

The above remarks are significant. Here was a select committee reporting on insurance and urging that "no check or impediment" be placed in the way of progress and recognizing multi-field insurance which was then being practiced without objection.

Let me now briefly refer to the charters of some foreign companies, not British, which write through their United States branches, risks according to the American system, but which in their own countries write multi-field insurance. Undoubtedly, many of these companies accept United States risks at home which they could not write in their branches here.

The charter of the Cologne Reinsurance Company, of Germany, authorizes reinsurance against fire risks, risks of transport by land and water, damage by hail, as well as life and accident insurance.

Another German company is authorized to write the following different insurances, namely: Insurance against risks of any nature in course of transportation and during storage of the goods transported, including the means of transportation and other objects in the line of marine insurance; against damage of glass; against the effects of illness and accidents, and liability insurance of all kinds; against damage owing to theft and burglary; and damage of any kind caused by leaks of water pipes; against explosion of steam boilers and plants; and against losses in operating returns and rents due to any kind of damage to property; against other losses in rents; in addition to all this, this same company is authorized to insure horses, and vehicles of every description, and to issue fidelity, surety and guarantee policies, and to write reinsurance in all branches of insurance.

The charter of a Bulgarian company states that the object of the company is to transact, both at home and abroad, all lines of insurance and reinsurance, as follows: against fire and all its consequences; against hail-storms; against the risks of transport of every kind; against bodily accidents and all their consequences; and upon the life of persons in all its usual forms, as well as in every other branch which the directors may consider expedient to be carried on with profit.

By referring to the annual statement of this last mentioned company for 1913, I find that apparently the board of directors have seen fit to carry on more than one line of insurance, for the balance sheet shows transactions in fire, marine, life, accident and miscellaneous insurance.

Lastly, a Bavarian charter, that of the Munich Reinsurance Company, provides for the granting of reinsurance on insurances undertaken by companies, associations, corporations, or persons in Germany and abroad, and adds that the reinsurances undertaken may relate to either life, fire, marine, and transports, or hail insurance, and to such further classes of insurance as the directors may decide. An examination of a recent statement of this company shows transactions in four separate kinds of insurance, namely: fire, accident, life and marine.

France and Italy also allow their companies to write both fire and life insurance and several of them do so.

Let us now look for a few moments at the historical situation here.

In 1819 the Legislature of Connecticut granted a charter to the Aetna Insurance Company. This charter was amended in 1820 in order to permit the company to add to its then actual capital the sum of $50,000, and to increase the same from time to time, to a sum not exceeding $150,000; said amendment also provided that the whole of said capital stock should be denominated the annuity fund, and be secured and paid into the treasury of said corporation, and vested in the same proportion and manner as is authorized and required by the act to which this is in addition, in relation to the fire insurance stock thereby created. The stock created by this amendment was to be exclusively held out and pledged as a fund for the payment of annuities granted by said company, and of losses upon insurance for a life or lives, or in any way dependent upon life or lives, and could in no case, be liable for the other debts, contracts, liabilities, or engagement of the said company. Here we have an example of legislation enacted nearly a century ago in Connecticut which not only combined life and fire insurance in one company, but which made provision for at least a partial segregation of the assets.

In 1853, upon the petition of the Aetna Insurance Company it was resolved by the Legislature of Connecticut "that the shareholders of the 'Annuity Fund' of the said 'Aetna Insurance Company,' their successors and assigns forever, be and they are hereby made and constituted a body corporate and politic, for the purpose of life insurance and for the assumption of all or any hazards connected with life risks by the name of the 'Aetna Life Insurance Company,'" etc. This life insurance company which acquired its charter in this curious way is also compelled from time to time to seek reinsurance in unauthorized companies, either because it cannot find reinsurance facilities among the authorized companies or because the reinsurance companies with which it wants to deal, and which in turn undoubtedly possess sufficient retrocession facilities to meet its demands, cannot be authorized under the General Statutes of the State of Connecticut to transact multi-line business in the State. Recently the officers of this life company, desiring

to be able to accept risks in a few of the classes of fire insurance, procured a fire charter and had it amended by the Legislature to meet its wants. This is but one example of a company forming a cognate company so as to better cover the field. Others could be cited. By this method the field of a company is in effect enlarged so that it can do indirectly what our system stipulates cannot be done directly.

In 1859, a citizen of Connecticut, Mr. James G. Batterson, while traveling abroad, purchased a railway insurance ticket from a station agent of the Great Western Railroad. This interested him so much that he visited the offices of the company which issued the ticket and looked into the methods of this kind of insurance. On his return home, as a result of his investigation, the Legislature of Connecticut granted a charter in 1863 to The Travelers Insurance Company as a "railway passenger insurance company." This company is doing business to-day and is authorized to write in all parts of the United States accident, life and various other kinds of insurance, which it has been authorized to do from time to time since 1863.

In October, 1871, the National Convention of Insurance Commissioners discussed a proposed reciprocal general insurance law, which provided that 'no company hereafter organized in this State shall make insurance upon the lives of individuals, nor grant, purchase, or dispose of annuities, unless organized solely therefor, and doing such business exclusively." The word "hereafter" was introduced, says the secretary of the convention, "for the purpose of not interfering with existing life and accident companies, so that the State of Connecticut could if it chose, pass the act without throwing out the already chartered life and accident companies." The actuary of the Insurance Department of Missouri conceded the propriety of not permitting a life company to do a fire business, but saw no impropriety in permitting a life company to do an accident business, provided the accounts were kept separately, and the reserves were properly maintained.

Hon. George W. Miller, then Superintendent of Insurance of the State of New York, during the discussion, said: "Some of the British companies that do business in this country, do both a life and fire business at home, and until recently there was no discrimination in the law, or, in fact between life and fire assets. They were held in common, as a general rule, although some companies may have made a distinction. But under an act of Parliament, passed last year (1870), they are now required to keep those assets separate; to hold life assets entirely distinct from fire assets and to state them separately; and one shall not be held for the liabilities of the other. The law is eminently proper and they have to this extent sanctioned the wisdom of the New York law, and of all other laws in this country." These words of Superintendent Miller voiced the principle which had been set forth five years before by Superintendent Barnes in a report to the Legislature of New York, in which he says: 'It is regarded by the Superintendent as highly important to the preservation of the present high status of our life insurance companies, that they should be rigidly and totally restrained from entering into the field of general accident, casualty, and other miscellaneous insurance. * * * If life companies are allowed to write any other kind of risks than those strictly appertaining to life contingencies, the whole field of fire, marine, casualty and miscellaneous insurance will sooner or later be opened to them." This utterance of Mr. Barnes made fifty years ago has to a large degree come true. Life companies have not been confined to the life field, but, on the other hand, nearly every State permits them to write casualty and miscellaneous insurance in connection with their life business. Section 3541 of the Statutes of Connecticut even provides that companies chartered to write life insurance only, may also write health and accident business without amendment to their charters. As recent as last year the Metropolitan Life Insurance Company was given power to write health, accident and liability insurance. Only last March, Mr. Emmet, then Superintendent of Insurance of New York, in considering the application of an insurance company authorized by the Legislature of Connecticut to write reinsurance in all fields, to be admitted into his State, as a fire insurance company, said that he had never particularly sympathized with the insistence on the part of his department to exercise extra-territorial jurisdiction over companies of other States. Again as recently stated by Mr. Hotchkiss, a former Superintendent of Insurance of New York: "though a mono-field State, New York, next to Connecticut, has gone furtherest in bringing about in the United States the European multi-field system." These brief references indicate at least, I think, a general inclination to enlarge the classification in the United States as compared with that which formerly prevailed.

In the early part of the last century New York and Pennsylvania had companies authorized to do both a fire and life business.

We have seen that during the discussion at the National Convention of Insurance Commissioners in 1871 Superintendent Miller of New York referred to the Act of 1870, calling particular attention to the fact that British companies were compelled to keep their assets separate. This principle of the British Insurance Law must not be lost sight of. What Superintendent Miller emphasized then we must admit is of primary importance to-day.

This principle was extended in the Assurance Companies Act of 1909, in an annotated edition of which, published in 1910, I find the following: "Separate accounts are to be kept in respect of each class of insurance business (except fire and accident) and the receipts in respect of each class of business are to be carried to and form a separate assurance fund, and that fund is to be as absolutely the security of the policyholders of that class of insurance business as though it belonged to a company carrying on no other business than assurance business of that particular class."

Prior thereto "By the Life Assurance Companies Acts, 1870-72, it was only necessary for companies to keep the life funds separate; now it is made compulsory that the accounts in respect of each kind of business shall be separately kept and that the fund in respect of each kind of insurance shall be specially earmarked as security for the policyholders of that class."

While I am thoroughly convinced, as Superintendent Barnes appears to have feared back in 1865, that the whole field of insurance will ultimately be opened up without restrictions as to class of business written, I am just as positive that such a step when taken must provide for the insurants of the United States, safeguards at least as sufficient as those referred to above. Assets should be segregated, and the reserves, as well, for I believe our present methods of setting aside reserves are in advance of the European methods—calculated accurately as specific liabilities.

If any of you have examined the Special Acts of Connecticut of 1911 (and I am reminded that some of you have had occasion to do so in regard to the matter to which I refer) you will find that at that session a charter was granted authorizing The First Reinsurance Company of Hartford, "to carry on a reinsurance business, and to make reinsurance on insurance risks of every kind or description undertaken by other insurance companies, associations, corporations, or persons, and in so doing may co-operate with other companies, associations, corporations or persons; and to make contracts upon any and all conditions appertaining to or connected with the reinsurance business of whatever kind or nature; upon such terms and conditions as shall be from time to time ordered or de-

termined." This charter is quite un-American. It is decidedly of European type. Nevertheless, it seems to me fitting that a charter unique in the more recent insurance history of our country, containing an idea advanced at least from our standpoint should emanate from the State, whose early settlers framed the first written constitution of government, and which now stands at the top in the development of insurance in this country. It is particularly significant that this charter was approved by a Governor, who has believed in freedom of incorporation for a long time and who, in an article on that subject, in commenting upon the adoption and change in general incorporation laws, said: "Each new law has thus been the occasion of others, but each has left the vital principle of free incorporation untouched. It is so in accord with the spirit of the age, that it must ultimately prevail in every country where any degree of individual liberty exists."

This company undoubtedly gave rise to our discussion. As was to be expected it has had some trouble in gaining admission to other States. Superintendent Emmet, when he admitted this company to New York, stated: "My primary reason is that this company does an exclusively reinsurance business and is in no wise concerned with the direct writing of insurance. Our present New York law does not, it is true, draw any distinction between reinsurance and direct writing business, but the belief is very widely held among insurance people that there is a very real distinction between these two lines of business. In this I concur. * * * It is scarcely possible to conceive of reinsurance as under any circumstances injuring the insuring public. It is very easy, under many circumstances, to see the benefits to the insuring public which flow from reinsurance. So viewed, I think a certain distinction between reinsurance companies and direct writing companies is obvious. * * * Absolutely the only argument against admitting it here, as a fire reinsurance company is the fact that it has charter powers, granted to it by the State of Connecticut, which would enable it in Connecticut to do certain lines of reinsurance business, which a fire reinsurance company cannot do in New York. * * * This company is unwilling to abandon all its Connecticut charter rights, as a condition precedent to its being admitted to do a fire reinsurance business in New York, although of course it has no expectation of availing itself of any of these rights within the State of New York, except the power to reinsure fire risks. It has, however, filed with the department an agreement not to exercise some of these charter powers even outside the State of New York."

Commissioner Hardison in his last annual report under the caption, "All-Embracing Charters," says:

"There is another phase of the reinsurance question which has been forcing itself upon public attention, and that is the contention that a reinsurance company ought to be given authority to reinsure all kinds or classes of risks, in spite of the fact that in this country it has always been considered sound policy to confine a direct writing company to covering only certain classes, as, for instance, life and accident, or fire and marine in the same company. In foreign countries it is true the practice is different. There a company is permitted to write all kinds of insurance, even the most hazardous, at the same time writing life insurance, and generally without government supervision. It is a fact that there has been a growing tendency in this country to break over our old established rule. In this Commonwealth within the last twenty years the number of lines that may be written by an insurance company have been greatly increased, so that now with a capital of a million dollars a company may cover a wide variety of what are known as casualty hazards. It is now attempted to push this even further. In a neighboring State a company has been specially chartered to do all kinds of insurance business. It is, however, not a direct writing company, but must confine its business to reinsurance. Its application for admission to another State raised the question in that State whether a reinsurance company should be given greater latitude in the kinds of insurance it may assume to write than a company which takes business by direct policies issued to the insured. The question was not pressed for a settlement, as legislation was necessary in the State applied to in order to admit the applicant to cover the whole insurance field. But it is bound to come up later in every State, and be broadened out to the wider issue of permitting all insurance companies to assume all kinds of risks, thus doing away with the old distinctions of fire and marine insurance companies, and also giving to life insurance companies, which have hitherto devoted their energies to insuring lives and conserving the funds which come into their possession for guaranteeing the payment of their obligations, the right to enter the field now occupied solely by fire insurance companies, as well as all other fields."

In 1885 Mr. Richard Teece in a paper on "State Supervision in Insurance," read before the Insurance Institute of New South Wales, said:

"The aim of British rulers—in our day at least—in this matter has been to provide that while no enterprise shall be checked by needless restrictions, it shall not be prosecuted in concealment; that while it shall be allowed to shape its own course, and pursue its own career, it shall leave beacons along its path, in order that those who are in search of it shall be able to find it; that while it shall be permitted the full exercise of the capacity to conceive and the ability to execute whatever designs may appear necessary to its development, it shall not execute (however much it may conceive) anything which shall be prejudicial to the State or injurious to the interests of the people committed to its care."

In referring to supervision in the United States Mr. Teece says, "there is no fusion of all branches—fire, life, marine, etc.—in one company, as with us, but a life assurance company is prohibited from transacting fire or marine business."

"In considering the history of insurance legislation in America, one cannot fail to be struck with the hostile attitude assumed by the legislatures towards the companies. One would think that life (and indeed all) insurance companies, which are admittedly capable of conferring the highest benefits on the community in which they exist, would commend themselves to the tenderest solicitude on the part of the State."

You know and I know that the conditions to which I call attention are the natural results of our restrictive governmental supervision. They have become more manifest in recent years than formerly. Why the freedom of incorporation which prevails in this country in regard to other commercial enterprises does not apply equally to insurance companies, is a matter which cannot be satisfactorily explained. It seems to me that the limitations which have been placed in general upon the corporate powers of insurance companies in the United States constitute a marked exception to the principles and practices in other fields of operation, and is in strong contrast to the principles and practices in operation in England and other European countries.

In 1895 Mr. T. E. Young in his introductory address before the Birmingham Insurance Institute made the following comparison between British and American methods in his discussion of the evolution of the then present condition:

"It cannot be affirmed that the wealth, solidity and number of British companies, as compared with those in America are due to any deficiency of mercantile enterprise among the American people, but are largely dependent on the fact that advancement in the one case is prevented by the unnatural obstruction interposed by

the conjoint forces of commercial protection and minute governmental intervention, while in the other case, the line of least resistance is kept clear and free by the invigorating force of freedom of trade and of that ample scope for development which combined enterprise possesses wherever the enfeebling and paralyzing power of government control is unknown."

Mr. Young further says that "the history of insurance is a passage from the homogeneous to the heterogeneous as a portion of the general development of business enterprise." He points out that while insurance was formerly confined to marine, fire and life insurance,—burglary, surety, hail, accident and many other forms of insurance have been added. As a parallel to this he calls attention to "the same advance from homogeneity to heterogeneity, from sameness to diversity, in the circumstance that individual companies now comprise, in addition to fire and life insurance, or even fire, life and marine, the application of insurance to leaseholds, issue risks, 'name and arms' protection; with powers to include fidelity and accident contingencies."

It may be objected by some that but few companies comparatively have availed themselves of the privilege of writing multiple lines under the European system and that therefore the system has not proved itself. That but few companies have exercised this privilege is true, I believe, but that argues well for the system and goes far to show that the system has not been abused. I do not contend that all companies must write all classes of risks. I argue simply, for the principle of freedom in this regard. Remove the restrictions and allow the matter to be worked out under the operation of those laws which should naturally govern under such circumstances.

Two points in passing.

First. I am informed that a certain company which operates in nearly if not in all of our States offers a part of its excess risks to a foreign company which is not and cannot be authorized to transact multi-field insurance under our laws, because of the restrictions resulting from our system of supervision which, as aptly stated in the Encyclopedia Brittanica, "meddles with all its details for the avowed purpose of securing the safest and best public service." This direct writing company seeks this protection with a foreign reinsurance company which automatically accepts the risks ceded to it and which in turn distributes them just as automatically among various retrocession companies. The reinsuring company is a foreign company; probably the retrocession companies are all foreign, too; and probably no one of them is admitted to the United States.

Second. This company files with the Insurance Department of Connecticut and probably with every other insurance department in this country two annual statements upon forms agreed upon by the National Convention of Insurance Commissioners. On one of these forms it reports its transactions in accident, health, liability, workmen's compensation and other lines of insurance, which are commonly grouped under the term of miscellaneous or casualty insurance. If its charter permitted and the company chose, it might add many other lines—live stock, credit, fly-wheel, burglary, physicians' defense, property damage, title, fidelity, surety, plate glass, steam boiler, etc., etc. Notwithstanding the addition of these lines, supervising officials in various States even under our present system of minute government supervision, could authorize this company to write all of these lines and without any increase in the capital or other resources. These lines of insurance simply fall into a group which has a generic title and which, because of the artificial classification that has grown up in America, and from which we are apparently reluctant to depart, is recognized and permitted. We have therefore in the so-called miscellaneous or casualty insurance field recognized, partially at least, the theory of the evolution of insurance from homogeneity to heterogeneity. What possible relation is there between live stock insurance and credit insurance, between physicians' defense and property damage, between surety and plate glass? None save that they are all insurance. Yet all these lines which the convention blanks recognize can be written in this country by a certain class of insurance companies, demonstrating clearly that the so-called American system of classification *per se* is a misnomer and largely, if not entirely theoretical. This condition of affairs clearly demonstrates that the American restrictions upon the classes of insurance written by a company doing direct business are only in a measure restrictive. Such American limitations are American prejudices under another name, which, I do not believe, would exist long if the insurance commissioners of this country would take the time to fairly analyze the situation.

Our problem, therefore, is hardly a new one. It implies that certain practices have grown up in America which have limited or restricted the classes of insurance which an insurance company may write. I do not believe that we in America have conducted experiments of sufficient magnitude along this line of investigation or made such a scientific analysis of this question as to be able to declare finally that our present classification of insurance risks should be maintained and that a company seeking a charter in one of our States or asking for authority to transact its business within her borders must confine its operations to the American rule of mono-field insurance rather than to the European rule of multi-field insurance. I am of the opinion rather that existing conditions are based on artificial sentiment, and as stated by Mr. E. R. Hardy, librarian of the Insurance Society of New York, is largely fortuitous and contrary to those tendencies in our commercial activities generally, which promote larger aggregations of capital and greater freedom in operation.

Already the inexorable law of supply and demand is operating to the disadvantage of American companies. These companies are compelled to seek protection for themselves in their larger insurance undertakings by offering their excess lines to companies which are not authorized to transact business here. It is often difficult for direct writing companies to make cessions automatically. In turn it is well nigh difficult, in many instances, for reinsurance companies accepting these excess lines to procure such retrocession and sub-retrocession facilities as will properly distribute the losses should they occur and protect the hazards of the risks assumed. This is in direct contradiction to the principle of association for the distribution of losses which is the essential economic significance of insurance, and insurance is, I believe, "that social device for making accumulations to meet the uncertain losses of capital." There appear to be two ways to reduce the uncertainty of losses and the cost thereof, viz.: by prevention and by the transfer of risks. At present we are primarily interested in the second. Certainly we should progress toward universal insurance rather than gravitate toward latent or self-insurance. In any case, however, the outcome will ultimately find its full expression in accordance with economic laws whether the statutory regulations be broadened at once or not.

Much of our knowledge concerning any subject is necessarily derived from the experience of others. If that experience has been adverse we should decline to change our ways. If on the other hand that experience has not been adverse, may we not reasonably conclude that we could safely adopt a new way in preference to one which is more narrow and restrictive?

Are we not now in a position somewhat similar to that held by the learned Attorney General, who in 1719, opposed a new order

of things because the old apparently sufficed? England did not ultimately accept his opinion and the legislatures of our States may not accept as final what I assume to be the opinions of a majority of our supervising insurance officials, so far as they relate to the question before us. The experience of England and elsewhere is too important to be disregarded. Apparently there has been little or no criticism of the European system. Had there been, I am sure that such prominent men of insurance affairs as those from whom I have quoted, would have voiced such criticism long ago. We have accepted the European system of classification as a fact and we must conclude from the evidence presented that it has not been a subject of criticism. It seems to me therefore that the American method of classification should be abandoned to meet the present insistent demands of which we are cognizant.

Mind you, I am aware, that as stated by Commissioner Hardison, our practice is different from foreign countries, and that abroad there is less government supervision than in the United States. I am not contending that we should abandon both the American system of classification and all government supervision. I simply urge the former. Surround it if you please with that supervision which you think proper, but do not lose sight of the main issue that the restrictions imposed here now do not permit the economic significance of insurance a fair expression. The economic forces which are at work, the ones which are emphasizing this question now, are too great for us to pass over lightly or to oppose successfully. "The change," the Commissioner of Massachusetts says, "is not necessarily dangerous because it is a change, but it should not be adopted until it has had most careful consideration in order to determine beforehand, if possible, whether it will operate as well in this country as in older ones, where business is conducted on a less high-pressure basis than by some corporations here." I endorse this. The words contain that conservative warning which we of course must bear in mind. What I advocate and what I believe is inevitable, is only the natural outcome of insurance growth in this country; it is not revolutionary but evolutionary.

Former Superintendent Hotchkiss to whom I am much indebted for valuable assistance, in the preparation of this article, in a discussion of our American system recently made this suggestion:

"So long as we continue to believe in the classification or single field system, as distinguished from the multi-field system abroad, any uniform reinsurance law should deny to reinsurance companies multi-field powers. If we are to abandon our classification system —and there are already signs that we may—we should abandon it directly, not by indirection. Rightly or wrongly, we, Americans, have heretofore refused to permit the policyholders in one class or field to be put in jeopardy by the hazards of an entirely different class or field. More, we have prescribed different reserve requirements in each field. This from the beginning has been our theory and our practice; it is embedded in our laws. The business operations in the home offices of hundreds of companies recognize this division. Foreign multi-field companies have come to our market and—while doubtless protesting—have recognized it by establishing mono-field United States branches. This is the law of the land, not merely by statute but by insurance practice affecting home office and field, and the public as well, and has been such for considerably more than half a century. Our American classification system cannot, therefore, be changed without great shock—shock that would unsettle the insurance business for a number of years. Nor should it be changed nor broken in upon in any legislation that may be proposed affecting reinsurance alone."

Frankly, I cannot quite agree with my learned friend that our system cannot be changed without "great shock," although I quite agree with both him and the Commissioner of Massachusetts, that if it comes, it should be applied to both direct writing and to reinsurance. In this latter respect I should again differ from the stand taken by Mr. Emmet in his recent ruling from which I have hereinbefore quoted. I believe that it is both a natural and logical conclusion that our policy of limitation should be abandoned as regards both direct writing companies and reinsurance companies. My remarks thus far have been confined to the general subject. We can see, however, that it is the lack of reinsurance and retrocession facilities in the United States that makes this subject important and worthy of our careful deliberations. On the other hand I do not comprehend why we need make any distinction because of this fact. It is simply a condition. The principle of restriction is wrong as regards the writing of all insurance risks. It undoubted'y applies differently to different classes of companies, but that is a matter of detail. In this connection, however, there is one point which I want to bring out. Increase reinsurance facilities and direct writing companies will use them more freely than at present. This will tend to diminish the amount of reinsurance which is now being exchanged between direct writing companies. I do not know but that it would be a good thing if direct writing companies would confine their activities to the direct writing field and the reinsurance and retrocession companies to the reinsurance field.

A recent article by Mr. Hotchkiss gives a very able presentation of our subject as far as it affects reinsurance retrocession. He points out clearly the demands which I have mentioned and refers at length to three legislative bills which were introduced during 1914:

1. The Massachusetts bill to prohibit retrocessions to non-authorized companies.

2. The New York bill to permit reinsurance companies, as distinguished from insurance companies, to operate in all the different fields.

3. The New Jersey bill to prohibit reinsurance in excess of at least twice the amount of the liability retained by the direct writer.

These bills are another evidence of the importance of our subject, and as Mr. Hotchkiss points out, indicate the chaotic condition of American sentiment as to the great subject of reinsurance and —as nothing else in recent years—suggests the necessity of an American policy which will lead ultimately to the establishment here of a scientific reinsurance and retrocession system like that abroad. Briefly the Massachusetts bill presents an extremely restrictive policy while an evidence of the American tendency in the opposite direction appears in case of the New York bill. The New Jersey bill, on the other hand, seems to be aimed in still a third direction.

Assuming the conception of the idea that the American restrictions placed upon the classes of insurance written should be abandoned as a fact and not simply as an idea, let us take up very briefly a few points which we undoubtedly would be bound to recognize under such circumstances, whether we were dealing with direct writing or reinsurance companies.

Statement blanks would have to be prepared upon such a basis as to permit a company writing under an "all-embracing charter" to show its various transactions in an intelligent manner. We, as insurance commissioners, already recognize in the miscellaneous blank the principle of multi-field insurance. The proper kind of a statement blank for such a company need be but a little more extensive than the blanks now in use, the most important part of which is the liability page. The reserves as now reported are by no means similar in their construction. It is merely a matter of detail to make provision in a single blank for the appropriate re-

serves for all classes of insurance risks. Add, if you please, a conflagration reserve for companies writing fire hazards and make any reasonable requirement as to surplus as regards policyholders. These are matters which would have to be worked out and concerning which I do not anticipate there would be much difficulty.

The theory has been advanced that the loss experience of a reinsurance company cannot be better than its ceding companies because the latter make their own selection of risks while the former must as a rule accept what is given them under treaty arrangements. I think that this result will probably prevail, but will not the law of average operate as usual? I do not believe it is a matter of much concern. At least it seems to me that it is a matter for company underwriters to worry over and not for insurance commissioners, except in rare cases.

Other points might be discussed as illustrative of what might arise under such a change as I contemplate. They all seem to reflect improved conditions. For example, greater reinsurance facilities would tend to minimize reciprocal arrangements between direct writing companies by which many times competing companies become acquainted with each other's "stock in trade." Much of this class of reinsurance would probably become obligatory reinsurance under treaties or even faculative reinsurance with a general agreement existing between the companies interested. Another point—much of our trouble and bother over surplus lines would be eliminated. Then, too, the broker who now arranges reinsurance treaties and who may not have the interest of the contracting parties at heart would have to leave much of this work to the reinsuring and retrocession companies—namely to men interested and skilled in such matters. So-called substitutes for reinsurance facilities such as the Reinsurance Bureau of New York, Workmen's Compensation Reinsurance Bureau, the Excise Reinsurance Bureau, etc., while operating now as valuable factors in different classes of insurance, would be free to further distribute their risks.

My conclusions may be briefly summarized as follows: The European system of classification has existed for nearly two hundred years without criticism. There has been no great stampede of companies to write at once all classes of insurance. Rather the tendency to enter all fields has been dignified, those companies which have availed themselves of the freedom of the system, being among the strongest in Europe. For a century in our own country the tendency has been toward the European system. While Massachusetts has been largely a mono-field State, Connecticut has accepted the principle of multi-field writings and New York is approaching the same position as Connecticut. So called multi-field insurance is practically now being practiced by casualty companies. The abandonment of the American restrictions upon the classes of insurance written, by both a company doing a direct business and a company doing reinsurance is but a step.

Just a word more. Any analysis of this question reflects our experience. We are, however, too willing many times to follow the historical precedent of this country in preference to progressing into newer fields which are admittedly more appropriate. Carlyle somewhere says that a nation's history is its true Bible. The Governor of Connecticut in commenting on this expression has remarked, "If so it be, the last books must be better, wiser, truer than the first. There must be a new testament built upon the old —with its broader, freer, higher life." Let us therefore bear this precept in mind, and see if, in all fairness, we cannot use and adopt a wiser and better system of classification in the United States, even if among other changes it involves less harrowing expeditions on our part into the multitudinous details of a great business, conducted for the public good and forming a very large element in our national prosperity and growth.

Why hamper and restrict the immense insurance activity in this country by needless practices or laws? That activity should be enlarged to find its normal expansion into all reasonable fields and in all reasonable ways.

THE COST OF MISCELLANEOUS INSURANCE

By Hon. S. Epsteen*
Insurance Commissioner of Colorado

INTRODUCTION.

IN asking me to present a paper on "The Cost of Miscellaneous Insurance," the secretary of this convention stated that it was tacitly understood I would also discuss the question of adequate reserves. Accordingly, I have analyzed the present method of calculating reserves, and also five new methods which have been proposed:

1. Increased Percentage method.
2. Pay-Roll Exposure method.
3. Wolfe's method.
4. Pure Premium method.
5. Daly's Rate method.

It seems to me that the last two are the best; further, that the Pure Premium method cannot be put into practice, owing to the lack of sufficient statistics. In consequence, Daly's method of basing reserves on the established manual rates is the most immediately practical of the methods which have been suggested.

In my estimation, reserves based on standard rates will go a long way toward solving many of the perplexing difficulties which now exist in miscellaneous insurance. I have therefore asked Mr.

*An address delivered before the Forty-Fifth Annual Session of the National Convention of Insurance Commissioners.

Daly to write out in detail an explanation of his method. This he has kindly consented to do, and it is appended as Part II of this paper.

PART I.—THE MAXIMUM OR TOP-EXPENSE PLAN.

By S. Epsteen.

1. If one should take the list of all the casualty companies operating in the United States, and cross out the names of those which have been selling insurance less than three years, and also leave out those companies which, owing to the nature of their business, have heavy inspection costs, it will be found that the number of remaining companies is sixty-seven. If, also, the reader would take the total expense of each of these sixty-seven companies (exclusive of losses and adjustments), and divide by the premium income, he would find:

Eleven companies are operating at less than 40 per cent.

Twenty-seven companies are operating at a cost of 40 to 50 per cent.

Twenty-nine companies are spending more than 50 per cent of their income.

As a rough classification, we might say that the eleven companies operating at less than 40 per cent are economically managed; that the twenty-seven companies whose expense ratio is betwen 40 and 50 per cent are managed in a moderately economical way (although improvement is possible in these cases); and that the remaining twenty-nine companies are managed in an extravagant manner.

It might be argued that a stock company has a right to spend as much as it pleases. There is a measure of truth in this; but it is not a statement of the entire truth. Insurance is a matter of public interest, and the people of the United States will not tolerate an expense ratio in excess of 50 per cent—if they know the facts. I firmly believe that, if some of the enormous expense ratios of companies are not reduced to within reasonable limits, the entire business of insurance will be materially injured. I do not believe that it would be a wise proposition for the States to engage in the business of casualty insurance. I do not believe that State rate-making is practicable; but I greatly fear that, if the large expense ratios are not reduced, we shall have State insurance and State rate-making—to the detriment and injury of many established, well-constituted, and properly managed insurance companies.

It would be a grave error to set an expense ratio and tell all the companies to operate within that limit. It is perfectly obvious that some lines of the casualty business are more costly than others. A company which does chiefly health and accident business is under a heavier expense ratio than a company which does chiefly liability business; a company which does fidelity and surety business is obviously under a heavier expense ratio than a company which does chiefly compensation business. This leads us to the fundamental proposition of the Maximum-Expense theory, viz.: A maximum or top expense should not be set for a company as a whole, but should merely be set for each line of business which the company conducts.

2. The disbursements of a casualty company may be divided into four groups:

A. To policyholders, including losses, adjustments, service, investigations, and inspections.

B. State taxes and fees.

C. Dividends to stockholders.

D. Expenses, including commissions, salaries, printing, stationery, traveling, advertising, postage, bureau, etc.

As regards Class A but little need be said on this occasion. Possibly it would be well to call attention to the inclusion of the word "inspections" under this heading. It is customary to include inspections under "expenses." To my mind, this is incorrect. For example: Suppose a company does a considerable amount of boiler and fly-wheel insurance; obviously the inspections go to diminish the losses; therefore, inspections should be charged as service to policyholders, and should not be charged as an expense against the administration.

The State taxes and fees are too high now; they should be very materially reduced. The State has no right to ask a company to reduce acquisition and management expenses, and then turn around and increase State taxes. What is sauce for the goose is sauce for the gander. The State should do its share toward reducing the disbursements of a company by lowering or abolishing taxes and fees which are now charged in excess of the cost of supervision.

The question of dividends to stockholders I shall not discuss. This is entirely a private matter, and is justifiable if a company is making a profit.

This brings us now to Class D, and it is this item which is susceptible of a top limitation. To repeat what has already been said, this limitation should not apply to a company as a whole, but merely to the separate lines of the company's business. I am not at all sure what the exact limitation should be on each line. However, in order to be definite, I shall present a tentative programme, and shall be very happly indeed to modify the percentages which I name in accordance with the discussion and suggestions which you will make at this meeting, or in leters which any one who reads this paper may write me.

Expenses of Class D, above (Including Commissions, Salaries, Printing, Stationery, Traveling, Advertising, Postage, Bureau, etc.)

Class.	Tentative Maximum (Per Cent).
Compensation	30
Employers' liability	35
Other liability	35
Credit	35
Property damage and collision	35
Boiler	40
Accident and health	45
Burglary	45
Plate glass	45
Fidelity and surety	45

It will now be shown by two examples how I arrive at these tentative expense limitations: First, compensation, 30 per cent. The commission paid to the agents is 17½ per cent. This allows 12½ per cent for home office and the other expenses enumerated in Class D. It may be in place, at this point, to state that, in my own estimation, 27½ per cent is adequate for compensation business, and that I have named 30 per cent in order to allow a little leeway for various opinions which have been expressed. It might seem, at first glance, as if my figures were in conflict with the 33⅓ per cent recent top-expense ruling of the New York department. However, this is not the case; instead of conflict, there is really harmony. The reason for the apparent difference is that the New York department has included adjustments, investigations, inspections, etc., as "management expense," while these items are counted with "losses" in my own analysis at the beginning of this section (No. 2, A). Secondly, accident and

health, 45 per cent. The commission ordinarily paid to agents for this line of business is 35 per cent; allowing 10 per cent for home office expenditures gives us the total of 45 per cent.

3. These illustrations are deceptive in one way and do not convey my real meaning. It is not my thought that the agents must now and forever receive 17½ per cent for compensation. I merely use this figure as an illustration. I believe that the amount of commissions an agent receives is a matter of contract between the agent and the company. It may be that conditions will change so that the agent should receive a larger commission, or it may be that conditions will change so that the agent should receive a smaller commission. The only stand which I take is that no company should spend more than 30 per cent for the items enumerated in Class D for compensation business; the apportionment of this 30 per cent between agents' commissions and the home office to be left to the company as a matter for its own discretion.

It is not my idea that the agent must now and forever receive 35 per cent for accident and health business. I merely use this figure as an illustration. Conditions may change so that the agent would be entitled to a higher commission, or conditions may change so that the agent would be entitled to a lower commission. My position in the matter is that no company should spend more than 45 per cent for accident and health business, covering the items enumerated in Class D. The exact distribution of this 45 per cent is a matter of contract between the company, its agent, its employes, etc., and is to be apportioned at the discretion of the company.

Further, it is not my idea that these top percentages must be reached. I do not mean that a company must spend 30 per cent for compensation business; on the contrary, I think it should spend less; but, at all events, it must not spend more. I am not trying to say that a company should spend 35 per cent for liability business; what I do mean is that it should try to do the busines for less; but, at all events, it must not exceed 35 per cent.

4. It should be specifically mentioned that these figures are not meant to apply to young companies. Of course, every one understands that it costs more to get a new company started than it costs to maintain an established company. Furthermore, I do not mean that, if a company is spending to-day 51 per cent on accident and health business, it should over night reduce to 45 per cent. This plan, if adopted, must be a flexible one. If a company is spending 51 per cent for accident and health business, it might be allowed three years to reduce to 45 per cent—the reduction to be made at the rate of 2 per cent per year. Thus, if the company is operating at present on a 51 per cent expense ratio, next year it should reduce its expense ratio to 49 per cent; two years hence, to 47 per cent, and three years hence, to 45 per cent. Similarly, if a company is spending 33 per cent for compensation business, it should reduce next year to 32 per cent; two years hence, to 31 per cent, and three years hence, to 30 per cent.

5. As already pointed out in the foregoing, these figures are tentative. I think, personally, they are not far from being correct; but, of course, they are all subject to modification, if there is a concensus of opinion on the subject. Also, I have suggested that every company be given three years to reduce from its present expense ratio to those maximum totals indicated. Possibly the change cannot be made in three years and five years should be allowed. If this is the consensus of opinion, the change is easy to adopt. If any of these changes are desirable, let us make them. However, they are changes in detail and not in principle. The principle I believe to be correct.

To my way of thinking, it is absurd that we should have twenty-nine companies which operate under an expense ratio varying from 50 to 80 per cent and more. No business can stand an overhead burden of this magnitude.

6. Because this suggestion comes from a commissioner of insurance, I presume that it will look as if I were of the opinion that these limitations should be made by the States. This would be a misstatement of my position. My mind is open on the subject. The best way of all would be for each company individually to reduce its expense, for no other reason than that it is good business policy. Perhaps it should be allowed to come naturally as an outworking of economic forces. Perhaps this limitation should be made as an agreement among the companies. Possibly it should be made as an agreement between the companies and commissioners. As a last resort, and if it cannot be done otherwise, it should be done by legislation.

In concluding Part I, I beg again to call your attention to the elasticity of the ideas which have been advanced. The only idea advanced which I regard as being without elasticity is the principle that the expenses enumerated in Class D should have some limitations set on them as applied to the different lines of the casualty business.

PART II.—RESERVES ON RATES.

By Thomas F. Daly.

The object of my discussion is to establish the following: The present method of calculating casualty reserves (reinsurance reserves and loss reserve) is unscientific. Reserves should be based on standard minimum rates, not on premiums.

The principles involved in these branches of insurance indicate the necessity for careful thought regarding what is to be undertaken under such policies, with particular observance of the rights of both contracting parties to the underwriting agreement, always consistent with the requirements of the laws of forty-eight States and two Territories. Reserve on premiums means very little, if anything, when applied to this class of business, as the premium test may be inadequate to maintain the risk on a sound basis, or provide for the losses which may occur.

Reserve on rates necessitates the procuring of sufficient premium to provide a sound reserve. When a proper rate is determined, correct reserves are sure to be maintained. Consequently, safety will be the first order of business, as the reserve under such conditions will always be the equivalent of the loss.

Consider for a moment the conditions under which the companies operate, and the reasons for assuming that reserve on rates is more scientific than reserve on premiums or any other haphazard method. Suits in liability lines are sometimes in court from two to ten years, or even longer. As solvency is the first requisite, thus the company must be fully equipped and ready to serve the public fairly and economically. Hence, if a reserve on rates were once sanctioned by any form of supervision, particularly by the combined underwriters, as being the proper method of providing for liabilities, it would make any company reinsurable that might have to retire from the business, and would place the business on a thoroughly scientific and sound basis. The experience of different companies, as compiled by the Bureau of Casualty Insurance Statistics, which dates back for at least fifteen years, together with the companies' own experience, ought to be a sufficiently safe indication upon which to base rates. It is obvious that, were the reserves to apply to the rates established, no great deviation would occur in the underwriting. If the standard of reserves were adopted by the companies, it would very soon be recognized by the State authorities as being adequate, safe and sound. Experience from time to time would indicate whether or not the rate ought to

be increased or lowered, depending entirely upon changes which might take place in the laws or conditions affecting the business. The plan might easily be applied, as it is at present used in life insurance; and in time it would probably be recognized by State authorities as the present American Experience Tables on reserves are recognized in life insurance.

Further, proper reserves under proper classification would be of untold benefit to the companies; would prevent discrimination and loss on underwriting; would insure a living percentage of profit to the companies, and at the same time a square deal to the public and to the agent producing the business. From my point of view, we do not get anywhere with reserve on premiums. Premiums may be so low that, to obtain the proper reserve, you would be obliged to add something to the premium to provide for the safe carrying of the risk under a scientific rating. This has been more or less true in the past, on account of the unscientific method of reserving and the inadequacy of rates. The pure premium method is all right, as it is the experience of the past, and ought to be a reasonably fair guide by which the proper reserve may be determined under the rate-reserve system in the future.

Rate reserves may be safely applied to any branch of the casualty and miscellaneous insurance lines. At the present time individual accident companies are undertaking to do the business of trust and suretyship. In other words, they guarantee to the beneficiaries of policies payment of installments which are limited only by the lifetime of said beneficiaries.

Policies of accident companies provide payments to the assured under a total disability feature which necessarily makes the companies custodians of funds to be distributed; and they perform an act by common consent which is not contemplated in most of their charters. The present value of all such payments must of necessity be a liability, and should be so treated.

Obligations are created under compensation laws which make the company the custodian and distributor of funds for a certain period, ranging from six to ten or twelve years, and in New York for a period of even thirty-five or forty years. This means that reserves should be computed scientifically; that the funds of the corporation should be properly invested; and that the safe guarantee of rate reserves should be thrown out to the protect the companies against themselves. The duty to be performed under these policies that are being issued to-day involves the same economic principles as are exhibited under annuities which are bought and sold, and upon which the right of contract is always influenced by the amount of assets behind the guarantor.

The necessity for safeguarding the business by proper reserves upon rates is obviously apparent, as accretion or profit by investment is not in any sense a part of underwriting profit, and should not be taken into account. Companies with large accumulated surplus might act in a manner that would be detrimental to younger companies that are starting in the business. With a reserve on rates, it would be impossible for any company to serve the public in a manner detrimental to another company, no matter how small or how young. In this manner the younger company does not suffer by any comparison except that of size; and, as size is not essential to economic service, it makes little difference in the calculations of the service to be rendered, once an average has been obtained. On the contrary, size is sometimes top-heavy, and because of bulk often duplicates itself.

Reserve on rates may be applied to all branches of the business—surety, plate glass, steam boiler, health, burglary, or any of the branches of miscellaneous insurance now written. We are considering the matter from the standpoint of an individual rating for each classification in each different State; as the laws vary, so would the rates vary in each State, and the reserves accordingly, arranged in whatever percentage of the rate appeared to be sound from an economic basis.

We will not quarrel about the percentage of reserve to be set aside and our suggestion is only based upon a theory evolved from consideration of duties to be performed under casualty and compensation policies. Therefore, the table which follows may not be entirely in accord with the views of those who may criticise the method, but the figures may be arranged to fit the actual conditions as shown to be necessary by the experience so far attained.

The rating by States is in no sense different from the plan that is now in vogue; consequently, it would work no hardship upon the companies. The plan for percentages may be worked by a congress of companies represented by their presidents, managers, or statisticians; the suggestion may be worked into rates based upon the best evidence which can be obtained from past and present experience. Changes are feasible at any time when any modification or addition to the laws may be put into effect.

The prime benefit to be derived by the companies and the public from this suggestion is evidenced by the greatest economy and the elimination of waste. Waste does not benefit the public or the companies. Loss to the stockholder is proportionately as great from his point of view as loss to the public by reason of the failure of companies, and having to assume the double burden of paying the loss and the premium also. Therefore, economic waste cannot be counted as a benefit to any one.

Thus, competition is reduced entirely to the best service and not to the lowest premium.

Loading for expense, over and above reserve on rates, is a matter to which considerable attention should be given, consistent with reliable and authentic experience as to what may be necessary to provide the best service. Acquisition expense should be arranged in the best interests of the public, the assured, and the companies, and should be made sufficiently liberal to invite the best service from men of integrity and ability. Generally speaking, the public does not seek this class of insurance. This matter could safely be left to the companies, as competition between them would keep the expense item at as low a figure as is possible to provide proper service. It must be sold by competent and enterprising agents, whose imaginations encompass all the ramifications, conditions of laws, and provisions of policies known to the science of this underwriting. Insurance is dignified, and, being dignified, is of course complicated to the average mind. Being complicated, it requires explanation. Thus salesmanship stands out as the most potent element involved in the underwriting of this class of very important insurance.

Salesmanship demonstrates the use of the insurance; and the need of the agent is so great that argument further on this line is quite unnecessary. Therefore, in compiling tables and arranging loading, the interest of the producer should be safeguarded, because of the old saying that "the laborer is worthy of his hire." Ability is worthy of just compensation.

For purposes of illustration:

Table rate	$1.00
Reserve	0.65

To be increased by specific interest accretions, if necessary.

Company A and Company B are both quoting upon a risk; rate, $1.00. Company A maintains the rate; is in correct position to maintain its reserve also.

Company B cuts the rate of $1.00 to 75 cents. The obligation is the same on Company B as on Company A. This would leave B

only 10 cents for expense, which is inadequate, and the balance for the item would have to be made up out of surplus.

This illustration furnishes the best argument against cut rates. It is short and plain, and unquestionably conveys the idea.

Of course, in all cases where a profit is shown from the reserves, and the liability has ceased under the policies for any period,, and there are no outstanding claims, the reserve may be released into surplus. Thus the matter would equalize itself, and readjustment of the rates would occur every three or five years, or whenever experience indicated that a change was necessary.

The plan, if applied, would furnish a sound basis for rates and reserves for mutual companies as well as for standard stock companies, and ought to be the most conclusive system of rating that has ever been introduced into this class of insurance business.

In conclusion, it furnishes a method by which a proper rating can be had and places the business upon sound scientific basis. It enables the companies to obtain the rate which will provide for the payment of losses in full, and protects the company's solvency by safeguarding its surplus. To the public it gives the assurance of sound protection, without the possibility of failure connected with it, upon which the best service may be performed by the company. Thus the duty to the public will be fully observed. As experience would necessarily demonstrate the correctness of the company's position under the reserve, it would also demonstrate the correct position of the public who are the beneficiaries of the policies.

COMBINATION POLICIES

By Hon. Frank Hasbrouck*
Superintendent of Insurance of the State of New York

GENTLEMEN OF THE CONVENTION:—In recent years there has been a general demand for increased insurance facilities against casualties of all descriptions. The merchant, the manufacturer, the contractor, the householder, the automobile owner, and in fact business men and property owners generally know that it is "good business" to secure protection, through insurance, against loss or damage from the many hazards to which they are exposed. The business man and property owner secures himself and his family against money loss by reason of his death, illness or injury, by securing life, health and accident insurance. He protects himself from loss or damage, whether resulting from injury to person or damage to property, for which he is legally liable, through various forms of insurance. He insures against excess loss caused by giving and extending credit to his customers, against loss by burglary or theft, against loss through damage or destruction of his property, and against loss occasioned by dishonest employes.

The laws of the various States have been broadened year by year, new forms of insurance constantly being provided for. The New York Insurance Department has always encouraged any new form of insurance for which there has been a real public demand and which could be written with safety by the companies. The department has also consistently opposed any form which seemed to be particularly hazardous and against public policy. To cite an example: we recently refused to sanction a proposal for insurance against loss by strikes, believing that considerations of public policy were strongly against such a project.

Under the provision of the New York law, a separation by subdivisions is made, dividing the casualty lines into separate classes. Section 70 provides for the following lines, under subdivisions one to eleven, as follows:

Subdivision 1. Life and health.
Subdivision 2. Accident and health.
Subdivision 3. Clause a. Liability and compensation.
Clause b. Property damage caused by horses or vehicles.
Subdivision 4. Fidelity and surety.
Subdivision 4a. Credit.
Subdivision 5. Burglary, theft and forgery.
Subdivision 6. Breakage of glass.
Subdivision 7. Steam boiler and fly-wheel.
Subdivision 8. Live stock.
Subdivision 9. Automobile, property damage and collision.
Subdivision 10. Sprinkler.
Subdivision 11. Elevator.

A stock corporation may be formed for all the purposes combined, or any two or more of them, specified in the first and second subdivisions and clause "a" of the third subdivision, or for all the purposes combined, or any two or more of them, specified in the second, third, fourth, fifth, sixth, seventh, eighth, ninth, tenth and eleventh subdivisions, provided, however, that policies under subdivision nine shall be issued only by companies authorized to issue policies under subdivisions two, three or five. Credit insurance is not permitted with any other form of insurance unless the corporation was authorized to transact such business prior to June 1, 1905.

While the casualty companies are not permitted to enter the field of fire insurance, nor the fire companies the casualty field, except in a limited way, there has been every disposition on the part of the lawmakers to give the casualty companies wide latitude in their own field. One company, by meeting the legal requirements, may write all lines of casualty and surety business. We have seen the casualty companies entering the surety field, and the surety companies entering the casualty field and there seems to be a general tendency of the companies to branch out and take on all the lines permitted by law.

While the law practically offers no restrictions as to the number of lines one company is permitted to write, strict provisions exist as to the number of hazards which may be covered in one contract. Prior to this year the law provided that no one policy issued by any one corporation should embrace more kinds of insurance than are specified in one of such subdivisions, except that life companies might embrace in one contract all of the hazards they are permitted to write, and companies issuing automobile policies might cover in the same contract health and accident, liability, burglary and theft, and automobile property damage and collision insurance.

During the session of the 1914 Legislature, this department prepared and caused to be introduced a bill, which was enacted into the law, permitting companies to issue to householders one contract covering the assured against employers and public liability, burglary and theft, breakage of glass, loss or damage to life or property caused by boilers or other machinery, damage to property caused by water, and loss or damage to elevators or to other property caused by the operation or use of elevators. Prior to this enactment, in order to insure against these hazards the householder was obliged to secure six separate policies, although all of them might be issued by one corporation. This legislation, in our opinion, is in the public's interest and the owner or tenant of the dwelling who desires coverage for all casualty hazards is now saved the annoyance caused by a multiplicity of policies.

There are various objections that can be urged against the inclusion in one policy of various hazards. The different State departments require the companies to classify their various lines,

*An address delivered before the Forty-Fifth Annual Session of the National Convention of Insurance Commissioners.

showing premiums, losses, reserves, commissions, etc., separately for each line. It is essential to the company's interest that the experience of the various lines be kept separately, for otherwise there would be no means of telling where the profits were coming from, or in arriving at the source of losses in underwriting. The householder's policy is issued at a flat premium, no separation of the premium cost for each line being given in the policy. It has been stated that this form of contract will make it easy for any company to report this business, as between the different classes, in any maner it desires, and further that the anti-discrimination and anti-rebate laws can be evaded by the company writing this policy. These objections were carefully considered before our approval was given to this legislation, and conferences were held with representatives of various companies in reference to them. The officials of the company proposing to issue the householder's policy stipulated with this department that the premiums, losses, reserves, etc., would be properly separated on the company's books and records and so reported to the departments. Our approval was given on this condition. In order to further safeguard the proper conduct of this class of business, the departments should require any company issuing this or similar forms of contracts to file with it the premium charge for same, showing its division into the several classes, notification of any change in the flat rate or any of its divisions to be given. If this business grows to sufficient importance, it might be well to call for a special schedule at the end of each year, showing the year's premiums, losses, reserves, etc., separately by classes. It has been suggested that the company should be required to set forth in the contract, not only the amount of the total premium, but also the premium charge for each class of insurance. I do not believe that this is necessary. The public is only interested in the cost of the policy, and not in the amount of the several items that go to make up this charge. When we know that an actual separation of the gross premium is made by the company, and that we can at any time check the schedules submitted with the records of the company, it seems to me that the supervising officials have at all times the means at hand to see that this class of business is properly underwritten and conducted in accordance with all legal and departmental requirements.

Undoubtedly, there will be further amendments to the law proposed along the same lines and I believe that this is a matter that should have the careful consideration of all insurance supervising officials. While this department is not pledged to any policy that means the destruction of the general principle which allows one policy to embrace but one form of insurance, there are exceptions that seem necessary in order to meet the practical needs of the insurance world, and any modification of the insurance laws necessary for the best interests and convenience of the public will receive the hearty approval of this department.

NOTES ON INSURANCE, AMERICAN AND FOREIGN

Commissioner Winship, of Michigan, Opposed to State Rate Making.—The Chicago correspondent of THE MARKET WORLD AND CHRONICLE, in a recent issue of the paper, had occasion to speak of the somewhat aggressive advocacy on the part of some Western insurance commissioners of the taking over by the States of the whole matter of making fire insurance rates. In the course of the statement the position on the subject of Commissioner John T. Winship, of Michigan, was referred to briefly, and with such turn of the phrase that it might be deduced from it that Commissioner Winship was in substantial agreement with his radical fellow commissioners, though in a modified and less unreserved degree. Commissioner Winship has been good enough to call our attention to this unpurposed misrepresentation of his views; and we are glad to publish in full his letter with respect to the matter. It is as follows:

To the Editor of The Market World and Chronicle:

Sir:—I notice in a recent issue of your journal that in discussing the matter of fire rates, after taking up the situation in Wisconsin and Illinois, and the demands in those States for State-made rates, you say, "Commissioner Winship, of Michigan, is less radical in his demands," but go on to indicate that I am in favor of State rate-making.

I do not know where you have secured information that would justify such a conclusion, as I think I am on record before various meetings of the National Convention of Insurance Commissioners, before various associations in this State, which I have addressed, and in various printed communications, that I am unqualifiedly opposed to the State making rates. My investigations have, however, led me to believe that Michigan ought to have an anti-discrimination law, but that is by no means a law providing for the making of rates. It is merely a law providing that risks of equal hazard and the same situation shall enjoy the same rate. I believe that if we could eliminate the discrimination, much of the complaint against so-called "high rates" would be wiped out. The favors given one client, by permitting him an excessively low rate, must, of necessity, be made up by another client, who is saddled with an excessively high rate, and my whole idea is to equalize these rates. The risks are the same and certainly no one of the old guard could take exception to that.

I am absolutely opposed to the State entering the fire insurance business, or any other business, and if we can wipe out discriminations, we will wipe out much of the agitation for State insurance and State-made rates. Very truly yours,

JOHN T. WINSHIP,
Commissioner of Insurance.

Lansing, Mich., August 31, 1914.

Life Insurance Companies and the Cotton Situation.—Following close upon the prposal of President Wilson, of the International Life, that life insurance funds should this year be used to carry the surplus of our cotton crop, comes the announcement that the Pan-American Life has another scheme for helping the Southern cotton farmer in the hour of his need. In an announcement made public after a conference with Insurance Commissioner Collier, of Texas, last week, President Wilson stated that if a suitable law was enacted by the Texas Legislature assuring that cotton will be stored and safely held as long as necessary, he would be glad to bring the matter to the attention of the executive committees of the American Life Convention, the Association of Life Insurance Presidents and the National Association of Insurance Commissioners with a view of bringing about an agreement for each life insurance company to invest a certain percentage of its surplus in stored cotton secured by warehouse receipts. He said further that the underlying motive would be to render a public service, and that the greater number of people to be benefitted, the greater the incentive to the companies to lend a helping hand.

President Ellis, of the Pan-American, has just issued the following letter to the policyholders and field force of his company:

Dear Sirs:—In order to assist the farmers in the cotton-growing States during the crisis caused by the European War, which has seriously interfered with the disposition and financing of their cotton crops, the Pan-American Life Insurance Company has decided to extend to said farmers the privilege of paying their life insurance premiums by notes secured by cotton in warehouses, at

such amount per bale as may be agreed upon from time to time, as conditions warrant.

Such action on the part of the Pan-American Life Insurance Company will enable the policyholders of the company to pay their renewal premiums, and the agents in the field to insure the lives of their prospective clients, and take, in payment of the premium, a bale of cotton or so many bales of cotton as may be necessary to cover such premium as the policy may call for, and at such price as may be agreed upon between the agent and the owner of the cotton, the agents, in turn, arranging with the company to advance them the necessary cash on said cotton to pay the net amounts to the company, and leave them a sufficient margin to conduct their work.

In order to handle the matter in a practical way, it is suggested that, in handling a transaction of this kind, the owner of the cotton be first required to place his cotton in a responsible public warehouse, and have the warehouse issue him a receipt therefor, stating the grade of the cotton and the weight thereof when stored. This receipt can be used to secure loans from the company for the payment of renewal premiums, on the form of note shown on the following page.

This same form of note may be used by the agents, in obtaining a loan from the company to finance themselves and continue their work.

We believe that it is the duty of every individual and corporation to assist in handling the cotton crop as much as possible, and make it a commodity with a purchasing power for practically everything needed by our people, and if such a policy is carried out by all at interest, we feel quite sure that the cotton crop of the South will be marketed, and serve to perform practically the same purpose in the commercial world as it would if it were readily saleable for cash. Yours very truly,

CRAWFORD. H. ELLIS, President.

The Cost of Patriotism in the United States.—Some interesting (and appalling) statistics have been issued in the annual report of the "Journal of the American Medical Association" on the number of deaths and injuries resulting from Fourth of July accidents throughout the United States during the past twelve years. From the following table it may be seen that, although our annual human sacrifice to patriotism is decreasing and although the agitation for a safe and sane Fourth is having most beneficial results, we still suffer a greater number of casualties on one day each year in the celebration of our National independence than we suffered in our entire struggle to gain the freedom of Cuba and the Philippines from Spain in the Spanish-American War.

FOURTH OF JULY CASUALTIES, 1903-1914.

	Deaths.	Injuries.		Deaths.	Injuries.
1903	466	3,983	1910	131	2,732
1904	183	3,986	1911	57	1,546
1905	182	4,994	1912	41	947
1906	158	5,308	1913	32	1,131
1907	164	4,249	1914	40	1,466
1908	163	5,460			
1909	215	5,092	Totals	1,832	40,954

This year three little boys died from tetanus (lockjaw); sixteen persons, mostly little girls and small children, were burned to death by fire from fireworks; five persons were killed by firearms; six by explosions of gunpowder, guns or torpedoes; four by cannon, and five died from blood poison resulting from injuries caused by fireworks. Among those injured but not killed, thirty-six were totally blinded, thirteen lost one eye each, sixteen lost legs, arms or hands, and sixty-seven lost one or more fingers.

There may be added to this the statement of the Weekly Bulletin of the New York City Department of Health which says that, this year, conforming to annual custom, hospitals, supply stations and department of health branch offices, were provided with tetanus antitoxin to be employed as a preventive measure in cases of gunshot and firework injuries. During the period extending from June 28 to July 15 a total of 124 prophylactic injections of tetanus antitoxin were administered by department of health medical inspectors, hospitals and private practitioners. How many prophylactic injections made with antitoxin secured from sources other than the department of health were administered, it is manifestly impossible to ascertain. Parenthetically, it may be of interest to note the number of Fourth of July accidents as recorded by the police department of the city:

	July 4, 1914.	July 4, 1913.
Males injured	159	164
Females injured	43	36
Totals	202	200

Tendencies as to the Public Demand for Various Forms of Life Insurance Policies.—The Travelers Insurance Company, in its "Agents' Record," has made an interesting tabulation of its experience with various kinds of life insurance policies. We give its statistics and the conclusions drawn therefrom below:

A careful consideration of general basic tendencies on the part of the insuring public is essential to successful solicitation and the agent who bases his plan of campaign in accordance with such tendencies will avoid many obstacles, simplify his problems and find himself in co-operation with the attitude of the great mass of prospects.

Study of the following table shows that, the average size of a life insurance policy is directly dependent upon the premium charge. The lower the premium charge per $1,000 the larger the amount of insurance. The consistency in this respect among all the various forms of policies is most marked. It shows why the average size of the Guaranteed Low Cost policy is greater than the average amount under the participating forms, and that so-called dividends of participating policies are at the cost of the insurance proper.

TABLE SHOWING AVERAGE AMOUNT OF INSURANCE AND AVERAGE AGE ON CONTRACTS OF THE TRAVELERS INSURANCE COMPANY PAID FOR IN 1913 REMAINING IN FORCE AT END OF 1913.

Kind.	Number Policies.	Amount of Insurance.	Average Amount.	Average Age.
Life	3,468	$12,000,296	$3,460	36.91
20 payment life	5,301	11,902,573	2,245	30.44
Other life	220	597,336	2,715	35.40
Endowment less than 20 years	321	685,369	2,135	35.85
20 year endowment	2,870	4,181,308	1,457	27.64
Endowment more than 20 years	126	312,108	2,477	26.46
20 payment life with G. E. A. and endowment accumulation, Ohio	2,463	4,474,350	1,817	27.44
Insurance to 65	626	1,607,700	2,567	33.54
Joint policies	226	705,877	3,123	33.38
Reversionary annuities	7	42,910	6,130	39.86
Other forms	94	358,000	3,809	36.82
Totals	15,722	$36,867,827	$2,345	31.24
5 year term	1,656	7,694,351	4,646	35.44
10 year term	713	2,457,253	3,446	34.80
Totals	18,091	$47,019,431	$2,599	31.77

INSURANCE NEWS IN THE WEST

The Fire Insurance Situation in Illinois as the Insurance Men See It.—The fire insurance situation in Illinois, resulting from the anti-trust suits inaugurated by Superintendent Potts, is taking on a rather ugly aspect. It was hoped for a time that a compromise might be effected, but last week Mr. Potts told a committee of the State Association of Local Agents that the time for compromise was past; that the suits would be prosecuted, the advisory inspec-

tion bureau put out of business and a commission to review rates on complaint would be established. The members of the agents' association have been working with Superintendent Potts in his fight on annexes and relations have been very friendly. The anti-fight on annexes, and relations have been very friendly. The anti-ficial and the agents, but are causing them much worry; in fact there was an expression at the convention at Springfield last week of the belief that fire companies might suspend operations in the State just as they had done in Missouri and Kentucky. Such a contingency was mentioned in a discussion between a committee of local agents and the Superintendent. In substance, he replied that any company which took its feet off the sacred ground of Illinois, would find the entrance blocked when it desired to return. Local agents called attention to the fact that such statements have a most familiar ring, recalling similar assertions made by Superintendent Revelle, of Missouri, and Ruby Laffoon, chairman of the Kentucky State Rating Board.

When the agents gathered in their annual session, there was current a belief that Superintendent Potts and Governor Dunne thought that the agents were back of them in their anti-trust litigation. To disillusion these officers and, possibly with a hope of getting the Superintendent to withdraw the cases, the resolutions committee was sent to the State Capitol for a conference. They presented the resolutions approving the anti-annex order, but condemning the anti-trust suits. They were told that the Superintendent was always glad to see them, but all of their argument made no impression upon him; that he was committed to the course on which he had started and could not back up. It is felt by many that Governor Dunne does not realize into just what complications these actions may rush his administration.

There was considerable talk at the agents' meeting concerning the help Superintendent Potts is said to have received from certain local agents at Springfield, Ill. These agents, according to rumor, have been promised places on the Superintendent's proposed commission at good substantial salaries. There is considerable feeling against these local agents on the part of other local agents and companies

One of the strongest arguments against the suits was presented by C. F. Hildreth, of Freeport, Ill., president of the National Association of Local Insurance Agents. He had arrayed all of the arguments for co-operation in rate-making, and against what many novices are led to believe is open competition. In the arguments, among others, it was also pointed out that the Democratic administration at Washington is doing everything possible to bolster up business and credits, while the Democratic administration in Illinois is attacking the very foundation of commercial credits.

Insurance men believe that Superintendent Potts is inspired by political rather than public interest. He has frankly admitted that his ambitions do not lie toward wealth and his career has proven that they do take a political trend. The suits were brought just before the Illinois primaries, when the faction of the Democratic party to which he and Governor Dunne belong needed some good thunder. The rumbling was not sufficient, however, as the Sullivan faction was an easy victor. There is little question but that the Sullivan Democrats will be strong in the next Legislature and, if they combined with the Republicans and Progressives, could prevent the confirmation of Mr. Potts.

* * *

New Agents' Organization in Minnesota.—Nearly a hundred Minnesota insurance agents, representing all branches of the business, met in Minneapolis last Friday and organized the Insurance Federation of Minnesota. The attendance might have been larger but for the fact that the committee that initiated the movement deemed it advisable to solicit the assistance only of a limited number, all believed to be interested, to attend the organization meeting. W. S. Diggs, of Cincinnati, president of the Ohio Federation, was present and made a strong speech pointing out the desirability and, in fact, the necessity of taking action. Other good speeches were made, one by Charles R. Fowler, a member of the Minnesota Legislature. A good-sized sum was pledged for immediate expenses and organization work on a large plan will be inaugurated at once. Not only will insurance men be solicited to join, but policyholders will be urged to come in also, the strength of the federation movement depending largely upon the co-operation of those who pay the premiums. W. A. Fricke, former Insurance Commissioner of Wisconsin, sent a letter stating that a similar movement would be started in his State very soon. It is expected that the Iowa agents will also start the organization of a federation after their representatives return from the White Sulphur Springs convention.

* * *

Prospects for Casualty and Surety Agents' Meeting.—Wade Fetzer, of Chicago, will not be a candidate for re-election to the presidency of the National Association of Casualty and Surety Agents. In an announcement made this week, he said that he believes it is to the best interest of such an association that there be frequent change of officers, with the resultant infusion of new blood and new interest into the organization. He will recommend in his address that the association establish a precedent that no officer may be a candidate to succeed himself. Prospects for attendance at the meeting at White Sulphur Springs next week look good in the West. There will be a considerable crowd from Chicago. Missouri will send about twenty-five persons, mostly from St. Louis. Michigan expects its delegation to number a dozen or so. Cleveland people had made reservations enough to fill one car a week or two ago. Other parts of the West will send a fair number.

* * *

Western Organization of Hartford Accident and Indemnity Completed.—The Western department of the Hartford Accident and Indemnity has now virtually completed the staff of its Chicago office and is ready for active development work. The general plan to be followed will be to appoint general agents in the large cities, each in charge of one or two counties. These will report to the home office. The agents in the smaller cities and towns in States adjacent to Illinois will report to the Western department and be supervised by it. While, of course, full consideration of Hartford Fire interests will be given in the appointment of agents, special attention will be given, where possible, to securing connections that will give the company a volume of business in the minor casualty lines rather than employers' liability or compensation business only.

* * *

The Present Situation as Affecting Workmen's Compensation Business.—The workmen's compensation business seems to be differently affected in its different branches by present conditions. In Detroit, where there is a great manufacturing business, general agents and branch office managers are putting on more special agents in preparation for an increase in business which they expect because of the general business revival. On the other hand, one large general agency in another Western city is suffering some reduction in business because of a slowing down in the contract line, due to the disturbance in financial conditions caused by the European War.

REVIEW OF THE FINANCIAL SITUATION

IT is coming to be seen more clearly that in all countries the war is going to spell more or less extensive hardship for the masses of people and that it has made obligatory a return to the cultivation of the virtues of frugality and thrift which, plus the concentrated direction of human energy toward the accomplishment of seeming impossibilities are, in the last analysis, going to enable us to recover some day the state of prosperity which the war has destroyed. Such a return to the old homely elements which constitute the foundations of prosperous achievement cannot be considered as undesirable. On the contrary it has long been manifest that civilization was extravagantly wasting its substance and it may perhaps be accounted to the good of the war that it has so changed circumstances for most of us in respect to income and expenditure that the thoughts of all must turn from extravagance to economy.

Only through such a change in attitude with its consequence in effort, can there be adequate provision of capital to replace the terrific losses of the war; and it is one of the encouraging signs of the moment that the economies which will eventually fill the reservoirs of capital have already begun. For several years past it has been only too evident that the world was straining credit excessively because the demand for capital outran its supply, and this was one of several features of an economic situation which made careful observers apprehensive of precisely such a disastrous political reflection as the general war now raging in Europe. However, economy induced by the war will not only in time repair the wastes of war, but the practice of economy will persist until the stores of capital have been replenished to an extent exceeding the demand. Then barring accidents the world will once more go through the familiar cycle of boom, strain and collapse.

On all sides it is now recognized that the economic emergency with which the United States is confronted on account of the war is grave. This recognition is a far more hopeful token than the over-confident assumption which prevailed so widely in August that American trade, industry and finance would forthwith proceed to develop enormous activity at home in order to go abroad and supply hungry markets with the staples, manufactures and funds which Europe could no longer furnish. Week by week American values have depreciated and the movement of general business has become slower and more contracted, while the domestic money market has become tighter and tighter. Distress, not comfort, lies immediately ahead of us, for it is now known that only very slowly, carefully and gradually can the colossal economic difficulties of the war be overcome by us, unless recourse is had to dangerous expedients which may stimulate a violent and feverish recovery and expansion to be followed by a fearful all around smash because the whole movement was artificial.

If our leaders of affairs, governmental, financial and commercial, do not lose their heads and do not surrender to violent clamor for the employment of devices intended to do that which cannot be done, namely, to prevent us from bearing our share of costs of the war, the resources of the United States are ample to bring us through this trying period without incurring stupendous liabilities toward the future. It is conceivable that we may have yet to do what other great nations have had to do in this emergency. We may have to set up some kind of a moratorium. We may have to go on a paper money basis, but all endeavors should be engaged to the utmost to avert anything of the kind. If we are to save ourselves from employing these desperate shifts we can only do it by swallowing the dose of trouble which the war has administered, and restraining all impatient dispositions to regain in a hurry that which has been unquestionably lost for a prolonged season, a state of prosperous general welfare.

There is encouragement for all of us in the perplexing junctures of the times that already progress has been made by slow and orderly ways to an ultimate restoration of the international exchanges to something like their wonted ability to accommodate commercial and financial operations. At the outset of the war the first thing to be done was to end the deadlock in the international money market, caused instantly by the declaration of hostilities, and in the lapse of seven weeks' effort to loosen up foreign exchange has been measurably successful. Without recounting all the steps that have been taken it suffices to say that demand sterling was this week carried below 4.96, and if in the course of the next few weeks it can be brought down to about 4.90, the level will be regarded as relatively normal for war times or at least for the early stage of the war abroad. On such a level financial activities will expand in volume and the international monetary position will have a favorable reflection on the domestic money market, and, consequently, on all American trade, domestic and foreign. The improvement which is painfully working out in foreign exchange is distinctly worth noting, not only because it is directly encouraging, but because it points the conclusion of our argument that with patience and persistence we can overcome all the obstacles which the war has placed in the path of American enterprise.

Thanks very largely to the intelligence and effectiveness of the measures resorted to by British finance the London money market has week by week gotten into better and better shape. This means that in the course of time monetary obligations wherever owing can be liquidated with increasing facility and ampler supplies of credit can be granted. The Bank of England in its weekly return on Thursday reported a further rise in its reserve ratio, which is now 6 points above the low figure reached in the first fortnight of August. Already the London financial community is busily engaged with a consideration of the problem of resuming business in the world's primary security market, and if British finance can see its way clear to reopen the London Stock Exchange in the near future assistance will be given thereby to undertakings in this country looking toward the lifting of the embargo on those activities with which the name of Wall Street is chiefly synonymous.

Until the securities markets are reopened for regular transactions financial and business improvement under the circumstances of war can go only just so far. Capital is frozen up in the stock exchange suspensions here and abroad and without the movement of capital enterprise must languish. More than that, banking positions are heavily involved in the tie-up of funds to an enormous amount through loans on collateral security, and the strain in our own

money market is probably increasing rather than diminishing because the liquefying facilities which the securities markets supply for the money market are lacking. Shrinkage in the quoted values of securities must be counted upon whenever a resumption of trading is made, but untoward effects of this can be guarded against. So also can buying power be rallied to the support of values against the pressure of foreign liquidation of American securities which must be expected.

The really difficult knot in the problem is the method of paying Europe for the hundreds of millions of dollars of American securities which we will have to repurchase, but students of the problem are satisfied that the knot is one which can be untied. Help will undoubtedly be rendered if foreign exchange conditions approach anything like customary freedom of credit creating processes and if the London Stock Exchange is able to reopen. There are those also who believe that an American bill market can be rapidly developed which will furnish credit instruments, that is dollar exchange, in a large enough supply to supplement sterling exchange to accommodate trans-Atlantic transfers of securities with very little use of gold.

The New York City $100,000,000 6 per cent loan, to the public offering of which at par a gratifying response has been made, was a factor in the foreign exchange betterment. On account of the loan nearly $7,000,000 gold was sent to Canada this week to be credited as Bank of England reserve, and the evidence that American obligations abroad were going to be liquidated to the extent of our ability promoted London financial confidence in the American position. The Eastern railroads have filed a petition with the Interstate Commerce Commission for the opening of the Eastern rate case, and if the authorities act promptly and show a constructive attitude toward the railroad industry, additional support will be given to the structure of American values and thus conduce to the lessening of financial strain as well as to preparations for the fuller resumption of ordinary activities. The August foreign trade statement was an emphatic revelation of the damage which the war is doing to us and of the difficulties to be surmounted. Imports have been falling rapidly this month and exports have been rising so that our circumstances are not so bad as the August exhibit would sugegst, with its decrease of over $8,252,000 in imports, while exports fell $77,571,000. Still we will have a long way to go to derive much benefit from external commerce.

COTTON

September 19, 1914.

THE days go wearily by for the cotton trade and still there is little sign of the opening of the cotton exchanges or of the beginning anew of the cotton business, as that has been known to persons active in the trade. The cotton crop is being picked and ginned, though apparently more slowly than usual; but the demand for cotton is now so greatly exceeded by the known supply that prices reflect, not a market value based upon estimates of the ultimate balance between supply and demand, but such value as may be arrived at between buyers and sellers of small lots in the various sections of the South. American spinners alone, unless perhaps to a moderate extent the Japanese, are actually in the market for cotton; the amount going into export for Europe is so insignificant as hardly to be worth counting; and it is only the tenacity of the Southern farmer in his purpose not to sell his cotton at so low a price as he can now get, that prevents complete demoralization of the Southern markets. This tenacity is for the moment sufficient to make it almost as difficult to buy cotton as to sell it. Scattered lots can be picked up at from 7½ to 7¾ cents for Middling in the interior and at from 8 cents to 8½ cents at the larger concentrating markets, especially the Gulf ports. But these figures have no significance as criteria of the real market worth of cotton. Nobody knows what that is, and consequently nobody in the trade dares to buy any cotton beyond enough to fill an occasional mill order. As the cotton exchanges are closed, hedging is out of the question for cotton merchants; the accustomed basis of their credit with the banks is non-existent and the banks, very naturally, are unwilling to loan to merchants in the usual way. They may extend credit to a producer on a few bales of cotton, knowing him to be good for the debt because of his property other than cotton. But the thousands of bales which single merchants have been accustomed to carry on bank-loans, with a margin of total assets over total liabilities of only 10 per cent or so, are to-day virtually impossible to borrow upon at any price. Thus the vast absorbing power of the cotton trade has been for the time being destroyed, and the burden resting upon the producers and upon the few persons here and there who make it a practice to buy some cotton when it is cheap, is increased by so much. The unwillingness to have outstanding loans upon cotton in the ordinary course of trade, where it is known that the margin of safety consists only in the capital which the trader or merchant himself commands, is felt throughout the entire banking system. Even the Northern banks, which in previous periods of panic or financial stringency, have made every effort to provide Southern banks with the largest possible supply of funds with which to finance the cotton crop and get it moving towards its ultimate destination, are now hesitant about sending their Southern correspondents any money at all to be loaned on cotton. On the other hand, every day sees a new brood of projects hatched for taking care of the surplus cotton, enabling it to be held for better prices, whether by the producers, or by local agents, or by speculators of the "buy-a-bale" class, or by the States or by the National Government. Various large corporations (not cotton manufacturing concerns), whose business is extensive in the South are also announcing that they are preparing to buy and carry lots of cotton of greater or less size. Even some insurance companies, as is indicated on the first of the pages of this paper devoted to insurance, are seeking to obtain the permission of insurance authorities, or, in the case of surety bonding companies of the Secretary of the Treasury, to hold among their assets a certain amount of cotton. One Southern life insurance company has announced that it will take notes, with cotton as collateral, in payment of premiums, whether for old or for new policies. While the enthusiasm of these projects is fresh and undismayed, it is not at all impossible that for a time they may afford a market for a very respectable amount of cotton. No experienced cotton man, nor, indeed, any experienced student of markets, can believe that these expedients are of other than a purely temporary character or that, in default of more fundamental remedies, they will have any other result than to aggravate the evil they are intended to alleviate. The farmers can really do much, if they will continue to sell their cotton slowly. The cotton trade can do more, as soon as it can get its present commitments liquidated without ruin and can take up once more its task of finding outlets all over the world for the cotton of the United States. The banks will speedily regain confidence in the loaning value of cotton, if they see a real market for it, representing a true meeting of the minds of the producers and the consumers represented by the cotton trade, as to the price. Immediately encouragement would be felt by these three elements, which in the last resort have got to solve the problem, if the Treasury Department and the Federal Reserve Board could arrive at something determinate with regard to the assistance from them that may be counted upon by all. Yet it must be confessed that one of the three elements,—in some respects the most important,—has much to do before it can freely begin the real business of finding markets for this year's crop. It is probably more than conservative to say that the cotton trade of the United States and England, taken as a whole, has lost in the past three months more than 10 per cent of its entire capital, and still has on hand a very considerable quantity of unliquidated commitments, upon which a loss, still impossible to compute, must be taken. Evidently, until the full extent of the losses is known and, above all, the full list of the incapacitated concerns has been ascertained, so that mutual credit may be restored, the cotton trade cannot be counted upon for the exercise of its usual energies.

THE CONTRACT MARKETS

THE NEW YORK COTTON EXCHANGE.

The following were the high, low and closing bid prices for each delivery, on Friday, July 31, in cents and hundredths of a cent per pound, gross weight:

The MOVEMENT OF THE AMERICAN CROP.

The American crop year has been changed to run from August 1 to July 31, and all comparisons are made up accordingly.

The following tables, derived from the New York Cotton Exchange, show the movement of the American cotton crop for the past week and since August 1, 1914, with comparisons for previous years:

CROP MOVEMENT INTO SIGHT.

Weekly Movement.	1911-12.	1912-13.	1913-14.	1914-15.
Port receipts	328,927	269,897	333,204	68,985
Overland to mills and Canada	1,313	718	3,430	471
So. mill takings, est., exclusive of takings from Southern ports.	50,000	50,000	50,000	25,000
Gain of stocks at interior towns	51,029	37,625	27,753	45,871
Brought into sight for week	431,269	358,240	414,687	140,327
Total Movement—				
Port receipts	1,033,470	820,832	957,511	190,755
Overland to mills and Canada	12,811	14,499	25,483	5,922
Southern mill takings	177,032	150,873	189,196	48,000
Stocks at interior towns in excess of Sept. 1	104,232	76,247	37,649	68,012
Brought into sight thus far this season	1,327,545	1,062,451	1,210,439	312,689

The total crop movement is respectively for 53 days, 51 days, 50 days and 49 days.

CENSUS BUREAU REPORT ON CONSUMPTION AND DISTRIBUTION OF COTTON IN AUGUST.

On Monday, September 14, the United States Census Bureau issued its monthly report (the twelfth of the season of 1913-1914) on the consumption, distribution and supply of cotton in the United States for August, 1914. The figures, with comparisons for August, 1913, are given in the following tables,—round bales being counted as half-bales and bales imported from foreign countries being reduced to equivalent 500-pound bales (net weight):

CONSUMPTION AND ACTIVE SPINDLES IN AUGUST.

	Consumption		Active Spindles	
	1913, Bales.	1914, Bales.	1913, No.	1914, No.
In mills in the Cotton States	230,801	198,820	11,973,633	12,016,959
In mills in all other States	201,549	185,385	18,628,649	18,332,943
Totals for United States	432,350	*384,205	30,602,282	30,349,902

*Includes 14,390 bales of foreign cotton.

CONSUMPTION FOR TWELVE MONTHS ENDED AUGUST 31.

Total imports	227,645	280,290	Total exports	8,800,966	†8,914,548

†Includes 259,881 bales of linters.

The consumption of linters in the United States during the twelve months ended August 31, 1914, was 306,291 bales, as compared with 303,000 for the corresponding period of 1912-1913.

NEW YORK COTTON EXCHANGE GENERAL SURVEY OF THE COTTON CROP OF 1913-1914

THE annual statistical summary of the commercial crop of American cotton for the season 1913-1914, issued by the New York Cotton Exchange, is prefaced by the following résumé of the salient features of the year by Superintendent William V. King:

* * *

The cotton crop of the United States for the year 1913-1914 counts up 13,921,303 bales. Add to this the production of cotton linters, i. e., 631,153 bales, giving a total of 14,552,456 bales, the largest commercial crop produced except that of 1911-1912.

The crop had a late start partly owing to drought in portions of the Atlantic States in May, but the favorable weather conditions during the months of June and July following did much to bring the crop forward, especially in the region east of the Mississippi. A drought prevailed during August in portions of the territory west of that river, notably in Oklahoma and parts of Texas, which reduced the yield in the sections affected. Storms, which later swept over the South injured the open cotton and resulted in lowering the grade of a considerable portion of the crop. An early frost throughout the cotton-growing region, practically put an end to the crop growth.

As a result of the early frost many immature bolls of cotton failed to fully open. Formerly such bolls were regarded as of no value, but more recently, stimulated by the high price for cotton, machinery has been devised for the thrashing out the seed cotton contained in such bolls, this is afterward ginned and baled. Approximately 320,000 bales of "Bolly cotton" is included in this crop. Its value depends largely upon its character.

The price received for cotton during eleven months of the year (until the outbreak of the war in Europe) was on the whole satisfactory.

With the exception of the yarn mills, the cotton manufacturing trade in the United States was fairly good, down to and including June, after which date our reports from the mills indicated a marked falling of fin the takings. The trade in Manchester, England, throughout the year was less favorable.

The foreign exports for the season amounted to 8,865,936 bales valued at $531,956,160 based on twelve cents per pound, vs. 8,633,488 bales exported last year and valued at $518,009,280. Linters exported this year based upon a value of three cents per pound amount to $3,975,000; last year their value was included in the ex-

(Continued on Next Page.)

NEW YORK QUOTATIONS FOR STANDARD COTTON GOODS AND YARNS

The following are quoted prices in the New York market for typical standard cotton goods (in cents per yard) and cotton yarns (in cents per pound) on Saturday of last week and on Wednesday of the present week:

Cloths.	Saturday.	Wednesday.
Print cloths, 28 in. 64 x 64s	3⅜	3⅜
Gray goods, 38 in., standard	4¼	4¼
Brown sheetings, Southern standard	7½	7½

port figures given above. The outbreak of the European War has practically paralyzed trade and put a stop to exports during the month of August.

The growth of Sea Island cotton this season has amounted to 77,563 bales. While this shows an increased yield over last year, the acreage in Sea Island of late has been gradually reduced. Counties which formerly produced only Sea Island cotton, now produce three-quarters Upland cotton and one-quarter Sea Island. The demand for the latter is slow, while Upland cotton sells readily, hence the change.

Linter cotton, now produced in such large quantity, is no longer counted by some statistical authorities; its use, however, for manufacturing purposes in increasing yearly. Approximately 298,000 bales were, this season, consumed in the United States, of which 96,135 bales are included in the figures of takings by Southern mills. Linters exported to foreign countries this season practically amount to 265,000 bales.

Making due allowance for the low grades forming part of this season's crop, twelve cents may be considered a fair average price upon which to base the value of the cotton crop,

this would yield	$835,278,180
Include linters, at 3c	9,467,295
or a total, of	$844,745,475

This total does not include the value of cotton seed.

The imports of foreign growths of cotton into the United States to July 31 were approximately 253,202 bales of which 133,025 bales were Egyptian, 19,940 China, 12,070 Peruvian, 88,167 Indian and other growths. The imports for August will doubtless be small. Of these importations, approximately 12,000 bales were consumed by Southern mills and 175,000 by Northern mills.

By resolution of the Convention of Exchanges held May 4, 1914, at Augusta, Ga., a change of the cotton year was recommended, i. e., to begin August 1 and terminate the following year July 31, instead of September 1 to August 31, as heretofore. The New York Cotton Exchange having agreed thereto its statistics beginning 1914-1915 will be issued accordingly. This change was deemed desirable in view of the earlier growth and marketing of the crop, and the further reason that the receipts of new cotton in August should be counted in the new crop year.

The following table shows the source and extent of the year's demand, with figures of last year for comparison:

	This Year.		Last Year.	
Southern mill takings	3,037,061		2,939,049	
Northern mills and Canada	2,615,282		2,596,928	
		5,652,343		5,535,977
Exports to Great Britain	3,418,953		3,604,147	
France	1,058,705		1,008,416	
Germany and Continent	4,013,431		3,608,993	
Mexico	28,007		24,264	
Japan, etc.	346,840		387,668	
		8,865,936		8,633,438
		14,518,279		14,163,465

To the officers of the different exchanges, and to the various railroads and other officials who have kindly and unremittingly furnished to us the required information of the movement of cotton during the past season, we wish to express our sincere thanks. The Southern mills have also been most courteous in giving such full and complete returns that we are confident the statement of their takings during the season is more complete and accurate than ever before. For this result, I am especially indebted to Lewis W. Parker, Esq., of South Carolina, and J. E. Latham, Esq., of North Carolina, and E. H. Inman, Esq., of Georgia.

W. B. MARSH, Business Manager

THE now apparently assured success of the plan to raise a fund of $100,000,000 in gold, wherewith to protect the maturing indebtedness of the United States in London, should be a cause of rejoicing to every American who finds his business restricted or blocked, not by reason of the lack of actual demand for the goods or commodities he produces and sells, but because of seemingly intangible, yet none the less unbreakable fetters upon the distributive instrumentalities upon which he has come to rely. There is only one way to break these fetters, and that is to provide the gold necessary to set in motion again the machinery upon which the world now relies for its economic processes. This machinery is credit; and the place where this machinery is controlled is London. Within and without the United States the production and distribution of goods has during the past half century grown to be entirely dependent upon the machinery of credit. Moreover, this credit is multitudinously over-lapping and catenary in character, in so far as the business world is concerned. Only at the two ends of the line,—i. e. with the producer of raw materials and with the ultimate retail buyer,—does actual cash come into play. When a hundred bales of cotton start on their way from the farms where the cotton was produced, cash is paid for it; when, in its manufactured forms, it is bought by the ultimate consumer, cash is paid for it. But in the long journey it makes from producer to ultimate consumer, no cash whatever, but only credit, is used in connection with it. More than this, the credit employed is not that of a single individual or great corporation attending the commodity from the beginning to the end, but the successive credits of a long series of merchants, manufacturers and distributers of goods, wholesale and retail, each one of whom is dependent, for the liquidation of the credit he has obtained and employed, upon the successful liquidation of the credits of all those ahead of him in the series. To a very large extent the merchant or manufacturer or distributor depends upon getting his part of the merchandizing, manufacturing and distributing process completed in so short an interim of time as to enable him to liquidate his account with the man before him by means of the credit which he got, on delivery of the goods, from the man immediately in front of him in the chain. Hence, if there is a block or hold-up at any point along the line, so that the liquidating process from those ahead to those behind is stopped, everything is immobilized; none in the series can do anything, because, for the time being at least, he has not the wherewithal to continue his operations. Nor does the potential consumption, or average requirement of the world for the commodity in question make any difference, until the congestion has been somehow relieved. From first to last in the economic series, all are unable to obtain payment for what they sell; and consequently they are unable to buy from those who constantly sell to them. The greatest immediate sufferer is, of course, the first seller, commonly the producer of the raw material.

It is, of course, only natural that people in the United States should be thinking mainly of their own commercial and financial troubles, and giving little heed to the embarrassments of other countries all over the world whose problems are of precisely the same character as ours, even though the agricultural and commercial products about which the problems hang are not the same. Here in the United States, as is well known, it is the impossibility of marketing our cotton crop at the very time when it is customarily harvested and sold by its producers and when the money obtained from the exported portion of it is counted upon by all concerned with our international credits as a means of making the annual liquidation of the same, that appears to present an almost insoluble puzzle and to threaten widespread impairment of our financial and credit resources. But for the fortunate fact that our production of foodstuffs this season has been abnormally large, and that we have been able to export our surplus at a very high price, simply because the belligerent nations of Europe dared not hold off from adding this surplus to their stores, the international financial complications that would have been caused us by the virtual cessation of our cotton exports would have been so great as perhaps to have weakened us, in a credit sense, for years to come. Despite our apparent opportunity, owing to our neutral position, to concentrate in the United States some part of the vast sum of international credit operations, we might have found ourselves so discredited the world over as recalcitrant debtors that none would wish to come to us with their business.

This is what we, here in America, see and are concerned with. But the truth is that our case is no worse than the case of numerous other countries which are largely dependent upon one or more commodities, extensively produced by them, for the annual liquidation of their international balances. Thus, for example, there is at this moment in New York a representative of the wool-growers of Australia, seeking to find a market for as large a portion as possible of the clip of fine wool which is just ready for the market. As everybody knows, the production of wool has everywhere been diminishing of late years, both relatively and absolutely. Australasia is the one remaining important source of supply. Prices for this wool have been steadily rising for a number of years past. There is not the slightest doubt

that the world's need of this wool is greater than ever it was, and that, if there were any way open to move it to the consuming countries upon the customary credit arrangements, the demand for it would be eager and the price would be high. Within no long period, either the old machinery will be in operation again or new machinery will have been devised for the distribution of this wool. Then the price must again advance, and rapidly advance, to something approaching its former level, for that level represents the present cost of production of such wool. Yet to-day the Australians cannot sell their wool at all. They do not even dare to hold the usual September and October auction sales, at which a large portion of the clip is annually sold. They fear, and no doubt rightly, that the inabilities of buyers would result in prices so low that great numbers of the sheep-raisers would be ruined and perhaps a financial crisis developed throughout Australasia. Meantime, Australia has no means of paying its debts to England and to other countries from which she has bought necessities and luxuries. The public authorities hardly know which way to turn to meet the interest requirements upon the large sums that have been borrowed in London for public improvements and other public projects. Bills of exchange upon London can neither be bought nor be sold. Remittances of gold are virtually out of the question, by reason of the length of the voyage to England and the great risk of capture by hostile ships. Hence, on the face of the matter, Australia, though holding the chief supply in the world of one of the chief necessities of life, is unable to meet her engagements, and according to ordinary commercial usage would be insolvent. Of course, this is in reality an absurd conclusion to draw, though it does bring out an important economic and financial truth, viz. that there are times and occasions when it is not true that all reckoning of solvency, as against insolvency, can be based upon the temporary market price of commodities or securities, instead of upon a certain intrinsic worth, which must be arrived at by taking into consideration the cost of production, in the one case, and the going value in normal times, in the other.

What is true of Australia and her wool, is true to-day of many other countries, with their principal products. Thus the wonderful growth of the prosperity of India in recent years has been mainly due to prices obtained for the jute, cotton, wheat and tea that India annually exports. There is to-day virtually no market in India for any of these commodities. All are necessities of modern life; there is not the slightest indication that the demand for any one of them will slacken in the coming years; the prices of them must inevitably return, as soon as a way has been found to buy them and pay for them, to the levels of the past decade. Yet now the owner of them in India cannot turn them into money or credit at the bank. If he is a merchant, he cannot buy them from the producers of them. And all the liquidation of credits throughout India, and as between India and England or other countries, is brought to a standstill.

This is the plight, too, of Japan with her raw and manufactured silk; of China with her teas; of Manchuria with her soya beans and with the oil and oil-cake manufactured. In their several degrees, these countries of the Far East are suffering from the same paralysis of their commerce and of their international credit liquidations, as is the United States in the matter of its cotton and the credit uses of it which are now cut off. The mention of cotton, furthermore, brings to mind Egypt, where the seeming impossibility of selling the season's production of cotton is occasioning an acute crisis through the whole country and has made necessary the interposition of the State itself with a programme for financing the present crop, on the one hand, and for compulsorily reducing the acreage in cotton next year, on the other.

Nor is the trouble confined to the raw material producing countries of Asia, Africa and North America. In South America the same conditions prevail. Brazil is driven to despair with her coffee crop and is almost on the point of undertaking a new valorization plan, despite the unhappy experience had with the old one. Argentina's corn crop is reported to be practically unsalable at any price. Chile, which depends upon ther nitrates for the rectification of her annual international balance, is unable to make any shipments at all, partly because Germany and France have been her chief buyers, but still more because there is no method available for shippers to obtain reimbursements for what they may ship. Consequently, the commercial and industrial condition of the country is well-nigh desperate. Thus it is that, from one end of the world to the other, countries which have no immediate concern whatever with the war in Europe, are called upon to pay their part of the huge cost of it,—and not in cash, but in the sufferings of their populations, whose economic production is shut off, not because the world does not require what they produce, but because the machinery for getting their products to the consuming world is out of commission.

It is obvious that so grave a disarrangement of the world's instrumentalities of production and distribution cannot long continue without dreadful disaster to the human race. Either the old machinery must be got into operation again or new machinery must be devised. It would, however, be the height of absurdity to set about the century-long task of devising new machinery. The old machinery has shown its remarkable perfection through a generation of peace, and no war, however extensive, should lead to its abandonment. The direction, then, in which fruitful effort can be directed is that of localizing the immediate source of the credit disturbance,—i. e. Germany and Austria-Hungary, with their unpaid bills in the great financial markets,—and hurrying reinforcements, in the shape of gold which is the basis of new credits, to that financial centre in which the creation and liquidation of the world's credits chiefly takes place, as things now are, i. e. to London. There and there only can the free flow of credits between the different parts of the world be re-established; and it is only through the use of these credits that the cotton in the United States, the wool of Australasia, the jute and cotton and tea of India, the coffee of Brazil, the corn of Argentina and the nitrates of Chile can find any markets at all, at least for a long period of time. Hence it has been far more than enlightened self-interest, it has been National interest as well, that has been promoted by the provision for paying abroad, —chiefly in London,—first, the $80,000,000 of obligations of New York City, and now by the bringing together of a fund of $100,000,000 in gold for judicious use in caring for a further large instalment of the indebtedness of the United States to England and the foreign countries that clear their international transactions through London.

Arthur Richmond Marsh

THE WAR REVENUE TAX BILL AS SUBMITTED TO THE HOUSE OF REPRESENTATIVES

ALTHOUGH it is in a sense a misnomer to designate as a "war revenue" measure a bill proposed in Congress for the purpose of making good a deficiency of revenue in the United States, which is not at war, yet the fact that the cause of the deficiency is the general European War has led the American public generally to speak of the new taxing bill, intended to raise some $105,000,000 of additional revenue, as the "war revenue" bill; and this is well enough justified by the circumstances. As is well known, the Ways and Means Committee of the House of Representatives has been for some time engaged in drafting this proposed act; and on Tuesday, September 22, Mr. Underwood, chairman of the committee, reported the bill to the House, where it is designated as House Bill 18891. At this writing it is expected, according to the Washington correspondent of this paper, that the bill will be put upon its passage in the House on Friday, September 25. It is to be expected that some minor changes will be made at the last moment; and, as these will be known too late for printing here, only a skeleton of the proposed act, showing the taxes to be levied, is here given. After passage by the House, the bill must of course go to the Senate, in which and possibly also in a conference committee of the House and Senate, still other changes will be made. The present summary, however, will probably be found in the main to coincide with the completed measure. It is given in the language of the bill itself.

* * *

A BILL

To increase the internal revenue, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America In Congress assembled, That there shall be levied, collected, and paid in lieu of the tax of $1 now imposed by law, a tax of $1.50 on all beer, lager beer, ale, porter, and other similar fermented liquor, brewed or manufactured and sold, or stored in warehouse, or removal for consumption or sale, within the United States, by whatever name such liquors may be called, for every barrel containing not more than thirty-one gallons; and at a like rate for any other quantity or for the fractional parts of a barrel authorized and defined by law. * * *

Sec. 2. That upon all wines which shall hereafter be manufactured and sold, or removed for consumption and sale, there shall be levied, collected, and paid by the person so manufacturing such wines the following taxes on each and every wine gallon of wine so manufactured and sold, or so removed for consumption and sale during the preceding month: On domestic sweet wines, containing more than three per centum of saccharine matter, 20 cents per gallon; and on other domestic wines, including dry wines, 12 cents per gallon. * * *

Sec. 3. That upon gasoline, motor spirits, naphtha, and other similar products, obtained from crude, partially refined, or residuum oils, and suitable for motor power, there shall be levied and collected, and paid monthly by the producer thereof, a tax of 2 cents on each and every wine gallon so produced during the preceding month. * * *

Special Taxes.

Sec. 4. That from and after November first, nineteen hundred and fourteen, special taxes shall be, and hereby are, imposed annually as follows, that is to say:

First. Bankers shall pay $2 for each $1,000 of capital used or employed, and in estimating capital surplus and undivided profits shall be included. The amount of such annual tax shall in all cases be computed on the basis of the capital, surplus, and undivided profits for the preceding fiscal year. Every person, firm, or company, and every incorporated or other bank, having a place of business where credits are opened by the deposit or collection of money or currency, subject to be paid or remitted upon draft, check, or order, or where money is advanced or loaned on stocks, bonds, bullion, bills of exchange, or promissory notes, or where stocks, bonds, bullion, bills of exchange, or promissory notes are received for discount or sale, shall be a banker under this Act: *Provided,* That any savings bank having no capital stock, and whose business is confined to receiving deposits and loaning or investing the same for the benefit of its depositors, and which does no other business of banking, shall not be subject to this tax.

Second. Brokers shall pay $50. Every person, firm, or company, whose business it is to negotiate purchases or sales of stocks, bonds, exchange, bullion, coined money, bank-notes, promissory notes, or other securities, for themselves or others, shall be regarded as a broker: *Provided,* That any person having paid the special tax as a banker shall not be required to pay the special tax as a broker.

Third. Pawnbrokers shall pay $20. * * *

Fourth. Commercial brokers shall pay $20. Every person, firm, or company whose business it is as a broker to negotiate sales or purchases of goods, wares, produce, or merchandise, or to negotiate freights and other business for the owners of vessels, or for the shippers or consignors or consignees of freight carried by vessels, shall be regarded as a commercial broker under this Act.

Fifth. Custom-house brokers shall pay $10. * * *

Sixth. Proprietors of theatres, museums, and concert halls in cities having more than fifteen thousand population as shown by the last preceding United States census, shall pay $100. * * *

Seventh. The proprietor or proprietors of circuses shall pay $100. * * * [Covers exhibitions in a single State.]

Eighth. Proprietors or agents of all other public exhibitions or shows for money not enumerated in this section shall pay $10. * * * [Covers exhibitions in a single State.]

Ninth. Proprietors of bowling alleys and billiard rooms shall pay $5 for each alley or table. * * *

Tobacco Dealers and Manufacturers.

Sec. 5. That from and after November first, nineteen hundred and fourteen, special taxes on tobacco dealers and manufacturers shall be and hereby are imposed annually as follows, the amount of such annual taxes to be computed in all cases on the basis of the annual sales for the preceding fiscal year:

Dealers in leaf tobacco whose annual sales do not exceed fifty thousand pounds shall each pay $6. Dealers in leaf tobacco whose annual sales exceed fifty thousand and do not exceed one hundred thousand pounds shall pay $12, and if their annual sales exceed one hundred thousand pounds shall pay $24: *Provided,* That dealers in leaf tobacco whose annual sales do not exceed one thousand pounds shall be exempt from the tax herein imposed on dealers in leaf tobacco.

Dealers in tobacco, not specially provided for in this section, shall each pay $4.80.

Every person whose business it is to sell, or offer for sale, manufactured tobacco, snuff, cigars, or cigarettes shall be regarded as a dealer in tobacco. * * *

Manufacturers of tobacco whose annual sales do not exceed fifty thousand pounds shall each pay $6.

Manufacturers of tobacco whose annual sales exceed fifty thousand and do not exceed one hundred thousand pounds shall each pay $12.

Manufacturers of tobacco whose annual sales exceed one hundred thousand pounds shall each pay $24.

Manufacturers of cigars whose annual sales do not exceed one hundred thousand cigars shall each pay $6.

Manufacturers of cigars whose annual sales exceed one hundred thousand and do not exceed two hundred thousand cigars shall each pay $12.

Manufacturers of cigars whose annual sales exceed two hundred thousand cigars shall each pay $24.

Manufacturers of cigarettes shall each pay $24.

[Sections 6 to 18, inclusive, of the bill, which follow upon the above recital of special taxes imposed, are devoted to the general provisions in respect of the stamp taxes imposed in Schedule A, which follows. The duty of affixing stamps is declared; the conditions under which the stamps must be affixed and canceled are defined; and the penalties and other legal consequences resulting from failure to affix the proper stamps are recited. It is unnecessary to rehearse here all the provisions about all these matters. The essential thing is to give the stamp taxes themselves as enumerated in Schedule A.]

Schedule A.—Stamp Taxes.

Bonds, debentures, or certificates of indebtedness issued after the first day of November, anno Domini nineteen hundred and fourteen, by any association, company, or corporation, on each $100 of face value or fraction thereof, 5 cents, and on each original issue, whether on organization or reorganization, of certificates of stock by any such association, company or corporation, on each $100 of face value or fraction thereof, 5 cents, and on all sales, or agreements to sell, or memoranda of sales or deliveries or transfers of shares or certificates of stock in any association, company, or corporation, whether made upon or shown by the books of the association, company, or corporation, or by any assignment in blank, or by any delivery, or by any paper or agreement or memorandum or other evidence of transfer or sale, whether entitling the holder in any manner to the benefit of such stock, or to secure the future payment of money or for the future transfer of any stock, on each $100 of face value or fraction thereof, 2 cents: *Provided*, That in case of sale where the evidence of transfer is shown only by the books of the company the stamp shall be placed upon such books; and where the change of ownership is by transfer certificate the stamp shall be placed upon the certificate; and in cases of an agreement to sell or where the transfer is by delivery of the certificate assigned in blank there shall be made and delivered by the seller to the buyer a bill or memorandum of such sale, to which the stamp shall be affixed; and every bill or memorandum of sale or agreement to sell before mentioned shall show the date thereof, the name of the seller, the amount of the sale, and the matter or thing to which it refers. * * *

Upon each sale, agreement of sale, or agreement to sell, any products or merchandise at any exchange, or board of trade, or other similar place, either for present or future delivery, for each $100 in value of said sale or agreement of sale or agreement to sell, 1 cent, and for each additional $100 or fractional part thereof in excess of $100, 1 cent: *Provided*, That on every sale or agreement of sale or agreement to sell as aforesaid there shall be made and delivered by the seller to the buyer a bill, memorandum, agreement, or other evidence of such sale, agreement of sale, or agreement to sell, to which there shall be affixed a lawful stamp or stamps in value equal to the amount of the tax on such sale. And every such bill, memorandum, or other evidence of sale or agreement to sell shall show the date thereof, the name of the seller, the amount of the sale, and the matter or thing to which it refers. * * *

Promissory notes, except bank notes issued for circulation, and for each renewal of the same, for a sum not exceeding $100, 2 cents; and for each additional $100 or fractional part thereof in excess of $100, 2 cents.

Express and freight: It shall be the duty of every railroad or steamboat company, carrier, express company, or corporation or person whose occupation is to act as such, to issue to the shipper or consignor, or his agent, or person from whom any goods are accepted for transportation, a bill of lading, manifest, or other evidence of receipt and forwarding for each shipment received for carriage and transportation, whether in bulk or in boxes, bales, packages, bundles, or not so inclosed or included; and such shipper, consignor, agent, or person shall duly attach and cancel, as is in this Act provided, to each of said bills of lading, manifests, or other memorandum, a stamp of the value of 1 cent: *Provided*, That but one bill of lading shall be required on bundles or packages of newspapers when inclosed in one general bundles at the time of shipment. * * *

Telegraph and telephone messages: It shall be the duty of every person, firm, or corporation owning or operating any telegraph or telephone line or lines to make within the first fifteen days of each month a sworn statement to the collector of internal revenue in each of their respective districts, stating the number of dispatches, messages, or conversations transmitted over their respective lines during the preceding month for which a charge of 15 cents or more was imposed, and for each of such messages or conversations the said person, firm, or corporation shall pay a tax of 1 cent: *Provided*, That only one payment of said tax shall be required, notwithstanding the lines of one or more persons, firms, or corporations shall be used for the transmission of each of said messages or conversations. * * *

Bond: For indemnifying any person or persons, firm, or corporation who shall have become bound or engaged as surety for the payment of any sum of money, or for the due execution or performance of the duties of any office or position, and to account for money received by virtue thereof, and all other bonds of any description, except such as may be required in legal proceedings, not otherwise provided for in this schedule, 50 cents.

Certificate of profits, or any certificate or memorandum showing an interest in the property or accumulations of any association, company, or corporation, and on all transfers thereof, on each $100 of face value or fraction thereof, 2 cents.

Certificate: Any certificate of damage, or otherwise, and all other certificates or documents issued by any port warden, marine surveyor, or other person acting as such, 25 cents.

Certificate of any description required by law not otherwise specified in this Act, 10 cents.

Contract: Broker's note, or memorandum of sale of any goods or merchandise, stocks, bonds, exchange, notes of hand, real estate, or property of any kind or description issued by brokers or persons acting as such, for each note or memorandum of sale, not otherwise provided for in this Act, 10 cents.

Conveyance: Deed, instrument, or writing, whereby any lands, tenements, or other realty sold shall be granted, assigned, transferred, or otherwise conveyed to, or vested in, the purchaser or purchasers, or any other person or persons, by his, her, or their direction, when the consideration or value exceeds $100 and does not exceed $500, 50 cents; and for each additional $500 or fractional part thereof in excess of $500, 50 cents.

Entry of any goods, wares, or merchandise at any customhouse, either for consumption or warehousing, not exceeding $100 in value, 25 cents; exceeding $100 and not exceeding $500 in value, 50 cents; exceeding $500 in value, $1.

Entry for the withdrawal of any goods or merchandise from customs bonded warehouse, 50 cents.

Insurance (life): Policy of insurance, or other instrument, by whatever name the same shall be called, whereby any insurance shall hereafter be made upon any life or lives, for each $100 or fractional part thereof, 8 cents on the amount insured: *Provided*,

That on all policies, for life insurance only, issued on the industrial or weekly-payment plan of insurance, the tax shall be forty per centum of the amount of the first weekly premium. And it shall be the duty of each person, firm, or corporation issuing such policies to make within the first fifteen days of every month a sworn statement to the collector of internal revenue in each of their respective districts, of the total amount of first weekly premiums received on such policies issued by the said person, firm or corporation during the preceding month, and upon the total amount so received, the said person, firm, or corporation shall pay the said tax of forty per centum: *Provided further,* That the provisions of this section shall not apply to any fraternal, beneficiary society, or order, or farmers' purely local co-operative company or association, or employes' relief associations operated on the lodge system, or local co-operation plan, organized and conducted solely by the members thereof for the exclusive benefit of its members and not for profit.

Insurance (marine, inland, fire): Each policy of insurance or other instrument, by whatever name the same shall be called, by which insurance shall be made or renewed upon property of any description (including rents or profits), whether against peril by sea or on inland waters, or by fire or lightning, or other peril, made by any person, association, or corporation, upon the amount of premium charged, one-half of 1 cent on each dollar or fractional part thereof: *Provided,* That purely co-operative or mutual fire insurance companies carried on by the members thereof solely for the protection of their own property and not for profit shall be exempted from the tax herein provided.

Insurance (casualty, fidelity, and guaranty): Each policy of insurance, or bond or obligation of the nature of indemnity for loss, damage, or liability issued, or executed, or renewed by any person, association, company, or corporation, transacting the business of accident, fidelity, employer's liability, plate glass, steam boiler, burglary, elevator, automatic sprinkler, or other branch of insurance (except life, marine, inland, and fire insurance), and each bond undertaken or recognizance, conditioned for the performance of the duties of any office or position, or for the doing or not doing of anything therein specified, or other obligation of the nature of indemnity, and each contract or obligation guaranteeing the validity or legality of bonds or other obligations issued by any State, county, municipal, or other public body or organization, or guaranteeing titles to real estate or mercantile credits executed or guaranteed by any fidelity, guarantee, or surety company upon the amount of premium charged, one-half of 1 cent on each dollar or fractional part thereof.

Mortgage or pledge, of lands, estate, or property, real or personal, heritable, or movable, whatsoever, where the same shall be made as a security for the payment of any definite and certain sum of money, lent at the time or previously due and owing or forborne to be paid, being payable; also any conveyance of any lands, estate, or property whatsoever, in trust to be sold or otherwise converted into money, which shall be intended only as security, either by express stipulation or otherwise; on any of the foregoing exceeding $1,000 and not exceeding $1,500, 25 cents; and on each $500 or fractional part thereof in excess of $1,500, 25 cents: *Provided,* That upon each and every assignment or transfer of a mortgage, or policy of insurance, or the renewal or continuance of any agreement, or contract, a stamp duty shall be required and paid at the same rate as that imposed on the original instrument.

Passage ticket, by any vessel from a port in the United States to a foreign port, if costing not exceeding $30, $1; costing more than $30 and not exceeding $60, $3; costing more than $60, $5.

Power of attorney or proxy for voting at any election for officers of any incorporated company or association, except religious, charitable, or literary societies, or public cemeteries, 10 cents.

Power of attorney to sell and convey real estate, or to rent or lease the same, to receive or collect rent, to sell or transfer any stock, bonds, scrip, or for the collection of any dividends or interest thereon, or to perform any and all other acts not hereinbefore specified, 25 cents: *Provided,* That no stamps shall be required upon any papers necessary to be used for the collection of claims from the United States for pension, back pay, bounty, or for property lost in the military or naval service.

Protest: Upon the protest of every note, bill of exchange, acceptance, check or draft, or any marine protest, whether protested by a notary public or by any other officer who may be authorized by the law of any State or States to make such protest, 25 cents.

Every seat sold in a palace or parlor car and every berth sold in a sleeping car, 2 cents, to be paid by the company selling the same.

Sec. 19. That all administrative, special, or stamp provisions of law, including the law relating to the assessment of taxes, so far as applicable, are hereby extended to and made a part of this Act. * * *

Sec. 20. That the provisions of this Act shall take effect on the day next succeeding the date of its passage, except where otherwise expressly provided: *Provided,* That on the day after the thirty-first day of December, nineteen hundred and fifteen, the taxes levied under Schedule A of this Act shall no longer be levied and collected, but all taxes arising or accruing before said date shall continue to be collectible under the terms of this Act. All stamps provided for in this Act unused after the aforesaid date shall be redeemed from the holder thereof, under such rules as the Secretary of the Treasury may prescribe.

IDEALS OF NATIONAL GREATNESS AND OF THE MEANS TO ATTAIN IT; THE EUROPEAN WAR AND GENUINE "KULTUR"

By Charles W. Eliot
President Emeritus of Harvard University

MORE than two years ago, this paper republished an address delivered by ex-President Eliot, of Harvard University, before the International Institute of Shanghai, upon "The Economic and Educational Purposes and Plans of the Carnegie Peace Endowment" [THE MARKET WORLD AND CHRONICLE, June 8, 1912, Vol. III, p. 726]. This address was delivered in the course of an extensive journey undertaken by President Eliot, for the purpose of obtaining more precise economic and social information regarding the various countries of the world, to be used by the Trustees of the Carnegie Peace Endowment in planning the work of the institution in such wise that it should be practical and possible of realization in modern society, rather than vague, theoretical and ill-adjusted to the present facts of human society everywhere.

The theme of that address was, not the instant abolition of war or of the preparations for war on the part of the nations of the earth, but the possibility of bringing into play more and more forces that tend to diminish the impulse to war and gradually to produce international conditions unfavorable to the resort of war. That there was nothing Utopian in President Eliot's conception of what may be accomplished in the way of giving peace ascendancy over war in the life of nations appeared clearly in one passage in his discourse, which ran as follows:

"It is not the expectation of the trustees [of the Carnegie Peace Endowment] that war is going to cease in the world at once, or

soon. It is not the expectation of the trustees that armaments can be abandoned—or greatly diminished soon in the world. The trustees fully recognize the fact that every government that is stable, must be founded at bottom on physical force—must control a strong protective force which will enable the government to maintain itself against domestic disorder, against threats from without,—which necessity China at this moment strikingly illustrates. The fundamental necessity of a stable government,—a government that is to be stable,—is a strong protective force. This protective force makes it possible for a government to keep the order,—to insure the continuity of its industries; to insure its own strength and power.

"The trustees, then, fully realize that the time has not yet come in the world to advocate the reduction, even, of armaments, particularly in those countries whose development has been but slow from despotic forms to freer forms. What, then, can be attained by the trustees in this all-important department of education but promotion of intercourse—friendly intercourse among the nations?"

And President Eliot went on to explain various plans to this end, which the Trustees of the Carnegie Peace Endowment already had in mind. Among these plans were the development of international law and of reliance upon its principles; universal education, in the sense of greatly increasing the common fund of knowledge, facilitating its easy transmission from country to country, and bringing its value home to the entire population, as far as may be, of every country; the promotion in every way of peaceful intercourse between the nations of the world, whether by means of commerce and finance, or by the development of international interests of a scientific, intellectual or social kind; and, finally, the encouragement everywhere of the ideal of personal initiative for the common good, rather than "too great and exclusive a reliance on government action." Thus in President Eliot's opinion, would the nations of the earth gradually come to find less and less good reason for going to war one with another, and the hasty impulses and passions and blind ambitions of this and that nation would find more and more hindrances and checks in the thought and feeling of their respective populations. Wars would diminish because the general mind would see less genuine cause and less probable advantage of a kind worth while in resorting to war.

The long study given by President Eliot to the question of war and of its place in the life of mankind, present and future, makes more than temporarily important his judgment upon the dreadful war that is now running its baleful course in Europe. He has not been and is not a man of war himself, though perhaps nobody in the United States has more nobly expressed the glory of the self-devotion of those who conceive themselves to be fighting for a just cause. What he himself is, however, is one of the greatest living judges of that "Kultur,"—that civilization,—which it has been asserted; at least on one side, is at stake in the present war in Europe. Fortunately, he has expressed this judgment in a letter addressed to the New York "Times," and published by that paper on Tuesday, September 22. It is well that this judgment should be recorded in as many places and should reach the eyes of as many people as possible. Accordingly, it is here reprinted from the New York "Times."

* * *

To the Editor of the New York "Times":

There is nothing new in the obsession of the principal European nations that, in order to be great and successful in the world as it is, they must possess military power available for instant aggression on weak nations, as well as for effective defense against strong ones.

When Sir Francis Bacon wrote his essay on "The True Greatness of Kingdoms and Estates," he remarked that forts, arsenals, goodly races of horses, armaments, and the like would all be useless "except the breed and disposition of the people be stout and warlike." He denied that money is the sinews of war, giving preference to the sinews of men's arms, and quoted Solon's remark to Croesus "Sir, if any other come that hath better iron than you, he will be master of all this gold"—a truly Bismarckian proposition. Indeed, Sir Francis Bacon says explicitly "that the principal point of greatness in any State is to have a race of military men."

Goethe, reflecting on the wretchedness of the German people as a whole, found no comfort in the German genius for science, literature, and art, or only a miserable comfort which "does not make up for the proud consciousness of belonging to a nation strong, respected, and feared." Because Germany in his time was weak in the military sense, he could write: "I have often felt a bitter grief at the thought of the German people, which is so noble individually, and so wretched as a whole"; and he longed for the day when the national spirit, kept alive and hopeful, should be "ready to rise in all its might, when the day of glory dawns."

"The day of glory" was to be the day of military power. Carlyle said of Germany and France in November, 1870, "that noble, patient, deep, pious, and solid Germany should be at length welded into a nation, and become Queen of the Continent, instead of vaporing, vain-glorious, gesticulating, quarrelsome, restless, and oversensitive France, seems to me that hopefulest public fact that has occurred in my time." How did Germany attain to this position of "Queen of the Continent"? By creating and maintaining with utmost intelligence and skill, the strongest army in Europe—an army, which, within six years, had been used successfully against Denmark, Austria, and France. Germany became "Queen" by virtue of her military power.

In the same paper, Carlyle said of the French Revolution, of which he was himself the great portrayer, "I often call that a celestial infernal phenomenon, the most memorable in our world for a thousand years; on the whole, a transcendent revolt against the devil and his works (since shams are all and sundry of the devil, and poisonous and unendurable to man)." Now the French Revolution was an extraordinary outbreak of passionate feeling and physical violence on the part of the French nation, both at home and abroad; and it led on to the Napoleonic wars, which were tremendous physical struggles for mastery in Europe.

In a recent public statement two leading philosophical writers of modern Germany, Professors Eucken and Haeckel, denounce the "brutal national egoism" of England, which they say "recognizes no rights on the part of others and, unconcerned about morality or unmorality, pursues only its own advantage"; and they attribute to England the purpose to hinder at any cost the further growth of German greatness. But what are the elements of that German greatness which England is determined to arrest by joining France and Russia in war against Germany and Austria-Hungary? The three elements of recent German greatness are the extension of her territory; contiguous territories in Europe and in other continents colonial possessions; the enlargement of German commerce and wealth, and to these ends the firm establishment of her military supremacy in Europe. These are the ideas on the true greatness of nations which have prevailed in the ruling oligarchy of Germany for at leas sixty years, and now seem to have been accepted, or acquiesced in, by the whole German people. In this view, the foundation of national greatness is fighting power.

This conception of national greatness has prevailed at many different epochs—Macedonian, Roman, Saracen, Spanish, English, and French—and, indeed, has appeared from time to time in almost

all the nations and tribes of the earth; but the civilized world is now looking for better foundations of national greatness than force and fighting.

The partial successes of democracy in Europe have much increased the evils of war. Sir Francis Bacon looked for a fighting class; under the feudal system when a Baron went to war he took with him his vassals, or that portion of them that could be spared from the fields at home. Universal conscription is a modern invention, the horrors of which, as now exhibited in Germany, Austria-Hungary, and France, much exceed those of earlier martial methods. There has never been such an interruption of agricultural and industrial production, or such a rending of family ties in consequence of war as is now taking place in the greater part of Europe. Moreover, mankind has never before had the use of such destructive implements as the machine gun, the torpedo, and the dynamite bomb. The progress of science has much increased the potential destructiveness of warfare.

Thinking people in all the civilized countries are asking themselves what the fundamental trouble with civilization is, and where to look for means of escape from the present intolerable conditions. Christianity in nineteen centuries has afforded no relief. The so-called mitigations of war are comparatively trivial. The recent Balkan wars were as ferocious as those of Alexander. The German aviators drop aimless bombs at night into cities occupied chiefly by non-combatants. The North Sea is strewn with floating mines, which may destroy fishing, freight, or passenger vessels of any nation, neutral or belligerent, which have business on that sea. The ruthless destruction of the Louvain Library by German soldiers reminds people who have read history that the destroyers of the Alexandria Library have ever since been called fanatics and barbarians. The German Army tries to compel unfortified Belgian cities and towns to pay huge ransoms to save themselves from destruction—a method which the Barbary States, indeed, were accustomed to use against their Christian neighbors, but which has long been held to be a method appropriate only for brigands and pirates—Greek, Sicilian, Syrian, or Chinese.

How can it be that the government of a civilized State commits, or permits in its agents, such barbarities? The fundamental reason seems to be that most of the European nations still believe that national greatness depends on the possession and brutal use of force, and is to be maintained and magnified only by military and naval power.

In North American there are two large communities—heretofore inspired chiefly by ideals of English origin—which have never maintained conscripted armies, and have never fortified against each other their long frontier—Canada and the United States. Both may fairly be called great peoples even now; and both give ample promise for the future. Neither of these peoples lacks the "stout and warlike" quality of which Sir Francis Bacon spoke; both have often exhibited it. The United States suffered for four years from a civil war, characterized by determined fighting in indecisive battles, in which the losses, in proportion to the number of men engaged, were often much heavier than any thus far reported from the present battlefields in Belgium and France. There being then no lack of martial spirit in these two peoples, it is an instructive phenomenon that power to conquer is not their ideal of national greatness. Much the same thing may be said of some other self-governing constituents of the British Empire, such as Australia, New Zealand, and South Africa. They, too, have a better ideal of national greatness than that of military supremacy.

What are the real ambitions and hopes of the people of the United States and the people of Canada in regard to their own future? Their expectations of greatness certainly are not based on any conception of invincible miltiary force, or desire for the physical means of enforcing their own will on their neighbors. They both believe in the free commonwealth, administered justly, and with the purpose of securing for each individual all the freedom he can exercise without injury to his neighbors and the collective well-being. They desire for themselves, each for itself, a strong government, equipped to perform its functions with dignity, certainty, and efficiency; but they wish to have that government under the control of the deliberate public opinion of free citizens, and not under the control of any Praetorian Guard, Oligarchic Council, or General Staff, and they insist that the civil authority should always control such military and police forces as it may be necessary to maintain for protective purposes.

They believe that the chief object of government should be the promotion of the public welfare by legislative and administrative means; that the processes of government should be open and visible, and their results be incessantly published for approval or disapproval. They believe that a nation becomes great through industrial productiveness and the resulting internal and external commerce, through the gradual increase of comfort and general well-being in the population, and through the advancement of science, letters, and art. They believe that education, free intercourse with other nations, and religious enthusiasm and toleration are means of national greatness, and that in the development and use of these means force has no place. They attribute national greatness in others, as well as in themselves, not to the possession of military force, but to the advance of the people in freedom, industry, righteousness, and good-will.

They believe that the ideals of fighting power and domination should be replaced by the ideals of peaceful competition in production and trade, of generous rivalry in education, scientific discovery, and the fine arts, of co-operation for mutual benefit among nations different in size, natural abilities, and material resources, and of federation among nations associated geographically or historically, or united in the pursuit of some common ends and in the cherishing of like hopes and aspirations. They think that the peace of the world can be best promoted by solemn public compacts between peoples—not princes or cabinets—compacts made to be kept, strengthened by mutual services and good offices, and watched over by a permanent International Judicial Tribunal authorized to call on the affiliated nations for whatever force may be necessary to induce obedience to its decrees.

Will not the civilized world learn from this horrible European war—the legitimate result of the policies of Bismarck and his associates and disciples—that these democratic ideals constitute the rational substitute for the imperialistic ideal of fighting force as the foundation of national greatness? The new ideals will still need the protection and support, both within and without each nation, of a restrained public force, acting under law, national and international, just as a sane mind needs as its agent a sound and strong body. Health and vigor will continue to be the safeguards of morality, justice and mercy. Yours truly,

CHARLES W. ELIOT.

Asticon, Me., September 14, 1914.

INDUSTRY, COMMERCE AND FINANCE

The Foreign Trade of the United States in August.—The Bureau of Statistics at Washington has published its returns for last month's foreign commerce of the United States. It shows that August exports of merchandise amounted to only $110,337,000, as against $154,082,000 in July and $187,909,000 in August last year.

No single month since the middle of 1909 showed so small a total of merchandise exports for the country.

Imports of merchandise suffered to a much smaller extent from the trade blockade than did exports. They were $129,400,000, against $160,178,000 in July and $137,651,000 in August, 1913, and were the smallest of any month since the close of 1911.

Of the August imports, 61.8 per cent entered free of duty, compared with 50.9 per cent in August, 1913, and 54.3 per cent in August, 1912. Of the month's exports, $108,188,732 consisted of domestic merchandise.

Following are the changes shown from 1913:

	August.	Eight Months.
Exports	—$77,571,475	—$203,862,450
Imports	— 8,251,057	113,602,641

Following is a comparison of the month's total exports and imports with July and with August last year:

	August, 1914.	July, 1914.	August, 1913.
Exports	$110,337,545	$154,082,225	$187,909,020
Imports	129,399,496	160,178,133	137,651,553
Excess exported	.....	.....	$50,257,467
Excess imported	$19,051,951	$6,095,908	.....

Classifying the month's exports according as they represent agricultural or other than agricultural products, the comparison is as follows:

Exports.	August, 1914.	July, 1914.	August, 1913.
Agricultural	$47,672,728	$61,055,953	$69,966,214
Non-agricultural	62,664,817	93,026,272	117,942,806

For a series of months the trade totals were as follows:

	Exports.	Imports.	Excess.
August	$110,337,545	$129,399,496	Imp. $19,051,951
July	154,032,225	160,178,133	Imp. 6,095,908
June	157,119,451	157,772,973	Imp. 653,522
May	161,732,619	164,281,515	Imp. 2,548,896
April	162,552,570	173,762,114	Imp. 11,209,544
March	187,493,234	182,555,304	Exp. 4,943,930

For the eight months ending August 31, the country's exports and imports compared as follows:

	1914.	1913.	1912.
Exports	$1,311,319,707	$1,515,182,157	$1,416,346,429
Imports	1,269,992,869	1,156,300,229	1,183,075,234
Excess exports	$41,326,838	$358,881,929	$228,271,195

Government returns on the country's exports and imports of gold in August make the following comparison:

	August, 1914.	July, 1914.	August, 1913.
Exports	$18,125,617	$23,660,424	$1,194,657
Imports	3,034,824	3,391,715	5,803,753
Excess imports	.....	.....	$4,609,096
Excess exports	$15,090,793	$20,277,709	.....

Exports and imports of silver coin and bullion for the month were:

	August, 1914.	July, 1914.	August, 1913.
Exports	$3,627,337	$3,952,956	$4,907,806
Imports	2,162,095	1,238,104	3,401,335
Excess exports	$1,465,242	$2,714,852	$1,505,471

* * *

Foreign Trade of Great Britain in August.—The figures of the Board of Trade covering British trade for August show a heavy falling off in both imports and exports. Imports reached a value for the month of £42,362,034, as against £56,011,530 for August, 1913, a decrease of 24.5 per cent. Exports reached a value of £28,631,104, as against £52,261,228 last August, a decrease of 45.2 per cent. The following table, compiled from figures in "The Economist" of London, shows the imports and exports for August, 1914, and for the first eight months of 1914, compared with the figures for the same periods in 1913:

August, 1913-1914.

	Imports (Value)		Exports (Value)	
Article.	1914, £.	1913, £.	1914, £.	1913, £.
Food, drink and tobacco	21,4 7,2.4	23,564,901	1,531,900	2,834,521
Raw materials:				
Articles mainly unmanufact'd	13,932,899	16,759,827	2,873,697	5,367,405
Articles wholly or mainly manufactured	6,752,536	15,462,325	19,378,290	35,129,177
Miscellaneous	170,404	224,387	427,334	773,626
	42,362,034	56,011,530	28,631,104	52,261,228

First Eight Months, 1913-1914.

	Imports (Value)		Exports (Value)	
Article.	1914, £.	1913, £.	1914, £.	1913, £.
Food, drink and tobacco	181,431,232	185,912,063	18,658,744	19,090,431
Raw materials:				
Articles mainly unmanuf't'd	171,962,032	179,127,803	43,197,680	45,703,019
Articles wholly or mainly manufactured	122,036,641	129,433,469	255,712,532	276,997,363
Miscellaneous	2,090,723	2,018,629	6,505,306	6,539,932
	477,570,628	496,491,964	325,596,427	423,848,164

It will be seen from this that imports of foodstuffs and new materials have not shown a very heavy falling off, but in imports of manufactures the decline has been over 50 per cent, owing to the fact that the majority of British imports of manufactures originate on the Continent. In foodstuffs, grain and flour imports increased by £778,064, owing to the large available supply from the United States and Canada. The largest falling off is in sugar, which dropped from £2,145,353 in August, 1913, to £626,155 last month. Under raw material the heaviest decline occurs in wool, from £4,337,523 to £2,134,622, owing to the stoppage of Russia's Baltic trade.

As to the exports the bulk of the falling off comes under articles wholly or mainly manufactured, which declined from £35,129,177 in August, 1913, to £19,378,290, last month. These figures are set forth in the following table:

	August		Increase or
	1913.	1914.	Decrease.
Iron and steel and manufactures thereof	£4,117,966	£2,295,351	—£1,822,615
Other metals and manufactures thereof	986,921	549,899	— 437,022
Machinery	2,885,774	1,708,073	— 1,177,701
New ships	2,823,855	250,307	— 2,573,548
Yarn and textile fabrics:			
Cotton	10,469,920	5,839,981	— 4,629,939
Wool	3,570,889	2,136,029	— 1,434,860
Apparel	1,526,387	1,084,966	— 441,421
Chemicals, drugs, dyes and colors	1,548,181	935,893	— 612,288
Miscellaneous	2,821,456	1,776,735	— 1,044,721

"The huge fall in cotton exports," says "The Economist," "shows at once why Lancashire is the darkest spot in the country as regards unemployment and distress."

As to the future, "The Economist" concludes:

"* * * * One discomforting fact is that the August returns include exports sent to Germany during the days preceding the declaration of war. At a rough estimate, we sent direct to Germany goods to about 25 per cent of the value of the exports recorded in August, 1913. Next month this remaining 25 per cent must go. * * * On the other, there was a considerable period last month when practically nothing left our shores. This is not likely to recur, and as the improvement in the financial situation makes arrangements for foreign payment easier, our extra-European commerce may be expected to recover a great deal of the ground lost in August. A full recovery to the normal level in trade with non-belligerent countries can hardly be expected, for a war like the present one lessens the purchasing power of the world, and brings distress to every nation. But, on the other hand, orders going in normal times to Germany and France will in some degree be diverted here. * * * On the whole, the decline in the volume of trade, appalling as it is, is not more than was expected, and some material improvement on the August figures is anticipated next month."

INSURANCE

Articles on the Theory, Practice and Experience of Insurance.

Notes on Insurance, American and Foreign.

Items of Insurance News.

THE provisions of the Underwood War Revenue Tax Bill in respect of insurance, as these appear on other pages of this paper, can hardly be of much comfort to those persons in the insurance business who have been advocating the making of insurance a National, instead of a State affair. One of the chief arguments of these persons has been that the taxation of insurance by the States is indefensibly burdensome upon thrift, and that this taxation would be avoided if the Federal Government should be given entire control of the whole matter, whether under the guise of a declaration by Congress that insurance is commerce, despite the United States Supreme Court to the contrary, or through a Constitutional amendment placing insurance, as such, under Federal authority. The treatment of insurance in the income tax section of the Underwood Tariff Act was perhaps the first clear indication that, in so far as taxation is concerned, the removal of insurance from State to Federal control might prove to be simply jumping out of the frying-pan into the fire. And now this new special revenue bill amply confirms the indications of the regular tariff and income tax law. Insurance in its various forms has evidently been particularly selected as affording one of the easiest sources of revenue, and the field of insurance has been minutely covered, so that virtually every form of insurance should be compelled to carry its portion of the load. All arguments, thoroughly sound in our opinion, against the propriety of levying taxes on thrift and self-sacrifice (in the case of life insurance) or upon economic losses, instead of upon gains or profits, (in the case of fire and the other forms of indemnity insurance), have been completely neglected by the framers of the present bill; and the accesibility of the money to be taxed and the certainty of the collection of the tax upon it, by the insurance companies and then by the Government from them, have over-ridden all other considerations, whether economic or social, that have been brought to the attention of the National law-makers. Consequently, if the measure passes in substantially its present form, as there is every indication that it will, insurance will within a single year have had imposed upon it by the National Government two kinds of tax, the income (or corporation) tax proper, and this war revenue stamp tax. It goes without saying that the aggregate of the two taxes will be a very large sum of money, much in excess, on a rough calculation, of the State taxes which have been so great a cause of discontent to the officers and directors of our insurance companies.

Leaving, however, this larger question aside, it is of interest to bring out some of the particularities of this war revenue tax measure as regards insurance which do not, at a first reading strike the eye. The first of these is that the paragraphs ostensibly covering insurance by no means include all the taxes which insurance will be called upon to pay. Thus the provision, inserted many paragraphs before the insurance paragraphs proper, requiring a stamp of 2 cents for each $100 or part thereof to be affixed to "every certificate of profits, or any certificate or memorandum showing an interest in the property or accumulations of any association, company or corporation," will apply to all memoranda of dividends, or return premiums, of life insurance companies and of mutual companies in all the branches of insurance. So, too, the requirement of a tax of 10 cents in stamps on "certificates of any description required by law not otherwise specified in this Act," will undoubtedly hit insurance in a great many unsuspected ways, as, for example, in the great field of workmen's compensation insurance, in which a large variety of certificates, medical and other, is called for by the laws of the various States which have enacted workmen's compensation laws. No inconsiderable sum in the aggregate will certainly be involved in this single provision. On the other hand, it may be remarked in passing, that while virtually all other classes of brokers have been made subject to a special tax, insurance brokers have for some reason been omitted from the list of taxables. But, as against this, it must be borne in mind that insurance companies will be called upon to pay a very large sum in the aggregate for stamp taxes on the transfers of their securities and on various instruments they must execute in connection with their investments in real property or mortgage deeds of trust, and the like.

Coming now to the paragraphs of the bill that deal directly with insurance, we find first the provisions regarding life insurance. Here it would seem that all policies of life insurance, with the totally indefensible exception of those issued by fraternal and beneficiary societies and the like, call for 8 cents per $100 or part thereof in stamps; and this would seem to apply to reinstatements, as well as to the original policies. As the average amount of the ordinary life policies issued in the United States is not far from $2,000, this means about $1.60 per policy; and this tax alone should yield into the millions of dollars. It would be hard to estimate the aggregate yield of the tax of 40 per cent of the first weekly premium in the case of industrial policies. It is interesting to observe that, under this paragraph, apparently no tax is payable in respect of contracts of annuities proper, but that contracts of survivorship annuities are taxable.

The chief comment required upon the paragraph dealing with marine, inland and fire insurance companies, is that taxes collected upon marine policies covering goods for export will almost certainly be declared unconstitutional by the Supreme Court, as soon as the Thames and Mersey case reaches that tribunal,—just as the tax on foreign bills of lading, imposed by the Spanish War revenue Act, was held to be a tax on exports and hence unconstitutional. The exemption clause of this paragraph is peculiar in that it exempts from taxation only the policies of co-operative or mutual fire insurance companies. Policies of mutual tornado insurance associations, hail insurance associations, horse and cattle insurance associations, flood damage insurance associations,—examples of all which exist in the United States,—are not exempted; nor are policies of mutual marine insurance associations.

When we read the matter of casualty, fidelity and guaranty insurance, we are struck at once with the total failure to deal clearly with the question of the taxation of workmen's compensation insurance policies. In so far as workmen's compensation insurance is a form of employers' liability insurance, written by persons, associations, companies or corporations, it is covered, and the tax of 1 per cent of the dollar of premium is imposed. Thus, in New York insurance companies, employers' mutual associations and probably self-insuring employers appear certainly to be taxable in respect of their policies. But how about the State Fund provided by law? In Massachusetts, the policies of the Massachusetts Employers' Insurance Association are certainly taxable; but how about the policies of the Workmen's Compensation Commissions of Ohio, Washington, California, etc. Are their policies of insurance of employers against workmen's compensation losses also taxable? This is an interesting but unanswerable question at the moment.

SHOULD WE ABANDON THE AMERICAN RESTRICTIONS UPON THE CLASSES OF INSURANCE WRITTEN BOTH (a) BY A COMPANY DOING DIRECT WRITING, AND (b) BY A COMPANY DOING REINSURANCE

By Frank Hasbrouck*
Superintendent of Insurance of New York

THERE is assigned to me the following question:

'Should we abandon the American restrictions upon the classes of insurance written both (a) by a company doing direct writing, and (b) by a company doing reinsurance?"

The questions involved in this discussion lead directly into the broadest field of departmental supervision and general public policy. For more than half a century the American system of insurance underwriting has recognized the fact that the word "insurance" is a generic term and that the various species of business belonging in the realm of insurance are not very closely related to each other either in form or principle. Generally speaking, under our present-day American system, the laws of most of our States have restricted the underwriting powers of insurance corporations to specific and definite kinds or classes of hazard. For example, the New York insurance law, which may perhaps be taken as typical, recognizes the following fields for the operation of stock companies:

I. Fire and marine, including the incidental risks of sprinkler leakage, lightning, hail, tornado and automobile, except injuries to the person;

II. Life, including health and accident, and employers' liability;

III. Casualty, including fidelity, surety, burglary, plate glass, live stock, steam boiler, elevator, and automobile, except the fire hazard;

IV. Title, including the guaranty of mortgages;

V. Securities guaranty;

VI. Credit guaranty.

Although this classification may not be wholly logical, nor each class mutually exclusive, it is that which is referred to in the question under discussion as the "American" system. It seems unnecessary to detail the process by which this classification was evolved. Suffice it to say that it is a very practical recognition of the fact referred to above, that marked differences exist in the character and hazard of the various kinds of insurance business.

At the last session of the New York Legislature a bill was presented for the amendment of the Insurance Law of that State which, although it there received little serious consideration—having never been reported favorably to either house by the respective insurance committees—undoubtedly gave occasion for the present discussion. This bill provided for the organization and admission to transact business in New York of corporations empowered to make reinsurances in every field of insurance. On this account the bill was regarded as out of harmony not only with the Insurance Law of New York, but with the American system of insurance, and it was felt that its passage might perhaps be the forerunner of the adoption in this country of a new system or theory for the regulation of insurance companies, which has been somewhat vaguely referred to as the system obtaining in Europe.

The business of fire and marine and of life insurance was familiar and fairly well established in the United States before there was any thought of special laws to regulate corporations engaged therein; in fact, before there were even general laws for the organization of corporations. Special charters were at first granted by the legislatures upon application by the interested parties, and, presumably, such powers accorded as were asked, if not thought to be inexpedient. In these charters life powers were sometimes coupled with fire and marine, or general insurance powers were conferred without any limitation; but in almost every instance the business of these early companies quickly became specialized, and limited to marine, marine and fire, or fire insurance exclusively. As the demand for life insurance grew, however, companies were organized under special charters embracing life powers only; and thus when the practice of authorizing incorporation under general laws came into vogue, and the necessity for the supervision of insurance corporations became recognized, the first logical subdivision into classes of the business of insurance as then carried on had already occurred, and naturally became embodied in the law.

Gradually, as the legislatures recognized the necessity for evidences of good faith on the part of the promoters of new insurance companies, and of continued protection for the policyholders after the companies became established—especially in the instance of life insurance companies, which are primarily fiduciary corporations—requirements were imposed for the limitation of expenses, the making of deposits, the creation of reserves, and the accumulation of surplus. These requirements and their relations to outstanding liabilities, which of necessity vary in the several lines of insurance concerned, and the restricting of the character of the securities in which the companies may invest their assets—in fact, all the legal requirements which we very reasonably regard as fundamental to the proper conduct of the insurance business—have necessarily become an essential part of the so-called American system of classification, and, conversely, the American system of classification has become an integral part of the law and practice of departmental supervision of the insurance business.

It has apparently been assumed that the law and practice of the European nations with respect to the regulation of the insurance business differ from ours above described, in that unlimited underwriting powers are conferred upon and exercised by insurance corporations. This impression might readily be gained from a perusal of the multifield charters of the several great English insurance companies which have sought and obtained authority to write limited lines of insurance in many of our States. Reference to the "Assurance Companies Act" of 1909 (9 Edward 7, 49), however, discloses the following provisions:

> "3. (1) In the case of an assurance company transacting other business besides that of assurance or transacting more than one class of assurance business, a separate account shall be kept of all receipts in respect of the assurance business or of each class of assurance business and the receipts in respect of the assurance business, or, in the case of a company carrying on more than one class of assurance business, of each class of business, shall be carried to and form a separate assurance fund with an appropriate name: Provided that nothing in this section shall require the investments of any such fund to be kept separate from the investments of any other fund."
>
> "(2) A fund of any particular class shall be as absolutely

An address before the National Convention of Insurance Commissioners, September 16, 1914.

the security of the policyholders of that class as though it belonged to a company carrying on no other business than assurance business of that class and shall not be liable for any contracts of the company for which it would not have been liable had the business of the company been only that of assurance of that class, and shall not be applied, directly or indirectly, for any purposes other than those of the class of business to which the fund is applicable."

"This Act," in the words of Mr. J. H. Watts, the author of an annotated edition, "governs the operations of all companies or persons transacting insurance business in any of the following five departments—life, fire, accident, employers' liability and bond investment business—and extends the law as laid down in the Life Assurance Companies Acts, 1870-1872, and the Employers' Liability Insurance Companies Act, 1907 (as amended by this Act), to companies which carry on the other three classes of insurance: Fire, accident (or sickness), and bond investment business. All other classes of insurance such as marine, burglary, plate glass, motor car, etc., are not affected, and reinsurance companies do not come within the scope of the act."

Although there are many large British corporations which, subject to the foregoing statutory limitations, cover every line of insurance, the Insurance Law of the Dominion of Canada, one of the most prosperous and conservative colonies of Great Britain, distinctly limits the classes of insurance which any one corporation shall be licensed to transact in Canada. Reference to section 8, part I of the Canadian Insurance Act of 1910, shows that the limitations thereby prescribed for a single corporation are more stringent than, for example, those of the New York law which I have outlined.

On the Continent the law and the practice are fairly uniform and consistent. In France and Germany life insurance corporations are restricted absolutely to the making of contracts which depend upon the duration of human life. In Germany all other lines of insurance may, with the permission and approval of the supervising authority, be carried on by one corporation. Separate accounts for each line are, however, required to be kept. Nevertheless, the corporate assets accumulated in one department of the business are subject to the corporate obligations incurred in other departments. In France, on the contrary, separate corporate entities, with separate assets and capital stock, seem to be created by the same corporators, for the purpose of acquiring and exercising multifield powers.

The other Continental nations, so far as I have been able to discover, have adapted their law and practice to that of their neighbors, France and Germany, by whom the principles of governmental supervision of the insurance business are more highly developed and more rigorously enforced.

From this review of existing conditions it is apparent that some form of segregation of assets is and has been universally recognized to be an essential to the protection of the contributions made by one class of policyholders from the hazards involved and the losses sustained in other lines of insurance. The usual and natural, and manifestly the most effective, way to accomplish this segregation is by means of limitations upon and restrictions of corporate powers which I have endeavored to show is the tendency both at home and abroad.

Let us consider for a moment the conditions surrounding the various branches of insurance as they are transacted in this country under our American system to-day.

I believe that all will concede that a life insurance company is a fiduciary corporation, whether it be a stock or a mutual company, in that it is the custodian of trust funds placed in its possession to meet future obligations to its policyholders. Its reserve accumulations are held for the protection of its policyholders and are so accumulated and safeguarded as to furnish a fund which will enable it to meet at maturity obligations which, by their very nature, are deferred as a rule for many years but which are certain to occur. Savings banks, which in a certain sense are akin to life insurance companies, are hedged in by legal restrictions as to the investment of their funds and their business procedure so as to insure as far as possible the security of the deposits made with them. As the security of life insurance is equally necessary for the general good of the dependents of the insured, it seems most advisable that the restrictions of life insurance companies should be at least as rigid as those of savings banks, and that the security should not be made doubtful by allowing life insurance companies to engage in any lines of business not appertaining to the person. Then, too, by the terms of the New York law the investments for life insurance companies are restricted to a degree not applicable to other classes of insurance corporations. Speaking for the New York department, I certainly am not prepared to advocate a broadening of the scope of investments for life insurance companies, nor am I prepared to say that the other classes of insurance corporations should be limited in their investments as life companies are.

I also believe that all will agree that the fire insurance corporation, stock or mutual, is more nearly a business organization created for the purpose of protecting for a short period, usually of one or three years, the property owner from loss which may come to him from fire during that period. The fire company by the very nature of its business cannot to the same degree be regarded as a fiduciary corporation. If it is a stock company, those interested in it hazard the investment which they may place in the capital stock as against those profits which may follow favorable underwriting and satisfactory investment. If it is a mutual company, while the capital stock safeguard is not in existence, the policyholder owing to the assessment provision takes the place of the stockholder. What has been said of the fire company is largely applicable to the casualty corporation; it cannot be considered a fiduciary corporation to the same extent as a life insurance company.

Viewing a general casualty insurance corporation and analyzing its various branches of business, one is almost forced to the conviction that some of the lines of business are by their very nature such that safer and better underwriting would be accomplished if the number of different classes of business any one corporation may do were reduced.

Employers' liability insurance, by its very nature, carries with it a long-deferred liability that makes it most difficult, at any given time, to arrive at the true financial condition of a company writing this business. Concededly the special loss reserve which is charged against the employers' liability corporation as such is inadequate.

Next we come to the fidelity and surety contract. The bonds guaranteeing the performance of contracts which are written by such corporations, have assumed in recent years a volume and an undeterminable liability which is one of the serious problems confronting departmental supervision from the viewpoint of solvency. The typical obligations of surety companies, viz., guaranties, undertakings on appeal, and fidelity bonds, involve the vicissitudes of speculative business and the vagaries of chance. The moral hazard preponderates, and there is substantially no law of average. Each risk is so different from every other risk, and each comprises so many varied elements that no [illegible] underwriting principles have yet been deduced from classified ex-

perience. Every risk, therefore, constitutes a law unto itself; and sound business judgment and knowledge of men are practically the only guides to successful underwriting.

Despite this apparent diversity of risks, competition for business has created a superficial uniformity in premium rates. The Empire State Surety Company, which is in liquidation under the liquidation bureau of the New York department, has, for example, been sued by the City of New York and compelled to defend, at its own expense and without any hope of indemnity from its principal in event of loss, an action for $144,000 damages under a bond, written at the request of an irresponsible contractor, for which it received a premium of $2.50.

When claims are asserted, complicated questions of law and fact are frequently raised upon which the existence or non-existence of liability depends; and the actual liabilities of the company upon its accumulation of disputed claims become increasingly difficult to compute or even approximate.

It is hoped, and in fact expected, that few, if any, insurance corporations will have to go into liquidation for at least many years to come. In the event, however, of such liquidations, it seems desirable to keep in mind the fact that the liquidation of one of our own corporations would be seriously complicated if it were a company with multifield powers. Under the system at present in vogue in this country, with a receivership—either a court receivership or a departmental liquidation—it is possible to arrive at a definite liability and a ready distribution of assets in certain classes of companies, as for instance life or fire, which would be absolutely lost if there were injected into either of the above branches the writings of general casualty insurance other than to the person, particularly fidelity and surety.

Legislation of recent years has been in the direction of a greater safeguarding of the interests of the assured, notably in the field of life insurance. In New York State a statutory limitation is placed upon the cost of procurement of life business. In connection with limitation of expense, it seems desirable to refer to the fact that the New York law specifically requires the Superintendent to give approval to the adequacy of rates charged by stock and mutual companies writing compensation insurance. In giving consideration to the rates approved for the compulsory insurance, a charge upon the employers of the State, the department believed it to be its duty to specifically limit the percentage of premiums received which could be used for expenses. This was a department ruling which, in my judgment, should become a part of the statutes of every State.

It is now exceedingly difficult to make a proper division of expenses of the few companies which already transact the business of life, personal accident and employers' liability insurance, including workmen's compensation, all of which are insurances to the person. If the powers of these companies are extended to write fire, marine, and general casualty business, the division of expense would become practically impossible.

After this review it seems to me that we shall be forced to answer the first part of the question under discussion, namely—

> "Should we abandon the American restrictions upon the classes of insurance written by a company doing direct writing"—

in the negative.

Reinsurance Companies.

Now with regard to the question involved in the latter part of our subject as to companies doing reinsurance: It is my understanding that, to a degree at least, the subject now before us is incident to the suggestion that corporations limiting their business to reinsurance should be privileged in their writing capacity beyond corporations doing a direct writing business. Viewing this question from the various angles which have been brought to my attention, it does seem that if it is advisable for the reinsurance company to be so privileged, it is equally advisable to extend the privilege to the direct company. Every direct company by the very nature of the business is more or less a reinsurer. The direct company placing reinsurances with an authorized direct or reinsurance company is allowed credit therefor. Such being the fact, it would seem that the same measurements of responsibility should be applied to the reinsuring company which are applied to the direct writing company. In other words, the statutory limitations of the direct writer should be equally applicable to the reinsurer.

I have not lost sight of the fact that it is claimed that the restrictions of direct writing companies should be more severe than those of purely reinsurance companies, because the public insuring in the direct writing companies has not the necessary technical knowledge to be satisfied with its own estimates of the strength of the direct writing company, but a direct writing company from its own experience in the business should be able to use its own judgment as to the strength of a purely reinsurance company.

Believing that the recognition of the right of the reinsurance company to enter into all of the fields of insurance will be but an opening wedge for the direct company to enter into all fields, and submitting that the statements contained in this paper are such as to show the danger of giving increased powers to the direct writer, I find myself in the position of not being able to give approval to the second proposition, viz., the recognition of multifield lines for the reinsurer.

Conclusion.

Let me add that it has been my endeavor to present an outline of the development of the natural forces of conservation which have helped to build up our present-day American systems of insurance as well as those in vogue across the sea.

It appears to me that the present-day classification of the business of insurance known as the American system, has been reached through a gradual process of elimination, starting with special charters containing any and all the powers the incorporators might choose to request, and gradually becoming more and more restricted as company experience and State supervision found the situation from time to time demanded. The trend abroad is apparently in much the same direction. By the legislation of recent years England is regulating her multifield corporations by the sequestration of funds. France and Germany are restricting their life companies absolutely to the making of contracts which depend upon the duration of human life, and in Germany the securing of a general charter for all lines other than life is regulated in a marked degree. In Canada, the classification is even more rigid than in the United States. Foreign corporations having excess powers have found it possible, I might almost say convenient, to conform to our system through the establishment of branches with special funds in the hands of trustees for the benefit of United States policyholders; and, in cases where wider underwriting powers are desired, by the organization of separate domestic corporations with independent capital and surplus.

It would appear, therefore, that the American system of classification is being generally recognized as the desirable one. Such being the fact, why should we at this time depart from our classification of business, which has resulted satisfactorily, and adopt another which is gradually being abandoned by others? Any such change in our method would involve the necessity of a readjustment of all relations between supervising departments and companies on the one hand, and between companies and their

policyholders on the other, which would unsettle the business of insurance for many years to come. Moreover, if such a change were made, I submit that, unless the insurance business were subjected to a rigor and minutiae of supervision and regulation with which our companies are as yet unfamiliar, the funds contributed by policyholders would be deprived of that protection which they now enjoy from venturesome company managers ambitious to extend their business to new and untried fields.

Our American system appeals to me—with its limitations, its statutory reserves, publicity, and close departmental supervision—as conservative and safe. I cannot satisfy myself that it will be a wise departure—one in the interests of the insuring public—to permit one corporation, either a direct writer or a reinsurer, unlimited privilege to write the various lines of hazard which, under our present system, must be divided among separate corporations. Nor can I satisfy myself that it will be wise to subject the fiduciary or trust funds of a life company to the conflagration hazard, or to the indefinite liability incident to general casualty and miscellaneous insurance.

I wish to leave with you three aspects of the situation for your further consideration in connection with the question before us:

First. Is it not possible that, in allowing the organization of multifield line companies, one of the results will be the elimination of a great many of our smaller, but financially strong one-line companies, and a concentration of the insurance business in the hands of a few mammoth corporations?

Second. Should we not at this time consider the trend of public opinion represented in pending national legislation which seems to be against great corporate entities absorbing smaller ones transacting a similar business? The recently exposed conditions existing in the case of the New York, New Haven and Hartford Railroad is a case in point.

Third. In the time of great disasters, such as the loss of the Titanic, the Binghamton fire, and the conditions which may follow the present war, where great loss of property and life are both involved, is it not safer that the unusual burden should be carried by several separate entities rather than by one?

In the last analysis, is it not true that much of the credit for the amazing growth of business in this country is due to our wonderful success in specialization? The trend of the times is in the direction of the specialist. The great businesses, the economic and professional successes of the country, are largely attributable to specialization. And in this general concentration of effort, it seems to me that we must recognize the specialists in the insurance business. We find able executives and life underwriters guiding the affairs of our great life insurance corporations, and this is equally true of our fire and casualty corporations. Will the same efficiency, wonderful growth, and corporate soundness result when the intricacies of multifield powers are in the hands of one set of executives? I cannot believe that they will.

THE PRESIDENT'S ADDRESS

A Plea for Greater Publicity as Regards Insurance

By Charles H. Holland*
Vice-President, Royal Indemnity Company

THE president's address at this Convention must necessarily be directed in one of two directions; it must either consist of a brief survey of past and current events,—or it must be the expression of one individual's views upon one or more phases of the business in which we are commonly engaged.

When I had the honor of addressing you last year, within the historic City of Quebec, our surroundings suggested a restrospective thought as to our successes and failures of the past; and we together contemplated the practicability of building still more soundly upon the lessons gained by your experience. On this present occasion I wish to confine myself to the consideration of one point of vast importance to us in our business; it is a matter to which I referred briefly at our last convention, when it also received the attention focussed upon it by the very able and powerful address of President John T. Stone, of the Maryland Casualty Company. It is a matter which so insistently and urgently calls for our active attention that I make no apology for once more occupying your time on its behalf.

The business of insurance—one of the most necessary adjuncts of present-day commercial life—is, so far as the public is concerned, enshrouded in mystery. That statement is true to a large degree in respect of those older classes of insurance with which our association is not connected; but to a far greater degree is it true of casualty and surety insurance. There is perhaps a general but undefined belief that life insurance is conducted upon the basis of certain data emanating from the abstruse calculations of mathematicians, that fire insurance has been brought to a certain point—a far from perfect or final point—of scientific exactitude by means of rigorous inspections and elaborate details of a long and comprehensive experience; but of casualty insurance nothing is known outside the confines of our own very limited circle, except that an apparently arbitrary premium is demanded for the insurance of a given risk.

I suggest to you that the time has long since arrived when the great public from which our business is derived should be taken into our open confidence, when the shroud of mystery should be removed, and when the masses of data upon which we rely for our guidance should be made available to all who care to read. The absence of public knowledge of our affairs is in my opinion responsible for the major part of the difficulties which are ever confronting us. The present age is an age of education; if the time ever existed when the public was willing to blindly accept the dictum of a corporation—whether an insurance corporation or otherwise,—that time has, happily, passed. And now the public demands and is entitled to knowledge as to the use to which its insurance investments are put. And I therefore very earnestly welcome the departmental examinations of rate-making organizations, the governmental collation of statistics from our business, the commissions which shall supervise, with just and impartial hand, our administration of such measures as workmen's compensation laws. But even these activities on the part of government officials are of but trifling value to us compared with the enormous influence which would be exercised by a public which had confidence in us because of our openly-displayed confidence in it.

If we glance for a moment at the various bureaus or rate-making organizations which are a necessary part of our business, we can only conclude—as will any impartial student of the subject—that the primary result of those bodies, the prevention of rate-cutting, is a supreme advantage to the great army of policyholders. If a manufacturer of shoes decides to sell his output at less than its cost-price, his customers gain a temporary advantage at the cost of his solvency; he and his comparatively small number of creditors are the sufferers. But if an insurance company sells insurance at less than cost-price, the sufferers are the company's very numerous customers or policyholders—who lose the security

*An address delivered before the Fourth Annual Convention of the International Association of Casualty and Surety Underwriters.

from disaster for which they have paid. And the public does not realize this fact, and consequently condemns rate-making bodies. This is but one, perhaps the most obvious, of the many unnecessary disadvantages which hamper us because of our aloofness in the matter of publishing broadcast the facts and reasonings which actuate us in our methods of business.

Never would any business so gain by the "fierce light of publicity" as would insurance business; and never has this publicity been so necessary to us as it is to-day.

In the State of New York a far reaching step has recently been taken in the formation of a Central Inspection Bureau, under the active supervision of the Insurance Department, for workmen's compensation business; no other step could have so successfully secured the confidence of employers.

The recognition and support by our companies, of the National Association of Casualty and Surety Agents, a body which achieved immediate success upon its formation last year, marks another step in the direction of throwing off the veil of reticence and privacy which has rendered us mysterious—and therefore open to suspicion—in the past.

The existence of that body, with its possible membership of many thousands of active business men scattered far and wide throughout the country, provides us with a new and unique opportunity of attaining—through the medium of its members—an organization of campaigners and educators of public opinion, working in the public behalf and in our behalf with a united whole-souled effort to combat the hitherto unchecked misunderstanding of our methods, our aims and our results. It has been with the greatest possible pleasure and satisfaction that I have assisted in arranging for a joint convention of that association of agents and our own association, to be held during the current week; and I have great hopes that the discussions and exchange of views at that joint convention may result in a well-organized co-operative movement which shall have as its aim the attainment of that still greater cooperation between the public, the agents and the companies.

The need for this confidence between the public and the insurance interests is nowhere more obvious than in the matter of workmen's compensation; the need is perhaps not as obvious but is equally pressing in connection with personal accident insurance, which has been brought to an unprofitable condition by the growth of hazards which were not contemplated when present premium rates—unchanged during many years—were originally formulated. And in other branches of our business activities, nothing but good could follow the adoption of a spirit of mutual comradeship between company and policyholder, between trustee and beneficiary.

I trust that the insurance institutes of this country will without delay enlarge their educational facilities by the provision of regular courses of study and examination, so that the army of individuals engaged in our business may have opportunities of enlarging their knowledge and increasing their influence,—while the nondescript will find that insurance business has been brought to a condition of such scientific accuracy that his untrained efforts can fill no vacancy upon an insurance company's staff. By this means, hosts of young men, each of whom wields some degree of personal power and influence in his community, will continually reinforce us in our endeavor to attain and maintain in the commercial world the respect and support to which we believe we are entitled.

That these are not vain hopes or passing fancies, I am fully convinced. That at this convention we can set in motion machinery which will be of good service to the public and of advantage to our companies I earnestly believe. That the removal of many of our difficulties lies within our own power is a truth which should be constantly before us. And I appeal to you to take the opportunity provided by this convention to formulate such procedure as shall set in motion an irresistible campaign of confidence-begetting education. Thus, and I think only thus, can we successfully accomplish the work which we have undertaken; thus alone can we ensure real and lasting success to our companies; and let us never forget that in the accomplishment of that work we are serving the nation by protecting the individual,—by making sure support for those who suffer, we are serving humanity.

THE RELATION OF THE MEDICAL EXAMINATION OF EMPLOYES TO INSURANCE UNDER WORKMEN'S COMPENSATION LAWS

By Edward W. DeLeon*
President, Casualty Company of America

THE keynote to these remarks is to be found in the doctrine enunciated by the National Conservation Commission, that natural resources are of no avail without men and women to develop them, and that no nation can be permanently great except through a sound and strong citizenship secured and fortified by conserving the chief source of strength through the prevention of accidents and disease and the prolongation of life.

The United States has passed through almost a revolution in the last five years in connection with legislation for workmen's compensation and the prevention of work accidents. It is a strange commentary, however, upon the intelligence of the nation that practically no attention has been given to the most important phase of this question; namely, the conservation of human life, and the prevention of accidents and sickness in industry by means of the periodical medical examination of employes.

I am aware that, in discussing this aspect of the great problem of industrial relations, I am treading upon somewhat dangerous ground, and am, perhaps, embarking upon an almost uncharted sea; but if I succeed in only partially blazing the way through the forest of doubt and distrust on this subject, or if I am destined to steer through the turbulent sea of opposition and discord into a safe and quiet harbor, the voyage will not have been undertaken in vain. The watchword of the age is safety. The slogan of the State and municipality is safety first. Civic authorities are organizing societies to educate the public in the principles of this great human doctrine. Railroad companies, once reputed to represent the epitome of soulless disregard for human life and limb, are spending millions for safety. Life-saving stations stretch in unbroken line from the Atlantic to the Pacific, and from the Great Lakes to the Gulf of Mexico. Traffic police guard our congested highways to regulate the operation of vehicles and to enable pedestrians to use at least a small part of the public streets with comparative safety. Manufacturers, merchants, professional men, and innumerable societies and associations are daily preaching the doctrines of conserving the safety of the great army of industrial workers. Legislation, that is generally the rearguard of all such public activities, has placed the stamp of approval upon this all absorbing question of the day through the enactment of workmen's compensation laws, the fundamental objects of which are to foster every known means of accident protection, and to emphasize the economic value of the well being and the highest efficiency of employes through the prevention of occupational accidents and disease. This humanitarian principle has found expression in forty-one European countries, and in twenty-four States of this country, with every indication that within a few years the

*An address delivered before the Fourth Annual Convention of the International Association of Casualty and Surety Underwriters.

United States will be in the forefront of the enlightened nations of the world in the adoption of every recognized requirement for the amelioration of the condition of work people.

While our own country has thus inaugurated a widespread comprehensive plan of accident prevention and is expending millions for the inspection of plants and machinery, we have done but little in the direction of the physical inspection of workpeople engaged in the great system of human engineering. It is more remarkable that only two of the leading countries of Europe, England and Belgium, have thus far established separate medical divisions in the factory inspection departments. In each of these countries, there is a chief medical inspector, assisted by a corps of competent physicians making periodical investigations of occupational diseases, supervising work in dangerous trades and regulating generally the question of industrial hygiene, including the physical examination of employes.

In England, there are at present two medical factory inspectors whose duties are to advise the Government in all branches of factory inspection requiring medical education; to supervise the work of the certifying physicians; to make investigations and reports on cases of industrial poisoning; to visit all establishments where industrial diseases are predominant; to investigate conditions affecting the health of workers in all factories; to make special investigations and to formulate rules and regulations for new trades and establishments. The medical inspectors report to the chief inspector weekly. They are not permitted to practice medicine. There were in England in 1912 2,279 certifying surgeons and a part of the work done by them was the following: Medical examinations for certificates of fitness, under fourteen, 42,203; between thirteen and fourteen, for full time employment, 11,222; ages fourteen to sixteen, 373,301; total, 506,726. The results of these examinations showed that 491,385 employes were certified and 15,341 were rejected as unfit for employment. In dangerous trades, 231,426 examinations were made, and 681 employes suspended from work. Legislation for the protection of workmen in Belgium began in 1813 with an imperial decree relating to work in mines, until to-day there are few countries that make such detailed and specific regulations for workpeople and particularly for trades regarded as dangerous or unhealthy, called "classified establishments." These industries require authorization to begin operations, which is often a complicated affair, involving representatives from the council of public hygiene, inspectors of dangerous trades and medical commissions. In such trades as phosphorus match manufacturing and white lead making, every worker must undergo a monthly medical examination by a physician, approved by the Minister of Labor. The physician is obligated to keep a record of the results of these examinations, which is open to the board of factory inspectors. The medical division of the inspection department includes the chief physician and two assistants and two or more provincial medical inspectors.

A large number of examinations are made of workers, especially in dangerous trades and the medical inspectors also make a thorough examination of the temperature and humidity of different establishments, and their effect upon the workers. During 1911, two hundred and twelve visits were made in one hundred and twenty-four rag-picking establishments, and all persons working therein were vaccinated. In seven white lead factories in Flanders and Brabant, 2,574 monthly examinations were made, and 735 workers examined, of which number, 115 were found to have symptoms of plumbism. There is no medical factory inspection in France, Austria, Switzerland, Prussia and most of the German States, although in Prussia, district physicians may be called in, particularly for the authorization of certain dangerous trades; and in Austria, a medical consultant has recently been appointed. It may be said, however, that medical factory inspection in Europe is still an undeveloped field, although there is a growing agitation in many of those countries for the appointment of medical inspectors. The United States became interested in the medical examination of employes on some well defined organized basis through the work of the Chicago Tuberculosis Institute whose committee on factories instituted in 1911 a campaign for the detection of tuberculosis among factory workers; this was later extended to an organized system of general medical examinations for the detection of any breaks in the health of employes. The arguments in advocacy of this new step in the development of industrial efficiency were: first, protection of health of the working force by the elimination of sources of infection; second, prevention of physical deterioration of workers by early detection of disease and immediate adoption of remedial measures; third, prevention of unnecessary financial loss to the employer caused by the growing reduction of efficient working power of employes, afflicted with unknown, but slowly developing disease; fourth, a higher standard of health, sanitation and efficiency among the entire working force, accomplished through general instructions and regulations having for their object the increase of resisting power of employes below normal, and the maintenance of health of those in ordinarily sound condition. As a result of the experience gained in the two years' compaign, the committee on factories of the institute, advocated the following plan of systematic surveillance of health of workers; medical examination of all applicants for work, or at least of those whose appearance, or former or present history suggest the possibility of disease, and a more comprehensive and thorough medical examination of applicants for membership in employes' benefit associations with gradual extension of such membership to all employes. The magnificent results achieved by the institute in the last two years is strikingly shown in the experience of several Chicago employers. Dr. Harry E. Mock, in charge of the medical staff of Sears-Roebuck & Co., furnishes the following record of the work in that institution; average number of employes 9,500; number of employes examined in last four years, 6,800; number of cases of tuberculosis found, 193; number of cases of heart and kidney disease existing unknown to the patient until disclosed by examination, 40; number of cases of communicable diseases, including scarlet fever, measles, chickenpox, mumps, diphtheria and venereal diseases, 200. In addition to above, a large number of cases of anæmia, chlorosis, rundown conditions, nervous breakdown and even three cases of insanity, have been found, and in every case, the employes have been given rest from work and placed under proper treatment, either in an institution or in care of their family physicians. Those who could not afford to pay for treatment, have been cared for by the physicians of Sears-Roebuck & Co.

Since January 1, 1912, all applicants for employment in the manufacturing department of the International Harvester Company are examined by one of the surgeons of the company. Prior to the examination, the applicant is required to answer questions regarding his family history, especially concerning any chronic disease, and his personal history, covering especially rupture, rheumatism, consumption, kidney or bladder trouble, fits or, in fact any physical or mental disorder or any defective vision. The medical examination covers the questions of sight, hearing, the heart, lungs, and any defects in hands or arms, feet or legs, spine or joints, head, face or skin. The total number of employes that come under this examination is 22,440 in the manufacturing department, and 918 in the office. Of this number, 18,022 in the manufacturing department and 432 in the office are members

of the Employes' Benefit Association in which examination by a physician is necessary to payment of benefits.

The medical examination of employes at Montgomery, Ward & Company began after July 1, 1912, at which time the system of employes' insurance was installed. Every employe must serve one year before being eligible for insurance. He is then examined and if he proves fit, is accepted, but if his condition is questionable, he is debarred from insurance, as well as from the employ of the company. Examinations are not made at the time of beginning service, for the reason that the working force in this establishment is variable, and at times, hundreds of men and women are employed for only a few weeks. There is no intention of retaining these people, hence, it would be unnecessary to submit them to any examination beyond their ability to do a day's work. In addition to medical examination, a constant supervision of the health of employes is maintained in every department, and with the first symptoms of a break in the health of an employe, the case is immediately referred to the medical department.

Swift & Company in the early nineties, installed a physician in their packing house, whose main duty was to treat without charge to employes, all injuries sustained during work. The treatment of illness was not obligatory, but some of the men soon consulted him in cases of sickness, and it shortly became necessary to employ a day assistant and later a night assistant. At the present time, the medical staff consists of four physicians and one nurse, with the equipment of a first-class hospital and dispensary, where emergency surgery and medical treatment is conducted. The medical examination of employes dates from the organization of Swift & Company's Employes' Benefit Association in 1907, that has at present a membership of 21,879 in the United States and Canada. Examination is required of all employes within the first week of employment to determine: first, fitness for membership in the association that is optional; second, discovery and prevention of spread of communicable diseases; third, discovery of previous illness, injury and defects from the standpoint of possible effects on future injuries; fourth, a sound and healthy working force. Thorough inquiry is made into family and personal history of the applicant with particular regard to susceptibility and probability as a carrier of disease; also with a view of discovering evidences of epilepsy and kindred affections that are especially dangerous in certain occupations requiring climbing and work near machinery. When an applicant furnishes a family history of tuberculosis or any sign of disease, he is reported as a "suspect" and is given a second examination at a later date and is subject to other examinations as often as his case requires.

The examination during the first week of employment, while invaluable for discovering disease or defects in applicants, of course provides no way for ascertaining their physical condition later on. This is partly accomplished through the foremen and department heads who are instructed to send all employes suspected of being ill to the medical department for examination. Timekeepers are required to report to physicians, all employes absent from work for more than two or three days, whether known to be sick or not. Every member of the Employes' Benefit Association, in order to draw sick or accident benefits, must report his disability to the timekeeper, or foreman or to a physician, and in any case, he is examined either at home or at the plant. If, after examination, an employe is found to have some ailment not disabling, but requiring a change in the character of his work, this change is made. It is frequently inadvisable for an employe to resume his former work, after recovering from accident or illness, and in such cases, suitable temporary work is provided until his health is completely restored. Such measures have been found to not only promote the health of employes, but to gain their confidence and co-operation in all medical and sanitary work, with the result that employes who have been treated and cured and have returned to work act as medical missionaries to spread the value of these examinations among the entire working force. The Chicago Telephone Company employs about 11,000 men and women, of which about 6,000 are operators at an average age of nineteen years. A medical department is maintained consisting of four doctors and six nurses, to make examinations of all applicants for the position of operator. The chief operators and manager are instructed to keep a general supervision of their forces and to send to the examining nurse, any employe who seems in any way to need medical attention. There is also a systematic examination by a nurse of every employe in an exchange. In one exchange, out of 158 employes, 30 were sent to the doctor for examination. The question of a general medical examination of all applicants for employment and the medical supervision of all employes generally, is under advisement at the present time. The Commonwealth Edison Company started in October, 1910, to make examinations of all new employes and to exercise medical supervision over all employes. Every six months, an inspection is made of all employes in all departments and no one, from the highest official down, is excused from this examination. Each new employe's vision is tested and any one with less than half vision, if not properly fitted with glasses, is rejected. This rule is strictly followed, particularly with drivers and chauffeurs, linemen and others doing construction work, and all who are compelled to work in close proximity to live wires, or in other hazardous places. About seven thousand employes are examined each year and in addition to regular examinations, all superintendents and foremen are instructed to watch the men under them, and if any weakness or loss of efficiency on the part of any employe is noticed, he is sent to the doctor's office for examination.

Let us now consider the relation of the medical examination of employes to insurance under workmen's compensation laws. While there may be, of course, points of conflict in the industrial relations of employer and employed, there should be, so far as the great basic principles of economy and efficiency are concerned, a profound harmony of interests. The healthy workman is an asset to his employer, for disease and defects mean feebleness, impaired usefulness, irregularity and unreliability. It has only lately been recognized that the economic value of the worker is conditioned more by his physical status than by any other single factor, and that inefficiency due to injury or disease imposes a burden upon society at large, rather than upon the individual. Industrial insurance has for many years essayed to bridge the gap between the disabled workman and the community, but the majority of the systems of industrial insurance in force are defective in that they provide for the payment of benefits in case of disability from sickness or injury, only after these have become facts. Practically all existing systems of industrial insurance fail utterly to give adequate recognition to the great cardinal principle underlying all modern methods employed in the interests of public health; namely, that of prevention. Great attention has been paid to providing the injured or sick employe with medical attendance, but too little care has been exercised to prevent the accident or sickness that renders such medical attention necessary.

The advent of workmen's compensation insurance has emphasized to some extent the advantages of prevention and the primary purpose of such insurance should not be to provide indemnities for injury or death of workers, but should rest upon a preventive basis, largely accomplished through a systematic

medical examination of work people. In no other way can the first beginnings of disease be detected or the adverse effects of unhealthy conditions averted. Such examination must not only disclose bad shop conditions, but should include the worker's entire environment, for it may frequently happen that the origin of the disease is traceable to the unhygienic home, rather than the unsanitary shop. Many employers have already correctly appreciated the value of periodical medical examinations as a *sine qua non* to continued physical efficiency and whenever these have been carried into effect, they have been the means of detecting diseases and defective conditions, in their incipiency, and have made it possible to apply remedies before irreparable injury had been done.

Workmen's compensation insurance, conducted upon this preventive basis principle would soon become an economic necessity in the evolution of modern industrial development, and would redound to the benefit of employer and workman and the State by reducing the annual loss of days through sickness and injury, and by raising hygienic standards and fostering the enactment of uniform industrial legislation. One of the strongest objections urged against workmen's compensation insurance as administered by stock insurance companies has been its cost and this consideration has been most potent in the arguments in favor of State insurance. It is merely a truism to say that any such insurance must needs be costly in which the basic principle does not take into account every phase of prevention. The cost of workmen's compensation insurance, predicated upon preventive lines, would be far below that of a system based upon the theory of providing indemnity only after the employe has been incapacitated or killed. It is also true that the loss reserve is directly dependent upon the average accident frequency, and if by preventive measures, this frequency can be reduced, it follows that the reserve and consequently the cost of the insurance may be lowered, proper provision being made for the expense of such preventive work. The question naturally arises with every employer undertaking this work of medical examination of employes as to the attitude of the workers toward such inspection. In a total of over 20,000 examinations of International Harvester Company's employes, covering a period of nearly three years, not more than twenty objected and most of these willingly submitted to the examination after its purposes had been fully explained to them. If it is frankly and honestly shown that this plan for ascertaining the health and physical condition of employes is one designed to improve their status and to assist those afflicted with disease back to good health, and is not to be used as a means of merely eliminating individuals, the active and willing cooperation of employes may be assumed. In other words, the worker will not suffer loss of time and wages from frequent injuries or sickness when at the age of best production, and will not be sent to the "scrap heap" when there should be many more years of profitable work, if proper hygienic standards are established.

Statisticians tell us that it is a fundamental principle that mortality and morbidity vary in different trades, and in different proportions, so that a trade with a high mortality may have a low morbidity, or vice versa. The necessity for qualified medical inspectors is apparent when considering the aggregate loss of life and health in American industry, and in estimating the probable burden that falls upon wage-earners. It may be conservatively estimated that at the present time the number of workers fifteen years of age and over of both sexes is approximately 35,000,000. At least 40 per cent of this number may be estimated to suffer more or less incapacity from work during the year as the result of sickness or industrial accidents. On the 40 per cent basis, there would, therefore, occur in American industry approximately 14,000,000 cases of disability, which, on an average of 8.5 days per annum per employe, based upon the German experience, indicates that at least 297,000,000 days of sickness per annum occur among the workers of the nation. It is safe to say that the average loss in wages, allowing for contingencies such as malingering and unemployment will be not less than $1.50 per day, and upon that basis the direct monetary loss in wages on account of industrial accidents and sickness may be conservatively figured at $445,000,000 per year. Adding to this sum, not less than $1.00 per day for the expenses, including doctor's bills, nurses, medicines and incidentals, the additional cost on account of industrial accidents and sickness to wage-earners is $297,000,000 per year. This, however, does not represent the total loss to industry, for it may be conservatively estimated that not less than a loss of fifty cents per day results from changes, absences, replacement of efficient workmen by inefficient, and the time spent in instructing new employes to fill the places of those absent on account of disability. An average loss of fifty cents per day, adds $148,500,000. This entire amount, representing the direct loss in wages to the workers, the direct cost of accidents and sickness and the economic loss to industries, reaches the enormous sum of over $1,000,000,000 per annum.

I feel that I cannot close these remarks in any better way than by quoting from a paper on the "Medical Inspection of the Industries" read by Dr. R. L. Wilbur, Dean of Medical Department of Leland Stanford University of California, before the annual meeting of American Academy of Medicine in June of this year. In discussing the advantages of National, State, municipal or private medical inspection, he said: "The combined conscience of society is stirred. The dollar is tottering on its glittering pedestal, and many things are now being measured in other terms than financial profit and loss. The compensation acts show that industry must bear the burden of its Moloch-like existence. It is beginning to try to protect the worker from harm. The by-product of legs and arms and tombstones is becoming less necessary and less productive. The best way to save money is not to spend it, the best way to pay the working man and make him pay is to keep him clean, free from disease and foul surroundings and happy. Society is tired of having its progress stopped by the unnecessary cripples, the blind, the paralyzed, the widow and the orphan. Rat traps ought not to be made at the cost of human life. The washing of towels should not cost us human arms, and we should make dishes and manufacture paint without paralysis or fatal kidney disease as the price. Some factories have found these things out and they are making private inspection pay. The private inspector can be the family physician of the industry. He can watch for the health of his workers, and when properly supported can organize an emergency hospital service; make regular examinations and forestall disease and injury; with full knowledge of local conditions and sympathy with the work, a trained man can do great good. War, as well as industry, has taught us that the first care given the injured is the most important."

BURGLARY CLAIMS AND THEIR ADJUSTMENT

By J. A. Kenny*
National Surety Company

I HAVE chosen to confine my remarks principally to the subject of claims. I do this for the reason that, in my opinion, this side of our business has not received the serious attention and consideration it merits. In the past two years we have made

*An address delivered before the Fourth Annual Convention of the International Association of Casualty and Surety Underwriters.

great strides towards putting the business on a sane, sensible and sound basis. This has been accomplished through the medium of the Burglary Insurance Underwriters' Association. After many trying years we have, at last, seen the futility of going it alone, and decided to protect ourselves against our own folly.

We have, however, directed all our energies to the question of rates and policy conditions. That much progress has been made, none can gainsay. This is evidenced by the unanimity of rates and policy forms now prevailing.

Burglary insurance is of recent origin; it is, now, more or less in an experimental stage. If it is to take its proper place in the economic world, radical changes must be made, not only in the method of underwriting, but in the adjustment and settlement of losses.

Burglary claims may very properly be divided into four groups or classes: The honest claim. By this I mean where a burglary or theft has occurred and the proof submitted represents the actual loss suffered. The mysterious disappearance; the padded or inflated claim; the fake claim. Let us take up the second group. These claims are the most difficult we have to deal with. They have estranged us from our business friends, taxed our credulity, imposed on our loyalty. Because of the very nature of theft insurance, it is almost impossible to determine our liability in advance. We agree to cover against theft, but theft is so indefinite that each case must be judged on its own merits. I do not mean to imply that theft cannot be defined. Our difficulty lies in determining that the loss is due to a theft. One not familiar with the subject might be tempted to say that it cannot be a hard matter to draw the line. There might be a great degree of truth in this, if it were not for several reasons.

In the first place, the agent or broker oftentimes follows the line of least resistence in selling the policy. The prospect asks an explanation of theft insurance, and it is not at all unusual that the inference is given that it "covers everything."

We also have to combat the inherent reluctance of human nature to reconcile oneself to loss of any kind. Personal property which has disappeared is reported as stolen, if theft insurance is carried, whereas if the owner were not insured, other reasons would be assigned for its loss. The mental attitude of one insured against theft has never, in my opinion, been better illustrated than in a case which was presented to our company some time ago. The assured was about to close house for the Summer, and, preparatory to leaving, had requested the Safe Deposit Company to send for a trunk containing silverware. The maid, unknown to the assured, had given an order to an express company to call for her trunk. The expressman called and asked for the trunk. The assured, taking it for granted that he had called for the silverware, gave him that trunk. Later in the day, the company's wagon drove up to the door, the driver stating that he had called for the silverware. Wild excitement! A 'phone message to our office reporting a loss of some $3,000. The assured told our investigator that the expressman had called for the trunk of silverware. Unless recovery was made it looked as if we would be called upon to pay a large loss. A prompt and vigorous investigation brought the facts to light, and incidentally the missing trunk. It developed that the expressman had simply asked for the trunk, and not the trunk of silverware, as stated by the assured. Note the creation of evidence necessary to bring the loss within the terms of the policy. I don't think for a moment that this assured was dishonest, or had the slightest intention of defrauding the company. It simply indicates that the mind of one insured is not always fitted to give an accurate statement. Details which have no existence in fact, are supplied unconsciously, as it were, so that the loss appears to come under the policy.

Let me cite to you some cases that I have chosen at random from our files, which prove conclusively that we are called upon to pay and do pay for property that is simply mislaid.

"We were advised by tha assured that the pearl shirt studs were found by the laundress in a shirt, and the assured therefore wishes to reduce the amount of his claim."

"It is all off.—With tears in his eyes, Mr. ——— waited upon us to-day and informed us that the supposedly lost watch and chain have been found."

"We would respectfully refer to the claim that you paid, which referred to one dozen fish knives, and one-half dozen fish forks. We learn from your assured that these articles have, evidently, been found carefully stowed away, and all regrets for the claim are extended to you."

"I herewith hand you my check, payable to National Surety Company, and am pleased to inform you that the necklace and the jewel, mentioned in my Proof of Loss, have been found. The necklace with the jewel attached as a pendant, were misplaced by my wife, and were not in the jewel box, which was the usual place for keeping them. Yesterday the articles were found in a dresser drawer."

"In making my claim, I claimed for a pin. When my family returned, we found it on the floor under a rug. Enclosed please find my check for same."

"Upon reviewing your file pertaining to this claim, you will observe that, under date of March 4, we sent you a check, the assured having found one of the articles under Proof of Loss. We have much pleasure in handing you another check, the assured having recovered all of the articles supposed to have been stolen."

In each of these cases the assured was insistent that the property had been stolen. I could continue in this strain indefinitely, and the files of every company will disclose similar cases. How many thousands of dollars have we paid for supposedly stolen property which afterwards turned up, and for which we were not reimbursed!

I now want to say that the most difficult influence and pressure which we have to overcome is brought to bear upon us by the broker or agent. He tells us that the assured is an honorable man; stands high in the community; a representative citizen and that his account is a valuable asset, and if we expect any more burglary business from him, we had better stop quibbling and pay the loss. I have no words of censure for the broker, but rather for ourselves. We invite and encourage the practice; we welcome with open arms the disappointed broker, who has had some claim turned down by a competitor. We applaud ourselves if he patronizes our company. It is an endless chain. By the time a former customer has been the rounds, time has healed the sore, and in our anxiety for new business, we paint him an alluring picture—tell him that we settle our claims differently now, and great is our joy at his return!

My company about a year ago declared unequivocally that it would not pay mysterious disappearance losses. What was the result? A loss of premiums to the extent of about $50,000 in one year, all because we took the stand that we would not pay for losses which we never agreed to cover, and for which we were not liable. Other companies secured this business because the brokers felt that losses of this nature would be paid; yet, surely no company openly professes to pay for mysterious disappearance.

The claims, which are also costing us dearly, are the padded or inflated claims. A lot of people go on the theory that an insurance company is legitimate prey. People, who are honest in other things, have no scruples about putting an exorbitant value on property for which they make claim. They consider it about as dis-

honest to cheat an insurance company as they do to avoid paying their fares to the street car conductor, and others believe that the company will cut down the claim anyway, so they jack up the values.

Here, again, we have most to fear from our "best people." They are prone to value too highly property for which bills are not available, and render us little or no assistance in our endeavor to establish the correctness of the values. In fact, as a rule, they show their displeasure and resentment in no unmistakable terms, if we, even as much as intimate that we would like more light upon the figures submitted.

I am convinced beyond a doubt that the saving which would be effected on these claims alone, if handled properly, would enable us, without loss to ourselves, to put the rate for theft insurance back to what it was a year ago. I ask if it is not a fact that property which has been recovered after the claim has been paid, seldom, if ever, proves to be worth the price we paid. In some instances, the difference between its real value and the amount of indemnity allowed is startling. This is particularly true with regard to furs and jewelry.

The fake claim is becoming more frequent; nearly all forms of insurance offer, to the unscrupulous, opportunities to make easy money. But where do these opportunities so abound as in our business? About two years ago one of our assured conceived the idea of making a fraudulent claim upon us. He staged it so well that the company was about to pay the full amount of the policy; had it not been for an anonymous communication, check would have been sent. The clue which was given us was energetically investigated, and we succeeded in unearthing all the facts, and upon confronting the assured with the evidence of his guilt, he broke down and confessed. We were not satisfied to take a complete release, but prosecuted the assured and succeeded in having him sent to the penitentiary. I hesitate to dwell here upon these claims, except to say that it were well to realize our danger and to take steps for our mutual protection.

What is the remedy? To my mind there is only one remedy. We must strive for the same co-operation in the adjustment of claims that we have secured, in such a remarkable degree, in other matters.

We have been facing a rapidly increasing loss ratio in the past few years, and have endeavored to overcome it by restricting our policy and increasing our rates, except in localities where we write but little business. I have always believed that was the wrong way. It may afford us temporary relief, but no lasting good can come of it. Our rates are now so high that the insurance appeals only to those who can least afford to be without it, and if too great a percentage of our business is in this class, no rate, no matter how high, will prove adequate.

Most burglary underwriters contend that the rising loss ratio is due to an increase in robberies. I am inclined to doubt it. A business that is growing as rapidly as ours, should show an unusually low loss ratio, while, on the contrary, the reverse is true. The real reason is, I believe, due to the manner in which we have been adjusting our losses. We are paying claims for which we are not liable; we are allowing values that are exorbitant; we are becoming more and more the prey of the faker. Our policies and our rates are uniform; our adjustments are of the "fifty-seven varieties."

We are engaged in a business where moral force counts for more by far than in any other form of insurance, therefore, let us take a united stand on claim matters. Let us, one and all, refuse to recognize mysterious disappearance. Let us put the mysterious disappearance clause back in the policy. Let us get together and discuss the situation seriously. I even dare to hope that we might have an adjustment bureau. In that event the influence of a large account would have no bearing on the loss. The assured, who becomes indignant if we even intimate that his values are a trifle high, would receive courteous treatment, but would be compelled to produce proof to substantiate the correctness of his values. What a great influence a bureau of this kind would exert! It would not take very long to educate the broker and the assured to the new order of things. Instead of the varied and vacillating methods now in vogue, we would have a searching and rigorous investigation, and a uniform policy of adjustment. Switching business because of claim settlements would be a thing of the past; we would cease to be the victims of our own shortcomings.

There are men who retard progress in every profession, and there are, we are sorry to say, brokers who have been implicated in fraudulent claims and who are still doing business. We should not temporize in matters of this kind. With a good organization behind us, we could put ourselves in an impregnable position by eliminating a few bad brokers and help place brokerage business on the high plane that so many in that profession are striving for.

As I view the future of our business, its growth, development and success lie in lower rates, co-insurance and eternal vigilance in claim matters.

THE ADVANTAGES AND OBLIGATIONS OF MEMBERSHIP IN THE STEAM BOILER AND FLY-WHEEL BUREAU

By J. W. Rausch*
Maryland Casualty Company

IN introducing the subject assigned to me, it is not out of place to portray the conditions under which the business of steam boiler and fly-wheel insurance was conducted prior to the formation of the bureau, in such fashion that the advantages gained with its organization will be so apparent as to knit together, as it were, into closer relationship the several members for further advantageous co-operation.

Those of you who had to do with steam boiler and fly-wheel insurance during the several years prior to the organization of the bureau are familiar with the rate-cutting conditions which then existed, and I am sure that those underwriters who were personally responsible for the outcome as to whether there would be a deficit or a margin of profit at the end of the year will not easily forget those times. There was absolutely no co-operation of any kind between the several companies writing these lines, either as to rate computation or practices. Risks comprising various kinds of vessels, such as locomotives, tanks, drying cylinders, sulphite digesters, etc., were very often grouped and a rate made at a flat price per vessel, this notwithstanding the very wide difference in hazard. Sulphite digesters, for instance, are usually of enormous size, the average probably being eighteen times as great in cubic capacity as a 150 horsepower boiler. Then, too, by reason of the behavior of the structure under working conditions when a single covering plate is used in the construction of the longitudinal joint, certain stresses and strains are produced, which, after a time, weaken the structure, producing an additional element of hazard and an uncertainty not often discoverable by inspection —yet the premium quoted was often the same as a boiler premium, and frequently a cut rate boiler premium. Underwriters, in order to prevent business from going from their books, frequently accepted renewals at cost, this with the hope that by giving the

*An address delivered before the Fourth Annual Convention of the International Association of Casualty and Surety Underwriters.

assured the very best service in the way of inspection it would be possible to get an increased premium at the next renewal. However, it was usually found that other companies were perfectly willing to make a still further cut, so that the premium, less commission, would often be less than the actual inspection cost, to say nothing of taxes, management expenses and the carrying of high line of insurance gratis. This rate-cutting, in view of the fact that many other lines of insurance were being written on a safe and sane basis, and according to bureau rules and practices, was not only illogical, but appeared to be altogether unnecessary, and an attempt was made to bring the companies together with a view of forming a bureau, but the response was not at all encouraging and the matter was dropped. In the meantime, some of the companies, especially those having a small line of boiler and fly-wheel business, realizing the fallacy of conducting a business where a net loss was inevitable, withdrew from the field, so that from time to time something like ten companies reinsured their boiler and fly-wheel business. As conditions did not improve, but were actually going from bad to worse, another attempt was made to bring about bureau rules and practices, with the result that at a meeting held on March 3, 1911, practically every company was represented, and at a later meeting held on June 29, a committee of four was appointed to receive suggestions and to formulate recommendations as respects steam boiler, fly-wheel and use and occupancy underwriting practices, standard policy provisions, rates, etc. The work assigned to the committee, notwithstanding that it worked diligently, was necessarily slow, this on account of the many and varied conditions which had to be met and dealt with in a practical way. However, it is not my intention to go into the details of the work done by this and other committees. You are all more or less familiar with what transpired from time to time, but what we are all interested in is the practical result accomplished, which, in the case of this bureau, is most gratifying. It is true, therefore, that in abolishing vicious practices this bureau has conferred great advantages of a most practical nature upon its members. Such a result, even though negative, would fully justify your support of the organization, but there have been other results of a definitely affirmative nature.

The bureau has now been in successful operation slightly over a year and everything appears to be working very smoothly indeed. As might have been expected, at the outset there were some complaints, and, of course, there will be complaints from time to time, but as a whole everything is working very well, and the complaints, for the most part, are usually found to have been groundless upon investigation.

After reviewing the conditions prior to and since the formation of the bureau, the advantages gained by membership are obvious. It has brought order where chaos existed. It has established standard and uniform practices. Instead of a deficit, the business as now conducted should, unless the loss ratio is abnormal, afford at least a small underwriting profit. The new manual which has just been completed, is a big improvement and will simplify rate computation. Then, too, prior to the organization of the bureau, underwriters, at least for the most part, knew very little of each other in a personal way. The impressions gathered were usually from the field, and it is natural that in view of the conditions which then existed, such impressions were as a rule erroneous and very often anything but favorable. Since the formation of the bureau, however, all this has been changed. Officials, underwriters and representatives of the several companies have met in friendly intercourse, with the result that any unfavorable impressions which may have been gathered were dispelled. Surely this getting together and the establishment of a friendly feeling between the representatives of the several companies is well worth membership in the bureau.

Our obligations as members of the bureau are clear and specific. A vast amount of time and labor has been expended in building up a successful organization, and it is therefore the duty of each and every member to do everything possible so as to promote harmony and strengthen the organization. Bureau rules should be strictly adhered to in spirit as well as practice. Differences of opinion will arise, of course, from time to time, but such differences can be adjusted if we will bear with each other, draw on our patience and employ a willingness to co-operate. The desire to co-operate should be considered a personal obligation by each and every underwriter and representatives of the companies. With the combined efforts of our forces, the work already accomplished will be strengthened and will enable us to successfully dispose of those things which are yet to be done. It must be borne in mind that if the bureau is to be a real success, we must all recognize that what injures one inevitably injures all (including that one who may see some temporary advantage to himself in another's injury), that what standardizes, elevates and improves the whole, benefits each company separately and that public confidence is gained thereby and is lost by rate-cutting and mud-slinging practices. Hence it is an obligation upon every member to stand steadfastly in real support of bureau rates and rules, and to devote his best thought to suggesting and helping to consummate ways for the enlargement of the bureau's usefulness. No company should look at the bureau primarily as an instrumentality for the improvement of its own business, but as a means by which every company's business will be improved, in which process he will necessarily share most who helps most.

There are, of course, a number of things yet to be done, and I will take the liberty of calling attention to at least one feature, which, it seems, the bureau should take up as soon as possible, and that is to adopt a more logical method of rating boilers. The boiler, like all other apparatus, has undergone rapid development. From the 80 horsepower boiler in the early days the units have been increased in size until boilers of 1,000 horsepower are now not uncommon, yet if we will review the underwriting practices, we will have to admit that we have not kept pace with this development. In fact, as respects the rate per boiler, absolutely nothing has been done to harmonize the premium with the hazard. The premium charge for the smallest boiler for a given amount of insurance is exactly the same as the premium for a 1,000 horsepower boiler. This method is not only illogical, but is absolutely unfair, both to the assured and the insurance company. For certain economic reasons boilers from 500 to 1,000 horsepower are now in common use, especially at the large plants, whereas sometime ago a 100 horsepower boiler was probably the average. From this it will be seen that if we take a 2,000 horsepower plant composed of two 1,000 horsepower units, we will only receive one-tenth of the premium that we would receive if the boilers were all of 100 horsepower, and I am sure that anyone familiar with boiler insurance will admit that the premium for an average size horizontal tubular boiler is none to great. The argument has been advanced that since there are only two boilers to inspect instead of twenty, the inspection expense must necessarily be that much less, and further, since the boilers are of the water tube type, the hazard is also less, but on the contrary, the expense is not only as great, but the inspection is much more unsatisfactory, and the hazard, instead of being less, is actually greater. The massive heavy walls and arches of water tube boilers retain the heat to such an extent that the time alloted for cooling and inspection is usually so limited as to make the conditions under which the boiler is inspected almost intolerable. Then,

too, the water tube boiler is of such construction that of the hundreds of tubes only certain ones are accessible by hammer test, and, of course, the condition of the others must be judged by those outside tubes which are accessible. Also, since it is well known that after tubes have been in service for a certain length of time they are liable to fail or explode without warning, we have here another element of uncertainty impossible to guard against. It is not my intention to go into a lengthy argument as to the safety of water tube boilers versus horizontal tubular boilers, except in a brief way and that only in order to more clearly bring out the fact that the present method of charging a flat price per boiler, regardless of size and construction, should be changed as speedily as possible. Notwithstanding claims to the contrary, we all know that water tube boilers do explode, that there are any number of accidents where the property loss alone is from $10,000 to $50,000, and we have had at least two practical examples within the last few years, where the property loss was over $100,000. It is therefore apparent that if the premium income is sufficient to afford a small margin of profit, the owner of the small boiler is paying more than his share and the owner of the large unit is paying altogether too little for his insurance, and please bear in mind that this condition exists in the face of the fact that at the present time the premium on nearly all classes of insurance is based on some analytic scheme of merit rating.

NOTES ON INSURANCE, AMERICAN AND FOREIGN

The Proposed War Revenue Measure as Affecting Insurance.—On September 21 there was introduced into the House of Representatives by Representative Underwood a bill, under title of H. R. 18891, "to increase the internal revenue, and for other purposes." It was then referred to the Committee on Ways and Means and ordered to be printed. The measure proposes a special stamp tax to be levied on various forms of document, among others contracts of insurance. The sections dealing with the application of the provisions of the bill will be found on other pages of this issue.

The provisions of Schedule A applicable to insurance are as follows:

"Stamp Taxes."

"Bond: For indemnifying any person or persons, firm, or corporation who shall have become bound or engaged as surety for the payment of any sum of money, or for the due execution or performance of the duties of any office or position, and to account for money received by virtue thereof, and all other bonds of any description, except such as may be required in legal proceedings, not otherwise provided for in this schedule, 50 cents."

"Insurance (life): Policy of insurance, or other instrument, by whatever name the same shall be called, whereby any insurance shall hereafter be made upon any life or lives, for each $100 or fractional part thereof, 8 cents on the amount insured: *Provided*, That on all policies, for life insurance only, issued on the industrial or weekly-payment plan of insurance, the tax shall be forty per centum of the amount of the first weekly premium. And it shall be the duty of each person, firm, or corporation issuing such policies to make within the first fifteen days of every month a sworn statement to the collector of internal revenue in each of their respective districts, of the total amount of first weekly premiums received on such policies issued by the said person, firm or corporation during the preceding month, and upon the total amount so received the said person, firm, or corporation shall pay the said tax of forty per centum: *Provided further*, That the provisions of this section shall not apply to any fraternal, beneficiary society, or order, or farmers' purely local co-operative company or association, or employees' relief associations operated on the lodge system, or local co-operation plan, organized and conducted solely by the members thereof for the exclusive benefit of its members and not for profit.

"Insurance (marine, inland, fire): Each policy of insurance or other instrument, by whatever name the same shall be called, by which insurance shall be made or renewed upon property of any description (including rents or profits), whether against peril by sea or on inland waters, or by fire or lightning, or other peril, made by any person, association, or corporation, upon the amount of premium charged, one-half of 1 cent on each dollar or fractional part thereof: *Provided*, That purely co-operative or mutual fire insurance companies carried on by the members thereof solely for the protection of their own property and not for profit shall be exempted from the tax herein provided.

"Insurance (casualty, fidelity, and guaranty): Each policy of insurance, or bond or obligatien of the nature of indemnity for loss, damage, or liability issued, or executed, or renewed by any person, association, company, or corporation, transacting the business of accident, fidelity, employer's liablity, plate glass, steam boiler, burglary, elevator, automatic sprinkler, or other branch of insurance (except life, marine, inland, and fire insurance), and each bond undertaking or recognizance, conditioned for the performance of the duties of any office or position, or for the doing or not doing of anything therein specified, or other obligation of the nature of indemnity, and each contract or obligation guaranteeing the validity or legality of bonds or other obligations issued by any State, county, municipal, or other public body or organization, or guaranteeing titles to real estate or mercantile credits executed or guaranteed by any fidelity, guarantee, or surety company upon the amount of premium charged, one-half of 1 cent on each dollar or fractional part thereof."

"*Provided*, That upon each and every assignment or transfer of a mortgage, or policy of insurance, or the renewal of continuance of any agreement, or contract, a stamp duty shall be required and paid at the same rate as that imposed on the original instrument."

The section of the Act regarding the length of time during which the above taxes shall be imposed (Sec. 20), will be found on page 391.

* * *

Sepember Insurance Conventions.—We give below an outline of the results of the principal September insurance conventions this year, with a record of the officers elected for the ensuing year.

* * *

Health and Accident Underwriters' Conference.—At the meeting of the Detroit Conference, which took place at Atlantic City on September 9, 10 and 11, two important results were accomplished. The title of the association, which has always been an ill-fitting misnomer, was changed to the Health and Accident Underwriters' Conference; and the two other important accident associations, viz., the American Association of Accident Underwriters and the National Mutual Union were absorbed and welded into one large effective body.

Each of the three organizations held its separate meeting, several important papers being read and various committee reports being made, as announced in these columns in earlier issues. Each organization then voted, after more or less prolonged discussion, to amalgamate in the new association. L. H. Fibel, H. G. B. Alexander, A. F. Forrest, Danford M. Baker, A. M. Johnson, C. H. Boyer and Leonard McNeill stood out most notably in the proceedings,—Mr. Fibel as a valiant fighter for the continuation of the Detroit Conference along its original lines, Mr. Boyer and Mr. Johnson as champions of the American Association of Accident Underwriters, Mr. Alexander, Mr. Baker and Mr. Forrest in the broader role of peacemakers.

The following officers were elected for the new conference for the coming year:

President—R. Perry Shorts, vice-president, Massachusetts Bonding and Insurance.

First Vice-President—C. W. Ray, secretary, Hoosier Casualty.

Second Vice-President—C. A. Craig, president, National Life and Accident.

Secretary—J. B. Sackett, manager casualty department, Old Line Life.

Treasurer—C. H. Brackett, president, Hoosier Casualty.

Executive Committee—D. M. Baker, Pacific Mutual Life, chairman; A. E. Forrest, North America Accident; W. R. Sanders, American Liability; F. L. Miner, Bankers Accident of Des Moines; C. H. Boyer, National Life U. S. A.; W. C. Goodall, Bankers Accident of East St. Louis; Frank H. Goodman, Home Accident and Health.

The National Association of Life Underwriters.—The twenty-fifth annual meeting of the National Association of Life Underwriters was held this year at Cincinnati, on September 15, 16 and 17. The regular programme, as announced earlier, was successfully carried out. The following resolutions were recommended by the executive committee and subsequently adopted:

"That the National Association co-operate with the National Conference of Charities, like bodies to investigate the relation of life insurance, or the lack of it, to poverty, dependency, delinquency, illiteracy, vice and crime, with the idea of placing before the country the data secured as to the effect of life insurance in reducing the number of dependent widows, orphans; that the publication committee hereafter shall consist of three members, the president and two members of the executive committee selected by him; that the association endorse the movement to create a National Department of Health with a member of the President's United States Cabinet at its head; that vigorous protest be entered against the reported proposal of Congress to impose a Federal stamp tax on life insurance and the insurance commissioners' convention be requested to co-operate; that local association hold annual meetings either in January or February; that local secretaries furnish reports of all meetings to the Association News; that companies and commissioners be requested to co-operate in securing the elimination of crooked and unworthy agents from the business; that the constitution be amended to define a regular, legal reserve company as one incorporated, operated, and supervised under legal reserve laws and which does not by any device of corporate form seek to avoid accountability or supervision under said laws, does not indulge in special contracts or stock-with policy schemes or other deceitful device as an inducement to take insurance, does not practice extravagance under the cloak of any valuation device, does not inflate its assets by the device of antedating policies of new insurance and does not in any other way depart from the true Old Line principle of scientifically adequate reserve consisting of genuine assets, and that the subject of State insurance be placed on the programme of the next annual meeting for two hours' discussion."

The following officers were elected for the ensuing year:

President—Hugh M. Willet, Atlanta, Ga.

Vice President—E. A. Woods, Pittsburgh, Pa.

Second Vice-President—J. N. Russell, Jr., Los Angeles.

Third Vice-President—A. J. Meikl john, Toronto, Canada.

Secretary—J. Henry Johnson, Oklahoma City, Okla.

Treasurer—H. Wilbert Spence, Detroit, Mich.

Executive Committee—Thomas B. Sweeney, Wheeling, W. Va.; William M. Furey, Pittsburgh, Pa.; F. M. Cheney, St. Louis, Mo.; C. C. Dabney, Nashville, Tenn.; Wilson Williams, New Orleans, La.; John A. Torry, Toronto, Canada; M. M. Mattison, Anderson, S. C.; H. D. Neely, Omaha, Neb.; Charles W. Orr, Fort Wayne, Ind.; Charles B. Palmer, Wilmington, Del.; George W. Farley, Toledo, O.; Henry Farmer, Detroit, Mich.; Ira B. Mapes, Kansas City, Mo.; Lucien Brown, Birmingham, Ala.; Frank G. Parker, Topeka, Kan.; Oscar Palmour, Atlanta, Ga.; D. R. Midyette, Richmond, Va.; W. H. Harrison, Louisville.

W. A. R. Bruehl, Sr., chairman of the Committee on Registration, Credentials and Information, reported the official registration at 728. Non-members of the association who are in attendance bring the grand total up to 822.

The National Convention of Insurance Commissioners.—The course of the forty-fifth annual meeting of the National Convention of Insurance Commissioners, together with several of the papers read before that body, was recorded in our issue of September 19. The most important actions taken by the convention are summarized by the "Weekly Underwriter" as follows:

(1) Law recommended prohibiting issuance of life insurance policies without reservation of the right to defer policy loans sixty days, in view of present conditions.

(2) Loss Bureau plan of the National Board of Fire Underwriters approved and recommendations for standard classifications of fire hazards and loss report forms, made.

(3) Uniform law for standardization of taxes and fees recommended.

(4) Mutual fire insurance company law proposed.

(5) Underwriting annexes; sub-committee appointed to frame uniform bill for regulation.

(6) Agency qualifications; sub-committee appointed to frame uniform bill for regulation.

The officers elected for the coming year are given below:

President—John S. Darst, West Virginia.

First Vice-President—Burton Mansfield, Connecticut.

Second Vice-President—John T. Winship, Michigan.

Secretary-Treasurer—Fitz Hugh McMaster, South Carolina.

The International Association of Casualty and Surety Underwriters.—The fourth annual convention of the International Association of Casualty and Surety Underwriters was held on September 22-25, at White Sulphur Springs, West Virginia. The programme of the convention is given, in brief, below:

September 22, Morning.—Addresses of Welcome; President's Address; Reports and Announcements. Evening.—Presentation of George E. McNeill Medals. Personal Accident and Health Section (Mutual and Assessment Companies)—Report; Address, "Accident Insurance for Commercial Travelers," Henry D. Pixley, Commercial Travelers Mutual Accident Association of America; Address, "Co-operative Insurance in the West," W. H. Butts, Western Travelers Accident Association; Address, "Co-operative Insurance in the East," Ira F. Libby, Commercial Travellers Eastern Accident Association; Address, "Accident Insurance and Health Insurance, How They Work Together," Ernest W. Brown, Inter-State Business Men's Accident Association; Address, "Statistics, Their Value, and How to Keep Them," Theo. M. Glatt, Chairman of the Board of Directors Commercial Travelers Mutual Accident Association of America; Address, "The Interests of Assessment and Mutual Insurance"; Reports and New Business.

September 23, Morning.—Liability Section—Report; Address, "The Relation of Medical Examination of Employes to Insurance

Under Workmen's Compensation Laws," Edwin W. De Leon, Casualty Company of America; **Personal Accident and Health Section (Stock Companies)**—Report; Address, "Shortening the Period of Convalescence in Personal Accident and Workmen's Compensation Injury Cases," Carl Fallén, M. D., late Director Zander Institute; Reports and New Business; **Fidelity, Guaranty and Surety Section**—Report; Address, "Insect Thinking vs. Insurance Thinking," R. H. Towner, of the Towner Rating Bureau; Reports and New Business. Afternoon.—**Plate Glass Section**—Report; Address; Reports and New Business; **Burglary Section**—Report; Address, "Burglary Claims and Their Adjustment," J. A. Kenny, National Surety Company; Report and New Business; **Steam Boiler and Fly-Wheel Section**—Report; Address, "The Advantages and Obligations of Membership in the Steam Boiler and Fly-Wheel Bureau," J. W. Rausch, Maryland Casualty Company; Report and New Business.

September 24, Morning.—Joint meeting between the International Association of Casualty and Surety Underwriters and the National Association of Casualty and Surety Agents; Topic for Discussion, "Co-operation"; Address, "Workmen's Compensation," Hon. C. H. Crownhart, Chairman Industrial Commission of Wisconsin; Address "Modern Problems of Stock Insurance Companies," Professor A. W. Whitney, General Manager Workmen's Compensation Service Bureau; Other Addresses.

September 25, Morning.—Appointment of Nominating Committee; Discussion, "Is There Need for a Separate Association for Accident Insurance?"; Election of General Officers; Election of Vice-Presidents and Sectional Standing Committees; Unfinished Business; Adjournment.

It is impossible at this time to give an adequate report of the work done by the convention, but several of the addresses delivered will be found on other pages of this paper.

National Association of Casualty and Surety Agents.—The following is the programme of the second annual convention of the National Association of Casualty and Surety Agents held at White Sulphur Springs, West Virginia, on September 21-23:

September 21, Morning.—Address of Welcome; Address, "Agents' Qualifications," Hon. J. A. O. Preus, Insurance Commissioner, State of Minnesota; President's Address; Report, Amendments and Resolutions.

September 22, Morning.—"Education and Conservation," Hon. Willard Done, San Francisco, Cal.; "Agents in Public Life," Thos. F. Daly, Denver, Col.; "Necessity and Benefits of Organization," W. S. Diggs, Cincinnati, Ohio; "State Insurance," E. W. Davis, Cleveland, Ohio; Ten-minute talks by various members on State insurance conditions—present and prospective.

September 23, Morning.—**Fidelity and Surety Section**—"The Necessity of Surety Education," J. L. Humphrey, of Humphrey & Ewing, St. Louis, Mo.; "Contract Bonds," Harve G. Badgerow, of Rockwood-Badgerow Company, Chicago; "The Relation of Brokers to the Surety Business," J. E. Livingston, of Whitaker, MacNaughton & Livingston, Detroit; "Depository Bonds," E. A. St. John, President, Joyce & Co., Chicago; "Judicial Bonds," Richard Deming, Vice-President, American Surety Company, New York; **Accident and Health Section**—Informal discussion of points of common interest by members of the convention; Introduction of resolutions and reports; Election of officers.

INSURANCE NEWS IN THE WEST

State Insurance Agitation Throughout the West.—Unless all signs fail there will be a tremendous fight on the subject of State insurance in the West when the legislatures convene in January. Emissaries of the Ohio Industrial Commission are reported as actively at work in various States, urging the adoption of the State fund plan of that State. The Missouri Senatorial workmen's compensation commission drafted a bill and it was put out tentatively in order to get public opinion. Immediately it is reported that men from Ohio have been in the State endeavoring to work up sentiment against it. Industrial Commissioner Garst, of Iowa, has sent a communication to the Governor asking him to recommend that the compensation law of that State be amended to provide for the State fund plan of insurance. In Minnesota, State insurance has been defeated in the Legislature two or three times, but there is no reason to believe the sentiment is dead. Should Wisconsin adopt the proposed constitutional amendments, its Legislature in January may be considering actual State insurance with the policies guaranteed by the State. Everybody expects a fight in Indiana, where the compensation commission is headed by a labor union attorney who not only favors the State fund plan but is a bitter enemy of the casualty companies. In Illinois not very much is heard about State insurance, but Governor Dunne has strong radical leanings and Insurance Superintendent Potts has shown himself far from friendly to stock insurance companies, especially fire companies. The Fall election in Ohio may settle the State fund plan in that State. If Governor Cox is re-elected there is practically no question that the present plan will continue during his second administration. If the Republican candidate is elected, however, some of the casualty men of the State believe that the compensation law will be amended to permit stock insurance as well as that of the State fund.

Meanwhile, this coming fight is being prepared for by the agents. At White Sulphur Springs this week the general agents assembled had hammered into them from every angle the lesson to organize, to co-operate with each other, with the public and with the companies, to educate the public on sound lines, to take an active part in public affairs. The men who attended the meeting are leaders in their States. They return home determined not to have happen to them what happened to the agents of Ohio and West Virginia if they can prevent it. Some of them are active in State federations of agents and others are ready to become so. If the executive committee of the National Association of Casualty and Surety Agents decides to employ a manager, as President Fetzer recommended, and it is able to secure the right man at once, he will do much to organize the fight for the protection of the business of the members.

* * *

Plans for the Northwest Fire Insurance Meeting.—How the idea of co-operation has taken hold among the fire insurance men of the West is illustrated by the programme for the Northwest meeting, issued last week, on which appear as the title of three successive paper on the first afternoon: "Co-operation," "Competitive Co-operation," "Team Work." The authors are two field men and one local agent. The annual address will be delivered by W. E. Haines, secretary of the Ohio Farmers, that wonderful company that grew great, operating in two States and writing largely a farm business during a period when only a very few stock companies would touch farm business in Ohio and Indiana. The technical address will be by A. R. Small, superintendent of the label service of the Underwriters' Laboratories. The leading candidates for the presidency are B. L. West, assistant Western manager of the Insurance Company of North America, and W. A. Blodgett, vice-president of the American Central.

FINANCE AND COMMERCE

Financial and Commercial Review.
Banking Situation at Home and Abroad.
Statistics of Cotton and Coffee.
Market Prices of Securities and Commodities.

A FEW things are being done and many things are being said which seem to take too little account of the possible effects of the European War on measures and projects for facilitating the recovery of business and banking activities. The great big fact which has to be kept in mind is that we are not now engaged so much in preparing to deal with the situation which will exist after the conclusion of the war as in coping with the conditions which the war has created and which will, with considerable variation, exist during the war. Much that is being done now will have to be undone after the war and the work of undoing it will constitute a post-bellum problem wholly apart from the tasks of post-bellum reconstruction. There is altogether too much blatant advertisement of advancing prosperity and the noisy optimism which persists in displaying itself increases the difficulty experienced by the leaders of the banking and business community and the heads of Government in meeting the exigencies of the war.

It would seem to be fundamental in all present reasoning that steps must be taken very slowly by finance and business in a world subject to the shocking turns of the catastrophic conflict abroad. It would seem far more reasonable to suppose that the immediate improvement of financial and business circumstances can only be carried up to a certain point or from point to point as the fortunes of the war permit. The really important British naval reverse in the North Sea reported this week was very disturbing of assumptions that British naval supremacy would remain unchallenged, and was a reminder that the outcomes of this war are not assured by a preponderance of American sympathy with the cause of the Allies. There is naturally vast impatience with the prospect of hardship which the war holds out for the American people in the near future, impatience mingled with resentment, but there is grave danger in pushing too rapidly schemes that seem to contemplates a restoration of all facilities as they were before the war and as though the result, the length and the contingencies of the war were more or less certain.

So far very much in the way of maintaining our economic position has depended on the success of plans for the rehabilitation of the London money market, but even British finance does not ignore the adverse possibilities which the war holds out and is not at all inclined to anticipate the future with any degree of rapidity. Confident as we are of our ability to maintain American neutrality and confident as we are in the strength of the enormous actual or potential resources of American wealth to cope with the emergencies of the war, we cannot apply those resources and make them effective as though our political exclusion from the area of war carried with it an economic exclusion.

It is accordingly gratifying that finance and business, in cooperation with the Government, are only moving step by step in dealing with the phases of this crisis, and are feeling their way but slowly despite the multiplicity of plans invented for suddenly making everything as it was before the war, and despite the vociferous clamour of the advance agents of the new prosperity. The first adoption of imperative emergency measures has been followed by careful examination of every problem that has presented itself for solution, by intelligent selection of those which could first be dealt with, and by diligent efforts to discover just what would be the consequences of putting into effect devices to fit the needs of the moment. Anything else would be recklessness and invite the risks of disaster. A whole set of formidable problems has not even been taken up for consideration, as, for example, the question of resumption of business in the securities market, and postponement cannot be protracted in the case of any of them.

Nevertheless there is encouragement in the painstaking headway that has been made, and there is more encouragement in the evidence of an intelligent appreciation of the lessons taught by the war which is being manifested in various quarters, notably in political circles. The war tax bill which Congress has been framing is not a miracle of legislative discernment but the nature of the emergency taxes is of very trifling import compared with the drastic revision of the river and harbor bill in the interests of economy. If Congress has discovered the vice of public extravagance we may be sure that private thrift is already in practice and economy, public and private, is going to help wonderfully in the material readjustments required by the war.

Nor when political portents are under discussion, should the reopening of the Eastern rate case be neglected. The ready agreement of the Interstate Commerce Commission to grant a rehearing in this matter implies a deep change in political attitudes which nothing but the war has compelled, but it is a change which must have profound and far-reaching effects on public policy in the business field. The relief for which the railroads have appealed is not assured by a reopening of the Eastern rate case, but it is difficult to believe that appreciation of the emergency which has led to a reconsideration is going to have an issue unfavorable to railroad contentions. The disposition of the case can hardly fail to be extremely significant of the new political disposition which the war is making necessary.

We are of the opinion that the betterment of business and banking conditions is going to be very limited until the cotton exchanges are reopened. A department of trade which is peculiarly American is almost completely suspended in the suspension of the future cotton markets, and finance is hobbled by the paralysis of the cotton movement. Of course, some very important consuming markets for cotton have been absolutely closed by the war, but compensations are precluded by the embargo under which the cotton trade lies. As for the securities market, it is altogether unlikely that the banking situation which is not good can become good as long as the stock exchange is closed. Indeed it is probable that the banking position will tend to get worse rather than better on account of the denial of all those money market facilities which the stock exchange affords.

We have no plan to offer for a resumption of regular dealings in securities, but we are persuaded that until the means for such dealings are restored, trade and industry will suffer for want of capital and credit. The stock exchange is the ultimate market for all American values. Without that market values are becoming more and more doubtful and in an atmosphere of doubt financial inclinations toward inaction become more and more pronounced. The happenings of the war and the circumstances of agriculture, commerce and manufacture, bearing on values, are without any means of reflection and with enormous amounts of capital locked up in securities, either through investments or loans thereon, and without any way to render funds liquid, bankers will not venture forth in loans which are indispensable to the prosecution of economic enterprise, old or new.

The large over-subscription for the New York City loan at the public offering was a satisfactory token of investment conditions conducive to a revival of dealings in securities if a way can be found to deal with the tremendous obstacle presented by the certainty of a heavy European liquidation here. In the foreign ex-

change market sterling bills have been distinctly firm, but it is believed that more workable levels must be established by the provision of gold exports made in the New York City loan operation and the further provision guaranteed by the $100,000,000 gold pool which the banking community of the country as a whole is raising.

Apropos the more strictly financial aspects of the situation there is matter for congratulating the country in the manifesto issued by Secretary McAdoo on the subject of the hoarding propensities of what are called the interior banks. It is not at all desirable that reserve money should be put into circulation at a time like this, but it is altogether undesirable that the conservation of reserve money should become an excuse for refusing the grant of credit which would increase bank deposits and automatically effect a reduction in reserve ratios. Contrary to a mistaken popular notion the emergency situation is not in its financial aspects one that calls for relief through a vast output of currency. The real banking relief for economic crises, however induced, comes through the extension of credit. If Mr. McAdoo's proclamation will move bankers to become freer lenders without making rates easy, the circumstances of general business will be vastly improved.

One of the delusions of the day which is being dissipated by the revelations of the war is that we have an immediate profitable foreign trade opportunity. Students of international trade know that the great volumes which it has attained in recent years have resulted chiefly from the provision of capital to those countries through the purchase of securities representing new enterprises for the exploitation of wealth creating resources. This provision has had the support of a very liberal indulgence of credit to the commerce of new countries, and it is now being perceived that the extent to which the war has presented the United States with a foreign trade opportunity is measured, for the most part, by America ability to supply both capital and credit to foreign markets which have been deprived of them by the plunge of all Europe into the abyss of war. The great trading nations of Europe have been the great capital and credit purveying nations of the world. The international trade which the war has cut off is not something which has been relinquished by Europe and only waiting for us to take.

Our foreign trade opportunity consists largely in the fact that Europe has been forced to withdraw from markets in which it has been making trade. If we are to expand our international commerce, we must in the main do it by going out and creating trade for ourselves.

PLANS OF THE NEW YORK COTTON EXCHANGE FOR A NEW CONTRACT IN CONFORMITY WITH THE LEVER ACT

SINCE the passage of the United States Cotton Futures Act (Lever Act) on August 18, the Board of Managers of the New York Cotton Exchange, through a Special Committee, has been at work formulating a new form of contract in terms consistent with the requirements of the new law. The confusion resulting from the European War and the closing of all the cotton exchanges in the world has not interfered with the prosecution of this work. Indeed, the interruption to the regular business of the New York Cotton Exchange has seemed to give an opportunity for the introduction of the new contract at once upon the re-opening of the Exchange. The special committee having the matter in hand has now got far enough along to make a report to the Board of Managers with regard to the essential points that must be embodied in the new contract; and such a report was submitted on Thursday of this week. It is as follows:

* * *

To the Board of Managers of the New York Cotton Exchange.

Gentlemen:—In view of the operation of the "United States Cotton Futures Act," effective February 18, 1915, your Committee begs leave to suggest the immediate adoption of a new contract which shall conform as closely as possible with the terms of that Law, to be traded in up to and including February 17, 1915, and thereafter, except that the contract will be subject to such changes as will be necessary through the promulgation of rules and regulations which the Secretary of Agriculture is authorized to make.

In view of the near approach of the time when this Act becomes effective (February 18, 1915), we are of the opinion that new rules and by-laws should be effective on the day the Exchange re-opens, and that trading in existing contracts should be confined to liquidation.

The Secretary of Agriculture is authorized by the law to make new standards of Cotton prior to February 18, and thereafter on one year's notice to the trade. The standards which will be effective on February 18, will probably not be promulgated for some time to come. As it is practically certain that no changes will be made in the present standards excepting on the lower grades, we recommend that the new contract be based on the Government Standard as it now exists, and that such standard shall be in effect up to and including February 17, 1915, and that thereafter the standard shall be the official standard of the United States which is effective on any date of delivery. The changes that will probably be made in the lower grades will be correspondingly reflected in grade differences as established, and there should therefore be no change in the value of the contract provided that (as we feel certain will be the case) there is no change in the Middling Box.

Our present provision for Grade differences to be made by the Revision Committee is adequate until the law becomes operative, when, as it would appear, differences to be promulgated by the Secretary of Agriculture will automatically be substituted. We recommend, however, that Section 27 be so amended as to provide for the appointment by the Board of Managers of a Revision Committee whose duty it shall be, in case the Secretary simply designates five spot markets (the average of whose differences must be used) to arrive at and establish daily such differences, and who shall also be authorized to make daily differences in the event that the machinery provided by law should for any reason become inoperative.

The matter that has given your Committee the most concern, and which is of vital importance to the cotton trade, is the right of appeal on class and/or staple to the Secretary of Agriculture. In view of this clause of the law, we are unanimously of the opinion that guarantee of class and/or staple by the Inspection Fund is absolutely impossible, on and after February 18, 1915.

Under this condition, where a statute is now substituted for well defined customs of the Cotton Trade, we are of the opinion that our only practical course is to continue our Inspection Department as at present, with a Super-Board of Appeals, who shall have power to supervise at all times the work of the Classification Committee; the Inspection Bureau to continue issuing certificates of grade and such certificates to remain in force as to grade and staple as long as cotton is in store. We are aware, of course, that this certificate without guarantee is not of the same value to a receiver, and that the absence of this guarantee would no doubt result in an increased discount on nearby deliveries as compared with distant. But discounts in excess of actual carrying charges would undoubtedly be avoided if (as has been suggested by this Committee to the Department of Agriculture) the Government should have stationed at this City, officers or agents of the Department of Agriculture to whom appeals could be promptly made and thus all certificated cotton would carry the Department's approval. It is the opinion of this Committee that the Department of Agriculture will see the wisdom of pursuing this course.

Your Committee has been shown every courtesy and consideration by the Department of Agriculture and has had the pleasure and benefit of personal interviews with the Secretary himself and members of his staff. Your Committee believes the Department earnestly wishes to provide rulings and regulations which will prove to be for the best interests of the trade. Your Committee is of the opinion that the expression of our views as merchants will be reflected in such rulings by the Department as will permit the operation of sound and business-like methods in full compliance with both the spirit and intent of the United States Cotton Futures Act.

Your Committee deeply regrets that we are unable to secure from the Secretary of Agriculture as promptly as we had hoped and endeavored to obtain, such rules and regulations as he is authorized by law to make, and which are necessary to permit the framing of a more definite contract. However, we believe that the exigencies of the present situation compel us to proceed along the lines suggested.

In order to meet the provisions of the new law, we recommend that all proforma bills be abolished and that the exact language of the law on this subject be incorporated in our By-Laws and Rules.

On and after February 18, 1915, appeals to the Department of Agriculture may be made on cotton which has been classed by the Classification Committee, but notices of appeal on such cotton should be filed with the Superintendent of the Exchange within five business days after the issuance of grade certificates by the Inspection Bureau.

The new law requires the issuance of a five day notice before delivery of cotton. We have called to the attention of the Department of Agriculture the necessity for the issuance of a one day notice at the end of a month. Should such provision not be made by the Department of Agriculture, trading in the current month must cease in time to permit the issuance of notices as provided by law. Respectfully submitted,

ROBERT C. CAIRNS, Chairman,
S. T. HUBBARD,
BRUCE L. RICE,
ARCHIBALD B. GWATHMEY, JR.,
EDWARD K. CONE,
Special Committee.

THE CONTRACT MARKETS

THE NEW YORK COTTON EXCHANGE.

The following were the high, low and closing bid prices for each delivery, on Friday, July 31, in cents and hundredths of a cent per pound, gross weight:

	July 31.	Mon.	Tues.	Wed.	Thurs.	Fri.

The MOVEMENT OF THE AMERICAN CROP.

The American crop year has been changed to run from August 1 to July 31, and all comparisons are made up accordingly.

The following tables, derived from the New York Cotton Exchange, show the movement of the American cotton crop for the past week and since August 1, 1914, with comparisons for previous years:

CROP MOVEMENT INTO SIGHT.

Weekly Movement.	1911-12.	1912-13.	1913-14.	1914-15.
Port receipts	438,629	379,865	370,055	99,287
Overland to mills and Canada	6,187	2,673	5,018	2,479
So. mill takings, est., exclusive of takings from Southern ports.	65,000	65,000	65,000	30,000
Gain of stocks at interior town	41,954	35,694	25,420	49,345
Brought into sight for week	551,770	483,232	465,493	181,111
Total Movement—				
Port receipts	1,472,099	1,200,697	1,327,566	290,042
Overland to mills and Canada	18,998	17,172	30,501	8,401
Southern mill takings..	242,032	215,873	254,796	78,000
Stocks at interior towns in excess of Sept. 1..	146,186	111,941	63,069	117,357
Brought into sight thus far this season	1,879,315	1,545,683	1,675,932	493,800

The total crop movement is respectively for 60 days, 58 days, 57 days and 56 days.

Cotton Production in Peru.—Consul General W. W. Handley, of Callao, in writing of the commercial and industrial progress in Peru, says that the cotton industry of the country received an impetus during 1913 from higher prices for the staple and increased production, which offset to some degree the results of the poor crop and low prices of rubber and sugar. The ruling price in January for the semi-rough cotton of the country opened at 7.30d. (14.6 cents) a pound, declined to 6.64d. (13.28 cents) in August, and closed at 7d. (14 cents) in December. Fair and soft "Egypto" cotton was quoted at 7.5d. (15 cents) a pound in January, reached the high price of 8.4d. (16.8 cents) in September, and closed at 7.5d. (15 cents) in December. The prices received for both the foregoing qualities were considerably higher than in 1912.

Peruvian cotton to the value of $1,224,508 was exported to the United States during the year 1913, which is an increase of about 33 per cent over the preceding year. No official statistics are available giving the year's exports of cotton to all countries, but they have been estimated at $5,500,000.

The total production of cotton in Peru for the last five years

was: 1909, 38,017,650 pounds; 1910, 33,029,105 pounds; in 1911, 38,389,535 pounds; 1912, 37,656,130 pounds; 1913, 52,344,640 pounds. This increase of more than 14,300,000 pounds for the five years ending 1913 is largely accounted for by the low price of sugar and the bull cotton market. A number of sugar estates in Peru have been planting a fair quantity of cotton, and in addition large areas hitherto devoted to other products or merely waste lands are being converted into cotton fields, because of the profits paid by this crop under present conditions. Not only is the quantity of cotton increasing but its quality is improving as well, owing to the wider use of modern machinery in handling the product. The prices quoted on the Liverpool market determine the price of Peruvian cotton, as there is practically no market in Lima.

* * *

The Production of Kapok, or Tree Cotton, in Ceylon.—Recent inquiries from the United States and Europe, particularly from Germany, writes Consul Charles K. Moser, of Colombo, seem to indicate that a considerable commercial interest has developed in the production and uses of kapok. The kapok is a tropical tree, found largely in both the East and West Indies. Another species, not so tall, is found in Mexico. In the East Indies the tree is more largely cultivated as a crop in Java and in the Philippines. Under American rule in the Philippine Islands the cultivation of kapok has been scientifically studied and developed to a certain extent along modern agricultural lines; but in Java, from which place considerable quantities are exported to Europe, kapok is cultivated only as a secondary crop, and the methods employed in its production are primitive. [Kapok cultivation in the Philippines was discussed in THE MARKET WORLD AND CHRONICLE, Vol. VII, page 797.]

In Ceylon kapok could hardly be described as a seriously cultivated crop at all, though it is one of the easily grown products of the island. It is generally planted along the roadside and around the boundaries of gardens as a sort of extra crop from what would otherwise be waste land. About the environs of Colombo the tree is largely grown as a border tree for canals and earthworks, where erosion might otherwise destroy the banks. It has a wide distribution, however, over the low country and up to an altitude of 2,000 feet.

The kapok is a fairly tall, gaunt, deciduous tree with a straight trunk, and its many branches jutting out in groups of three at right angles to the bole make it easily recognizable. The peculiar odor of its flowers has a strong attraction for fruit bats, and consequently flowers are destroyed by thousands which would otherwise produce pods of the silky floss or kapok of commerce. One of the drawbacks against attempting to cultivate the tree in Ceylon with

(Continued on Next Page.)

NEW YORK QUOTATIONS FOR STANDARD COTTON GOODS AND YARNS

The following are quoted prices in the New York market for typical standard cotton goods (in cents per yard) and cotton yarns (in cents per pound) on Saturday of last week and on Wednesday of the present week:

Cloths.	Saturday.	Wednesday.
Print cloths, 28 in. 64 x 64s	3⅜	3⅜
Gray goods, 38 in., standard	4¼	4¼
Brown sheetings, Southern standard	7½	7½
Denims, 9-ounce	13½-17	13½-17
Tickings, 8-ounce	13	13
Standard prints	5¼	5¼
Standard staple ginghams	6¼	6¼
Yarns.		
Southern 2-ply skeins, 30s	20-20½	20½-21
Southern 2-ply skeins, 60s	43-44	43-44
Southern single skeins, 20s	17½-18	18
Southern single chain warps, 20s	17½-18	18
Southern 2-ply chain warps, 20s	18½-19	18½-19
Southern frame cones, 20s	17¾	18-18½
Southern frame cones, 30s	20½-21	21-22
Eastern carded cops, 20s	20¾	20¾
Eastern carded cops, 30s	24¼	24¼
Eastern carded peeler warps, 30s	27	27
Eastern carded peeler warps, 50s	44	44

the expectation of any large remuneration is the presence of these destructive bats in immense numbers.

The principal obstacles so far encountered in its cultivation, however, are the cost of labor, as compared with the price paid for the product, and the difficulty of gathering the crop. Most of the pods containing the floss grow on the end of the branches, and it is not easy to induce the coolie laborer to take the risk among these slender branches at a considerable height from the ground. The use of stepladders as a means of gathering crops has never been introduced in Ceylon, and it is hardly probable that for such a crop as kapok alone they could be employed with advantage. Moreover, the business of gathering the ripened pods is a rather slow one, as only the most careful and experienced coolies can tell when they are ready for harvesting. Before ripening the kapok pods are of a light-green color and smooth, but at the right time they become wrinkled and brownish. If left even for a few days longer the floss often loses its luster and soft quality and is of little value.

Most of the kapok now being exported from Ceylon comes from the Matale district, to the north of Kandy. In this district the tree does not grow so tall and, with low outstanding branches, is more like a shrub; it is therefore easier to gather the pods. The pods are picked by hand and cured by being allowed to dry thoroughly in thatched sheds on the estate or in the homes of the villagers. They are then broken and the "cotton," or floss, is roughly hand-cleaned by coolie women. It is then packed in bales and sent to Colombo, where the seeds are removed by special machines made in Germany.

The exports from Ceylon to the various countries for 1912 and 1913 were as follows:

	1912		1913	
Exported to	Pounds.	Value.	Pounds.	Value.
British India	272,049	$10,092	92,239	$3,686
United Kingdom	125,507	11,719	14,645	1,085
Maldives	.....	.....	5,992	410
Natal	.....	.....	400	78
Belgium	83,204	10,314	25,941	2,478
Germany	29,676	4,077	82,994	7,974
Netherlands	53,186	6,986	7,247	628
Italy	.....	.....	8,285	816
All others	8,452	1,292	1,372	54
Totals	572,074	$44,480	239,115	$17,203

It will thus be seen that the United States is not now a buyer of Ceylon kapok and the records of this office show that very few shipments have ever been sent to American ports direct. It has been declared that the production of kapok in Ceylon will never be found profitable for European planters. At present (June, 1914) Colombo firms can purchase from the villagers a fair quality of amber-colored, well-cleaned floss, free from seed, at $10 per hundredweight of 112 pounds, delivered in Colombo. The uncleaned floss, i. e., with only the outer husk removed, of good quality and dried, can be purchased at $3 per hundredweight delivered. There is also a market for the seed at $0.73 per hundredweight.

The usual weight of bales for export is 168 pounds, and the present market price is $15 per 112 pounds net, c. i. f. Boston, New York or Philadelphia. Exporters state that they are prepared to sell to American firms c. i. f. New York, payment against letter of credit, 90 days' sight draft, with documents attached for full invoice value, to be drawn on London or New York.

[A sample of fair quality Ceylon kapok will be loaned, upon application, by the Bureau of Foreign and Domestic Commerce, and its branch offices, from which may also be obtained the names of four Colombo firms interested in this fiber.]

Sea-Borne Trade of India for Fiscal Year.—The returns of the sea-borne trade of India for the twelve months ended March 31, 1914, show an increase of £16,428,214 in imports of merchandise, according to the "Australasian Insurance and Banking Record," and an increase of £1,985,517 in exports of merchandise as compared with the preceding twelve months. A comparison for the last three financial years is as follows:

Imports.	1911-12.	1912-13.	1913-14.
Merchandise	£96,036,959	£111,086,454	£127,514,668
Treasure	35,647,232	41,221,169	28,959,767
Totals	£131,684,191	£152,307,623	£156,474,435
Exports.			
Merchandise	£151,993,204	£164,145,556	£166,131,073
Treasure	6,915,938	7,087,843	4,721,923
Totals	£158,909,142	£171,233,399	£170,852,996

The alteration in the balance between imports and exports of merchandise has been largely balanced by the diminished imports of treasure. For the new financial year the reduced wheat crop appears likely to lead to an inelastic condition of export trade. The separate particulars of the gold and silver imports, included under the heading of treasure are not available for the financial year to March 31. But for the past two calendar years a comparison of gold movements is as follows:

Imports.	1912.	1913.
Sovereigns and other British gold coins	£22,339,731	£11,174,968
Bullion	9,466,711	10,965,627
Other coined gold	174,382	193,808
	£31,980,824	£22,334,403
Exports.		
Sovereigns, etc.	£2,047,115	£1,401,656
Bullion	2,322,328	2,284,403
Other coined gold	24,102	32,043
	£4,393,545	£3,718,108

Net imports of gold into India during 1913 were thus £18,616,295, against £27,587,279 for 1912, or a decrease of £8,970,984. The net imports (after deducting exports) of silver into India during 1913, amounted to £9,567,590, against £9,352,419 for 1912.

Things and actions are what they are, and the consequences of them will be what they will be; why then should we desire to be deceived?—Bishop Butler's Sermons at the Rolls.

IT is, we think, no exaggeration to say that up to two months ago American bankers, as a class, were ignorant of the very meaning of the words "intrinsic value," and did all their thinking in terms of "market value." The price obtainable for a security or a commodity, if immediately sold in the market, was the basis upon which they made collateral loans upon such security or commodity; and in estimating the credit to which an individual or a corporation was entitled they consciously or unconsciously took into account the presumed present worth in the market of the securities or property owned by the individual or corporation. In the larger financial centres, where stock exchanges and commodity exchanges are found, our bankers went even further than this, and assumed that for their purposes but one value need be taken into account, and that the quoted prices made upon these exchanges. Too often it was a matter of indifference to them what the intrinsic value of this or that security might be or whether the quoted price of a commodity in a single market, commonly followed by them, was reasonably consonant with its intrinsic value, judged by the criteria of the world's use of it, on the one hand, and of the cost of producing it in sufficient quantity to meet that use, on the other hand. Being busy men, they deemed their duty done if they kept track of the quotations registered on the ticker tape, and held borrowers to the quick adjustment of their collateral to these quotations. A security might be selling in the market at a price dictated by the hopes and desires and market operations of those interested in it or by the fears of those having commitments in it, and with but slight regard to the elements of true value in the property represented by it; yet the market quotations were very generally taken by bankers as having such finality that the safeguarding both of loans and of the legitimate interests of borrowers should be made to rest upon the basis of these quotations. A purely technical situation might exist in a commodity market,—as of dealers compelled to fulfill contracts they had made, at any price exacted of them,—and as a result the quoted prices in that market might be out of all relation to the intrinsic value of the commodity itself; yet bankers judged of the soundness of their loans upon the commodity by the prices reported in that market. In short, the obsession that securities and commodities can have no value except that measured by prices immediately obtainable for them in markets generally normal, but like all other human things, subject for brief periods to disturbing influences, whether internal and technical or completely external to themselves, had become so deeply ingrained in the thought of bankers that it is not extreme to say that in abnormal and difficult times the actions of bankers themselves, in supposed protection of their interests, were only to apt to add to, rather than alleviate, the confusion and distress. It is true, and ought to be said, that when the general trouble had reached such acuteness that the very failure of industry and finance was endangered, certain exceptionally courageous and resolute bankers were always found to intervene and, by their defiance of market quotations and insistence on the intrinsic value of properties and commodities, stay the disaster. But with this the generality of bankers had little to do; they simply fell in behind leaders who seemed to them to be doing extremely hazardous things, yet whom they felt compelled to obey.

Two months ago the sudden and to most business men totally unforeseen outbreak of the greatest war in history at one stroke destroyed, at least for the time being, the whole machinery of security and commodity markets, stopped instanter the quotation of prices upon them, and deprived bankers of the mechanical support of these prices in the conduct of their business. Not merely did the quoted prices stop, but the markets themselves stopped and no other took their place. Despite some desultory buying and selling on the stock exchanges and bourses at home and abroad, it is substantially accurate to say that there is no immediate market for securities anywhere in the world to-day. The same is true of all the commodities except foodstuffs. Cotton exchanges, coffee exchanges, sugar exchanges, metal exchanges, and all other commodity exchanges are closed from one end of the earth to the other. Hence no banker can say what the market price of either securities or commodities (except foodstuffs) really is. He may hear of prices made here and there in dealings between individuals; but he cannot say that these prices are really representative of a true market, in the modern sense of the word.

Yet the bankers of the United States are to-day carrying thousands of millions of dollars of loans with securities and commodities as collateral against them. The cataclysm caught them with these loans on their books and they had

no opportunity to apply the traditional rule that the market price of the collateral is governing in respect of the continuance of a loan. Markets for the sale of the collateral there have been and are none. And the result is that the bankers have been brought by *force majeure* to take intrinsic value, instead of temporary market value, in practice if not in theory, as the basis of their business. Most of them, of course, would refuse to admit this, even to themselves; but there can be no doubt that it is so. Everybody recognizes it in his practical dealing with the present situation of our banks. The Comptroller of the Currency and his bank examiners recognize it in respect of the National banks; the State banking departments and superintendents of banks recognize it in respect of State banks, trust companies and savings banks. Indeed, the principle is carried even farther and is applied to the thousands of millions of investments of our insurance companies of every kind.

It is probable that if such a state of things as now actually exists had been described six months ago to the average American bankers as possible and probable, he would have had, not the slightest hesitation in predicting that, the moment this came about, the country would be plunged into the most disastrous panic it had ever known and that the industry and commerce of the country would be absolutely paralyzed. And yet no such result has ensued from the reality of the incredible change. On the contrary, our banks are going on about their customary business, and with ever increasing freedom and courage. We venture to say that the sleepless nights of our bankers are for the most part all in the past. As they have forced themselves to look at their situation without traditional and inbred fears and anxieties, they have found that where they are sure of the intrinsic value of the securities or commodities pledged with them, they can await without serious apprehension the restoration of the temporary disabled machinery of finance and commerce, confident that market prices will in the long run reflect this intrinsic value, rather than the external uncertainties of the times or the necessitous selling after all of a relatively small number of individuals, whose position, when the great blow fell, was not such as to enable them to withstand its effects.

It is our opinion that very great good will result to the country, if the present experience of our bankers and the economic lesson it conveys are remembered and taken to heart. We want our bankers as valuable to us as we can have them; we want them to be wise and prudent, yet at the same time indomitably courageous, in the handling of the immense interests we entrust to them. As a class, they are peculiarly the leaders of our society in an economic sense, at the same time that they are its most valuable servants. It is all-important to us that they should not be thinking in terms which are in the largest way economically unsound. We cannot afford to have them followers of rules-of-thumb, unthinking acceptors of unreal criteria in the conduct of their business, rather than men capable, whenever the times are out of joint, of going straight to the realities, and using these as the basis of whatever they do. What we ask of them is that they should truly safeguard the genuine interests of the community, rather than show themselves optimistic and generous of credit when the wind blows fair, fearsome and unregardful of the welfare of those who deal with them and rely upon them, when the storm breaks. And we think that it is impossible for any banker to think justly and to act courageously, when his entire conception of the value of what he allows credit upon, is the market price it will fetch if instantaneously sold out. When all is normal and the machinery of markets is in usual operation, to be sure, this is no bad test of the worth of collateral; but we have again and again in the past seen markets disarranged and violently moved by influences of an obviously temporary kind, while now for the first time in a century we see markets completely destroyed for the time being. Yet somehow we must go on with our business; we cannot stop and idly watch multiplying distress on all sides of us. When such a juncture comes about, it is the duty of bankers resolutely to fall back upon reasoned knowledge of the permanent and intrinsic worth of the things whose value they must assess for the general good.

We are well aware that to all but a few bankers what has been said above will appear entirely visionary and, indeed, of the most dangerous import. Until the present stoppage of the customary machinery of industry, commerce and credit, we are confident that not one banker among those generally looked upon as authorities would have had anything but derisive words to apply to it. And yet, at this moment, virtually every banker in the land who is more than a local money-lender is doing in practice what is here set forth in theory. The trouble is, however, that with a few exceptions the bankers are not doing it widely enough and courageously enough. In respect of their present commitments they are accepting the inevitable and are finding out that no harm is coming to them, while great good is coming to the country as a whole, in consequence. But they are averse to permitting new commitments upon any such basis. They do not wish to become involved, for instance, in any plan to assist the producers of cotton over the difficulties occasioned by a temporary tie-up of their product. They say to these producers, in effect, that for them the hard law of supply and demand, not as a law really operating over months and years, but as one producing destructive effects for a brief period, must govern. They are unwilling to admit that the known character of an industrial property may give to the securities representing it an intrinsic worth in their eyes, irrespective of the momentary price at which those securities could be sold, while at the same time they take the position that a necessity of life like cotton, whose cost of production and whose average market value to the world are easily ascertainable, must be assumed to be worth only what it will bring at forced sale at a time when the outlets for it are choked up and the real demand for it cannot become effective. Yet in truth this is what the bankers are really declaring when they put cotton outside the category of collateral upon which it is not only advantageous but safe to make advances proportionate to its ascertained value to the world over a long period of years just past.

It cannot be expected, of course, that knowledge will come in its fullness in a day. It will be long before bankers in general will realize that it is their first duty, in times perilous to the economic welfare of the community, to fall back upon intrinsic value, in place of market price, as the rock upon which they can safely and confidently rest. These present times, however, with all their distresses, will not have been a pure loss to us, if the thinking of our bankers is through them more and more turned in this direction.

Arthur Richmond Marsh

TWO CURRENT MISCONCEPTIONS AS TO THE FOREIGN TRADE OF THE UNITED STATES

By J. J. Slechta
General Agent of the Lloyd Brazileiro, Formerly of the United States Consular Service

So much publicity has of late been given to the question of increasing our foreign trade, in view of the supposedly increased opportunities expected to result from the European War, that it would seem desirable to define with some degree of accuracy the actual position of the United States with relation to other great producers of manufactures and other goods for export. Constant reference is made to the fact that the United States has only a relatively small share of the import trade of non-European countries. For example, it is trite to repeat that of the large import trade of South American countries, the United States obtains only about 15 per cent, as compared with a somewhat larger proportion obtained by each of our largest competitors, England and Germany.

An academic discussion of reasons why we should increase our export trade is in reality beside the question. The vital point at issue is simply this: Is it plausible to suppose that the United States, in view of the world's market prices in relation to those of the United States, can actually succeed in acquiring a larger proportion of the world's foreign trade? The word "proportion" is used advisedly. That our exports will increase, is not open to question, but that they will grow in a greater ratio, relative to the present total, than those of our chief European competitors is not only doubtful but highly improbable. The basis of this conclusion may be stated briefly as follows:

A comprehensive familiarity with the industrial position of the respective countries bidding for the world's trade and of market values of the products exported from each will at once incline any open-minded student of the question to the conviction that while the United States produces for the domestic trade, and markets its surplus abroad if it finds it advantageous to do so, our European competitors produce primarily for the foreign trade. Basing its estimate on the last census, the Bureau of Manufactures calculates the total output of manufactured goods in the United States as closely approaching twenty-five billions of dollars, or rather more than the total of such products produced in England, Germany, France, Belgium and Holland, combined. Relating these respective totals with the totals of exports of manufactured and partly manufactured goods, it is significant that, while the United States ships to foreign markets a total equal to 4½ per cent of our production, the five countries mentioned ship abroad a total of manufactured goods equal to more than 60 per cent of their production. This should readily convince one that Europe needs her foreign trade very much more than this country needs it and, therefore, will work proportionately harder to hold what she has and to get more. So much for a comparison on the basis of nations as a whole. The comparison as regards the per capita export trade is even more striking. The per capita exports of the United States reached their highest point in 1913, when they were about $25. Those of Holland were $210; Belgium, $100; United Kingdom, $53; Germany, $33; and France, $32. These statistics, taken in conjunction with the fact that the total production of the respective countries is so much less than that of the United States, at once throws additional emphasis upon the logical conclusion that export trade is a matter of life and death to the European countries and only an incident in the total commerce of the United States.

Attention is frequently called to the tremendous increase in our export trade, but as a matter of fact this has only kept pace with our total production. In the twenty years from 1893 to 1913, production of manufactured goods increased about 160 per cent, while the total of our exports, including raw products and foodstuffs, increased 140 per cent in the twenty-one year period from 1892 to 1913, and the total exports of manufactures alone increased 650 per cent in the same period. In view of the situation of other nations, our competitors, it would seem that we could hardly expect to increase exports of manufactures any faster, and yet we have barely held our own with the competing countries referred to. Lest a wrong construction be placed upon this phenomenal increase, it must be borne in mind that by far the greater part of the increased export of manufactures has been absorbed in the very countries which we regard as our trade rivals, and should for that reason be largely disregarded, inasmuch as it represents the value of products not generally sold in competition with European countries in non-European markets.

Bearing the above analysis of the world's foreign trade in mind, it is readily seen how futile it is for this country to hope for any material increase of foreign trade as a result of the European War. Bearing in mind, too, the fact that the relative supremacy of the European manufacturing countries, and the comparatively smaller domestic consumption, has made them lending and not borrowing nations, it must be apparent that any disaster to the economic welfare of those countries must also be highly disastrous to the countries with which they have had such close commercial relations. War has shut off a large part of the supplies of foods and manufactured goods purchased by South America, Africa and the Far East, and it has no less shut off the exports of goods from these latter divisions of the world to Europe, and has thereby greatly reduced the purchasing capacity of Europe's customers. The United States, as the greatest borrowing nation in the world, obviously and necessarily has no capital to take the place of the vast streams of gold which Europe has been wont to send to all parts of the world, and which it is now rapaciously consuming with fire and sword.

As for the effect of means of transportation upon the possible increase of our foreign trade, the writer is convinced that it is a largely negligible factor. The following figures tell the whole story of the fallacy as to a possible lack of ocean carriers for any existing business.

During the latter half of 1912, the normal chartering rate which owners of tramp cargo steamers received for business in safe trades was from 7s. to 7s. 6d. per ton per month of the deadweight cargo capacity of the vessel, on voyages of from two to four months. From that time on, up to the period immediately preceding the present European trouble, the rates have steadily decreased, and during June and July owners were offering tonnage in the same kind of trade at from 3s. 6d. to 3s. 10d. per deadweight ton, thus representing a decline in the earning capacity of cargo tonnage of rather more than one-half. Let it be borne in mind that with rates at this figure, much British and some other tonnage is withdrawn from trade, owners preferring to tie up their vessels, in order to avoid operating expenses, for which they are not compensated at such low charter rates.

After the opening of hostilities, all German tramps were immediately swept from the seas, while upon British, French and Belgian tonnage there was placed a handicap of heavy war risk insurance. This has left a comparatively small amount of neutral tonnage available, mostly of Scandinavian, Dutch and Greek vessels. What is the result as to charter rates? Since August 15 this neutral tonnage has been available to charterers in such trades as that above described at from 3s. 9d. to a maximum of 4s. 3d.,

which was the rate generally quoted during the third week in September. British tonnage is available at rates just sufficiently below these rates to make up for the extra burden placed upon cargo shipped in its bottoms by the war risk insurance. American cargo vessels of a similar type cannot be operated, even with the recent modifications in the laws applicable to crews and officers, at less than 4s. 6d. per ton if the owner is to avoid a loss.

The reader may judge for himself as to the actual demand for tonnage which can only be met by the extraordinary expedient of a Government owned merchant marine. If the Administration will dispassionately face the facts, it must readily disabuse the minds of its misguided advisers as to the necessity of so absurd an undertaking, and as to the possibility of in any way serving the people by resort to so fantastic an enterprise. It is a fallacy to suppose that trade follows the flag. This country already has a normal foreign trade of over four billion dollars annually, which is all we are entitled to under the circumstance of the world's markets. Little Belgium, without a merchant marine of any importance and with a territory less than that of the State of Maryland, has a foreign trade equal to more than a third of the United States total imports and exports. Holland, with about the same area as Belgium has a foreign trade three-fifths as great as that of the United States. She has a merchant marine of some importance, but her trade is developed by reason of industrial supremacy and not maritime strength. Norway, with a merchant marine three times as great as that of Holland, has no foreign trade worth mentioning. Whatever we produce and sell more cheaply than another country, we can readily find a market for, regardless of the nationality of the carrier upon which we must rely to deliver it.

THE DESTRUCTION OF CAPITAL IN THE EUROPEAN WAR

CONSIDERABLE interest having been manifested in a line of thought suggested by us editorially in the THE MARKET WORLD AND CHRONICLE of Aug. 1, it has seemed worth while to pursue the subject somewhat further. We refer to the statement that the permanent destruction of the world's financial system will not result from the European War, and that the recovery of the principal nations involved will be rapid after the conclusion of peace. We supported this statement by a quotation from John Stuart Mill's "Principles of Political Economy," which was as follows:

"This perpetual consumption and reproduction of capital affords the explanation of what has so often excited wonder, the great rapidity with which countries recover from a state of devastation; the disappearance, in a short time, of all traces of the mischiefs done by earthquakes, floods, hurricanes, and the ravages of war. An enemy lays waste a country by fire and sword, and destroys or carries away nearly all the movable wealth existing in it; all the inhabitants are ruined, and yet in a few years after, everything is much as it was before. This *vis medicatrix naturae* has been a subject of sterile astonishment, or has been cited to exemplify the wonderful strength of the principle of saving, which can repair such enormous loses in so brief an interval. There is nothing at all wonderful in the matter. What the enemy have destroyed, would have been destroyed in a little time by the inhabitants themselves; the wealth which they so rapidly reproduce, would have needed to be reproduced and would have been reproduced in any case, and probably in as short a time. Nothing is changed, except that during the reproduction they have not now the advantage of consuming what had been produced previously. The possibility of a rapid repair of their disaster, mainly depends on whether the country has been depopulated. If its chief population have not been extirpated at the time, and are not starved afterwards; then, with the same skill and knowledge which they had before, with their land and its permanent improvements undestroyed, and the more durable buildings probably unimpaired, or only partially injured, they have nearly all the requisites for their former amount of production. If there is as much of food left to them, or of valuables to buy food, as enables them by any amount of privation to remain alive and in working condition, they will in a short time have raised as great a produce, and acquired collectively as great wealth and as great a capital, as before, by the mere continuance of that ordinary amount of exertion which they are accustomed to employ in their occupations. Nor does this evince strength in the principle of saving, in the popular sense of the term, since what takes place is not intentional abstinence, but involuntary privation."

This statement runs sharply counter to the almost universal tendency on the part of financial writers in this country and abroad to take a gloomy view of the permanently destructive effects of this war upon the European financial system. A representative opinion of this sort may be quoted from the London "Statist" of August 1:

"If the war were carried on with such determination and such rancor that it was protracted through three campaigns the waste of wealth in Europe would be inconceivably great, and when peace at last was concluded there would not be the means of immediately resuming the position which had been abandoned for the sake of slaughtering the peoples of neighboring countries. It seems safe to conclude, therefore, that in the present condition of Europe unless a war can be very quickly finished, it will exhaust the combatants and immensely lessen the predominance of Europe in the other Continents of the world."

In view of this conflict of opinion, it will be well to attempt to apply the principle set forth by Mill to the actual figures, in order if possible to establish a slightly more cheerful view than the one not unnaturally taken by the majority of men in the face of so great a disaster.

In the first place it should be said that emphasis has been laid upon the destruction of capital which the war would bring about. It is quite clear that the current income of the nations involved will be seriously disturbed. Let us examine more closely the question of fundamental wealth. Fortunately, as to the capital value of the belligerent nations we have the benefit of some very interesting figures. Before giving these it will be well to consider the estimated total wealth of the United States. The United States Census Bureau has published a careful estimate covering the total value of all property in this country in the years 1900 and 1904. The estimate for 1900 is $88,517,306,775, and 1904, $107,104,192,410. The estimate for 1904 was itemized as follows (omitting odd thousands):

Real property and improvements	62,340,000,000
Live stock	4,074,000,000
Farm implements and machinery	845,000,000
Manufacturing machinery, tools and implements	3,300,000,000
Gold and silver coin and bullion	2,000,000,000
Railroads and their equipment	11.245,000,000
Street railways, shipping, water works, electric light and power systems, telephone and telegraph systems, canals	4,841,000,000
All other property—products of agriculture, manufactures and mines, merchandise, clothing, furniture and miscellaneous personal property	18,462,000,000

It would be fair to say that not more than 10 per cent of this total was made up of so-called "consumption goods." It appears to us to be the fact that the waste of war falls largely on these consumption goods, and comparatively little upon the vast permanent capital value of the nation, and that, as John Stuart Mill has

pointed out, "what the enemy have destroyed, would have been destroyed in a little time by the inhabitants themselves."

It is true that in the present war there has been considerable destruction of buildings. But it is possible that when the final account is made up it will be found that the losses in this direction were more severe from an artistic, and hence hardly estimable, than from a financial point of view. In the estimated daily loss from a European War of approximately $50,000,000 a day, worked out by Dr. Charles Richet, "Destruction of towns, etc.," is placed at $2,000,000. This estimate has been widely accepted as based upon careful study of the possibilities, though Judge Gary, of the United States Steel Corporation, in a recent speech placed the daily cost at over $80,000,000 a day. On the basis of Dr. Richet's figures the capital loss resulting from a year's fighting would be $730,000,000. It would seem probable that $1,000,000,000 would certainly cover, as far as money can cover, the property loss in a year of fighting.

Let us now see what proportion this bears to the national capitalization of certain European nations. We have on this point the figures of Sir George Paish, as published in "The Statist" of London:

TOTAL WEALTH AND ANNUAL INCOME.

	Wealth.	Income.
Great Britain	$85,000,000,000	$12,000,000,000
France	50,000,000,000	6,000,000,000
Germany	80,000,000,000	10,000,000,000

While we consider these figures to be the best now available, the subject is of sufficient importance to justify citation of other estimates. A correspondent of the New York "Times" on September 18, gives some interesting figures:

"On January 1, 1913," he states, "on the occasion of its fortieth anniversary, the Dresdner Bank of Berlin issued a brochure entitled 'The Economic Forces of Germany,' containing, according to the bank's announcement, 'facts and figures taken from authentic sources,' specially prepared by the statistical department. Under the caption of 'National Wealth,' the estimates for the three countries were compared as follows, the authorities in each case being given: Germany (by Ballod), 270 milliards of marks; United Kingdom (by Mulhall), from 260 to 300 milliards; France (by Leroy-Beaulieu), 170 milliards. Reduced to equivalents in United States currency, four marks to the dollar, the figures compare thus:

France	$42,500,000,000
United Kingdom (averaged)	70,000,000,000
Total allies	$112,500,000,000
Germany	67,500,000,000
Excess allies' wealth	$45,000,000,000

"A year later a brochure was published by the Germanistic Society of America, giving a translation of a complementary part of the larger work, 'Deutschlands Volkswohlstand 1888-1913,' issued at the time of the celebration held by Germans throughout the world to commemorate the reign of the present German Emperor. This complementary part was prepared by Dr. Karl Helfferich, director of the Deutsche Bank, and it embraced a thorough-going study of statistics relating to Germany's economic progress and prosperity. The author, after elaborate calculations, estimated the annual income of the German people at 45,000,000,000 marks. This was contrasted with estimates made several years ago by Leroy-Beaulieu of 25,000,000,000 francs (about 20,000,000,000 marks) as the income of the French people and by Chiozza Money of £1,710,000,000 for the English national income, or about 35,000,000,000 marks. Reduced to our currency the comparison follows:

France	$5,000,000,000
England	8,750,000,000
Total allies	$13,750,000,000
Germany	11,250,000,000
Excess allies' income	$2,500,000,000

"Dr. Helffrich estimated the national wealth of Germany at from 290 to 320 milliards of marks. He quoted Edmond Théry for the estimate of 287,000,000,000 francs (232,500,000,000 marks) for the national wealth of France and gave the English estimates as running from 230 to 260 milliards of marks. Averaging Germany's wealth as 300 milliards of marks and England's as 245 milliards, the figures, in dollars, would show:

France	$57,400,000,000
England	61,125,000,000
Total allies	$118,525,000,000
Germany	75,000,000,000
Excess allies' wealth	$43,525,000,000

"This excess, it will be seen, corresponds closely with the excess as shown from the national wealth estimates of the Dresdner Bank.

"Furthermore, the Dresdner Bank gave the gold circulation of the three nations as follows:

	Million Marks.	U. S. Currency.
France	3,890	$972,500,000
United Kingdom	2,370	592,500,000
Total allies	6,260	$1,565,000,000
Germany	4,300	1,075,000,000
Excess allies' gold	1,960	$490,000,000

"The latter table does not agree with the estimates made by the Director of the United States Mint in his last report showing the approximate stock of money of the world as of December 31, 1912. On that date the gold in banks, in public treasuries and in circulation for the three countries was given as follows:

France	$1,200,000,000
United Kingdom	730,900,000
Total allies	$1,930,900,000
Germany	863,400,000
Excess allies' gold	$1,067,500,000

"The Mint figures for Germany are based upon an estimate by Dr. Arnold, a director of the Reichsbank, of 3,000 million marks in German gold coin in the country at the close of 1910. The estimate for France is that of A. De Foville in 1909. Since the date of the mint estimates in the foregoing tables the Reichsbank has gained about $150,000,000 gold and the Bank of France $180,000,000, while the Bank of England lost $18,000,000, so that the relative gold strength of the three nations is probably little changed. But to the stock of gold of the United Kingdom we should add the stock of her colonies and possessions, estimated by our mint at $166,900,000 for Australia, $147,800,000 for Canada, $374,000,000 for India, $57,600,000 for South Africa and $4,900,000 for the Straits Settlements, or a total of $751,200,000. This would bring the gold stock of the allies up to $2,682,100,000 by the United States authorities, against $1,075,000,000 for Germany as estimated by the Dresdner Bank.

"In connection with this phase of the situation we must remember that England is now enjoying without competition of Continental buyers the entire gold output of South Africa, which, allowing for the decline in production which has occurred in the Rand mines for the last year and a half, should aggregate $180,000,000 a year. Even should France secure part of this output it would be in the pot of the allies and so count against Germany."

Figures are not available for the other belligerent nations. But even if we suppose, for example, that the entire estimated loss from destruction of towns in a year, $1,000,000,000, would fall upon France alone, it will at once be seen how small an effect it would

have upon her total wealth as a nation. To emphasize this point, let us imagine a specific case. Suppose there is a textile mill at Amiens, capitalized at 1,000,000 francs. The stock is selling at the rate of 160, and the concern as a whole is in a thriving condition. Then the war breaks out. The mill is closed. Its stock drops to a nominal figure with the approach of the German troops. The soldiers, however, find nothing tempting in the mill and it is left unmolested. The war comes to an end, and once more the operatives are seeking employment, and textiles are in at least as great demand as they were before the war. The mill owners can borrow enough money on the plant to begin operations. At once the mill realizes profits and the stock goes up. Now the question is, what capital loss has taken place? From a fair business standpoint the property is exactly as good as it was a year earlier. And we must, by applying this same line of thought to the bulk of the capital goods of the belligerent nations, arrive at the conclusion that they will not be permanently or seriously depleted as a result of the European War.

THE PROPOSAL TO ESTABLISH A FREE PORT IN THE PORT OF NEW YORK

IN a recent memorandum to President Wilson, the Commissioner of Immigration has declared himself as favoring the establishment of a Free Port within the Port of New York. In taking this stand the Commissioner is supporting the campaign instituted by the Merchants' Association of this city during the Winter of 1913, and now being vigorously pushed along lines reinforced by careful study of the conditions involved, both in this country and abroad.

There appears to us to be on doubt of the potential importance to the United States of the economic principles underlying this problem, and they are obviously of special interest at a time when the possibilities of increasing the foreign commerce of the United States are receiving more searching consideration than at any time within the present generation. We propose, therefore, to set forth the commercial theory underlying the Free Port, and its applicability to New York conditions.

A Free Port is a zone in which the world's commerce may enjoy substantially all the advantages of free trade in a protectionist country. It is an area officially set apart, within or near an important harbor, where goods otherwise dutiable are permitted to enter without payment of duty, there to be stored without the expense incident to bonded warehousing; where merchandise, partly manufactured, may be finished and exported; where raw materials can be manufactured into articles for export; or where articles, manufactured or otherwise, can be transferred into different packages or containers and reshipped to new destinations. For example, a firm in the free zone of New York might import Panama hats, supply them with hat bands, put them in a salable condition and ship them to London; or a cannery might import fruit, sugar and cans, put up canned fruit, and ship the finished product to England without involving the complicated drawback on all three component elements.

The principal existing example of the Free Port is at Hamburg. The development of the institution of that port is of historic interest. Hamburg was one of the members of the Hausa League of free towns which did so much to make possible a healthy commerce during the fourteenth century, when the heavy duties levied by the numberless small States and principalities greatly reduced the profits of merchants. In 1871 Hamburg joined the German Empire, but remained a Free Port. In 1888 it was deemed advisable by the Government to incorporate Hamburg in the Zollverein, or Customs Union, but the advantages of the Free Port seemd too great to be given up. As a result, the actual port and the warehouses connected with it, covering an area of nearly 2,700 acres, half land and half water, were not included in the Union. The Free Port establishment, comprising practically the entire harbor of Hamburg, was shut off from the mainland by canals and floating palisades at a cost of $30,000,000, of which the Imperial Government contributed one-third.

Under this system the trade of the port has flourished to a remarkable degree. The following figures from the Statistical Abstract of the United States show the trade of Hamburg compared with that of London for the years 1910 and 1913:

FOREIGN TRADE OF HAMBURG AND LONDON.

	Imports.	Exports.	Total.
1910.			
Hamburg	$872,629,975	$661,480,532	$1,534,110,327
London	1,110,828,205	643,014,124	1,753,842,329
1913.			
Hamburg	1,096,550,183	864,229,672	1,960,779,855
London	1,164,769,445	702,161,337	1,866,930,782

It will be observed that the total trade of Hamburg exceeded that of London in 1913, and it is well to remember that the two ports are competing on substantially equal terms; for London, while not a Free Port in the technical sense of the term, is essentially a Free Port because of the fact that Great Britain is a free trade country.

The German Port of Bremen is another example of the Free Port, although it has not been granted the privilege of manufacturing within the free zone. In both these ports the development of port tonnage has been very rapid. The number of ships cleared from Bremen increased with rapid strides. The substantial figure of 4,953,164 tons was reached in 1912. The record of Hamburg is, of course, far greater. The average annual number of ships cleared between 1871 and 1890 was 2,207,760. The number in 1912 was 13,837,076. The tonnage cleared from the Customs District of New York during the same year totalled 13,549,138, although New York is comparatively free from the keen competition which faced Hamburg in its successful fight for the largest foreign trade in Europe. In connection with tonnage figures it is well to bring out a vital point in the development of all ports, namely low docking charges, such as are possible only in free ports. In this connection we quote from the able pamphlet written by Mr. Philip B. Kennedy, of New York University, who made a special study of the Free Port problem in Europe at the request of the Merchants' Association of New York.

"What makes a cheap ocean route," says Mr. Kennedy, "is primarily cheap terminal expense. The Interstate Commerce Commission, in the case of Western Traffic Association v. The Atchison, Topeka and Santa Fe Railway, 24 I. C. C. 570, decided June 6, 1912, presents the results of a study of the integral costs of water transportation between New York and Galveston, a distance of 2,200 miles. They assigned 60 per cent of the cost to charges incident to docking a vessel, and 40 per cent to the cost of ocean transportation.

"What a Free Port does is to cut down this major item in the cost of ocean transportation, the 60 per cent which goes to terminal cost. It does it, first, by quick service which releases the heavy capital investment in ships and cargo, and makes a rapid turnover possible; it does it, second, by freeing quick capital which may be tied up due to customs regulations; and it does it, thirdly, by cutting down operating costs in the way of handling, due to large scale and specialized terminals located at the crossing of the ways for transportation."

The financial results of the Free Ports, Mr. Kennedy adds, have

been satisfactory to the State as well as to the companies themselves. The State of Hamburg has made on its investment, from 1889 to 1906, 3.5 per cent; from 1906 to 1909, 5.5 per cent, and a somewhat higher return since that time. The shares of the company paid 5 per cent from 1889 to 1905, 5.5 per cent from 1906 to 1908, and were paying 6 per cent in 1913.

We are now in a position to consider the possible application of the Free Port principle to our own country. That there is need of it is the opinion of Mr. Frederic C. Howe, whose memorandum to President Wilson we referred to above. Mr. Howe states that the countries which have substantially free trade do the bulk of the world's carrying trade. He goes on to say:

"They are England, Germany (through her free ports), Belgium, Holland and Denmark. The great bulk of the carrying trade is done by Great Britain. Every country shipped to her ports for clearance, for here there were no obstructions, obstacles, or tariff barriers to interfere with traffic.

"In recent years Germany has competed with Great Britain for the carrying trade of the world. And she has been able to do this through her free ports. By this means a free counter is provided across which goods can be exchanged and transshipped to other destinations.

"America cannot hope to establish herself as the clearing house of the world until cargoes exist with which to fill ships' bottoms. For ships must not only be filled going and coming; they must be able to change their destination and do a tramp trade. As it is now we have cargoes of raw material for Europe and some outgoing and incoming cargoes to South America and the Orient. But our protective tariff prevents the importation of European wares and compels a large part of the transatlantic shipping to go empty one way.

"In addition to this obvious advantage from the recreation of our shipping, the diversion of trade to American ports would cheapen the cost of living. It would aid other businesses, for periodic surpluses of goods would accumulate which would find their way into the country, and would place near at hand many materials needed in industry."

Mr. Howe takes a broad view of the subject, and we are inclined to agree with his position and to believe that anything that can be done to benefit our commerce should be done without waiting for it to manifest signs of degeneration and decay. The tendency of the New York press when the proposition was first put forward appears to have been one of scepticism as to the need of such efforts as would be required to consummate so large a plan. And it is undoubtedly true that the figures covering international trade do not seem to give ground for immediate alarm. The Statistical Abstract of the United States gives the total foreign commerce of the three leading ports as follows, the latest available figures for New York being for the year 1913, and those for Hamburg and London being for 1912:

New York, $1,966,256,617.

Hamburg, $1,960,779,855.

London, $1,866,930,782.

Nor if we turn to home competition do we find the position of New York to be dangerously declining. In 1911 the value of imports into the Port of New York exceeded those of her nearest competitor, Boston, by $874,995,249, and in 1913 by $901,721,178, while New York's exports exceeded in value those of Boston in 1911 by $1,466,013,616, and in 1913 by $1,750,104,509.

We cannot, then, say that the foreign commerce of New York is in a critical position. Let us next see what direct savings would be presumed to result, first in the matter of drawback. As is generally known, when dutiable merchandise is imported into the United States and later exported, usually after being put through some process of manufacture, 99 per cent of the duties paid are refunded. In 1913 the Government paid out in this way over $4,500,000, of which $2,879,000 was recorded at New York. If a Free Port were to be created there would then result to such manufacturers as took advantage of its facilities, a saving of the difference between duties paid and drawback. One per cent of the total amount paid would be $28,790. It is estimated by a custom authority that 75 per cent of this sum is paid by firms located within fifty miles of New York, who would probably take the chief part in a move to establish plants in the free zone. If they all came in they would be able to divide on annual saving of less than $22,000. It is pointed out, further that a considerable part of the drawback is paid on sugar, lead and tin, which is put through various processes in plants which represent a very heavy investment. And quite possibly it would not be found financially profitable to move them. It seems clear that the saving in connection with drawback, even taking into consideration the saving of interest on the principal involved, would be negligible in comparison with the cost of transferring the factories, and the large initial outlay necessary for the establishment of the Free Port. It seems clear, also, that the charges now made by the Government for officials to supervise the operation of bonded warehouses are not so great as to make their saving a really vital consideration to a business handling a hundred million dollars worth of goods annually. It is, of course, obvious that warehousing charges are made within the limits of a Free Port as well as without. And it would be necessary for the warehousemen to consider relocating their establishments within the free zone, or to face the possibility of suffering serious losses through competition with the new warehouses thus advantageously placed. Furthermore, it is possible that the Government would require the Free Port managers to stand the expense of the customs guards who would have to be maintained on the inland side of the free zone.

It would not, therefore, seem to us to be primarily the direct saving in customs routine which would induce the merchants of New York to advocate a Free Port. Mr. Kennedy lays, perhaps, too much emphasis on this point. For example, in discussing the absence of Free Ports in Holland and Belgium, he concludes, "The large percentage of goods duty free, the low tariffs, the small bonded warehouse business and the inconsiderable drawbacks explain why these countries feel that they have a need for a Free Port too limited to pay for an expensive equipment." Now these things do not sum up the case. The almost entire absence of tariff and drawback operations does not explain the greatness of British trade. That greatness is due primarily to the underlying excellence of the British credit system and the skill of British traders. The German commercial growth of the past generation was not due primarily to the machinery of the Free Port of Hamburg. It was due primarily to the skill and industry of the German merchants and manufacturers, aided in all ways by Government co-operation. And, the life blood being there, the absence of all hampering routine of course added tremendously to the development of those great commercial systems. It is on this basis that our belief in the Free Port movement for New York must rest. Many high authorities believe we are upon the threshold of a largely increased trade movement, because our financial system is adapting itself to such development. We cannot expect to win a permanent position in foreign trade merely because our more skilled competitors are for the moment disabled. But if we employ our immense facilities with skill, study the trade situation as the merchants of Europe have studied it, and then strike while the opportunity [illegible] to a degree which will never be seen again, there is [illegible]

lieve that a period of commercial greatness hardly hoped for may await us.

In such a development a Free Port would be of tremendous service. In facilitating trade it is something which the world of commerce understands and appreciates. "It has," as Mr. Kennedy well says, "a standardized 'good will' which has been proved by experience." As such the plan merits the careful study and active support of the country.

In closing, it may be suggested that there is no room in a movement of this kind for local jealousy. New York's natural advantages as a great commercial port have been sufficiently demonstrated by the results. If other ports desire the Free Port privilege, and can obtain the funds required, let them approach Congress on their own behalf. But national interest cannot be subserved by opposing a plan to render greater the world's greatest port on the ground that local records would be damaged thereby. Finally, it may be well to remind those who are approaching this subject for the first time that a highly intelligent and able body of men have given the local application of the Free Port principle the most scientific attention. A competent engineer has pronounced the physical conditions of the Port of New York suitable for the location of a Free Port. The best action which can now be taken is along lines similar to that which induced the Commissioner of Immigration to express favorable views to the President.

INDUSTRY, COMMERCE AND FINANCE

Revenues and Expenses of Railways in the United States for June.—A recent bulletin of the Bureau of Railway Economics states that for railways operating 226,224 miles of line, or about 90 per cent of all steam railway mileage in the United States, operating revenues for the month of June, 1914, amounted to $244,123,428. This amount includes revenues from freight and passenger traffic, from carrying mail and express, and from miscellaneous sources connected with rail operation. Compared with June, 1913, total operating revenues show a decrease of $10,309,159. Total operating revenues per mile averaged $1,079 in June, 1914, and $1,135 in June, 1913, a decrease of $56, or 5.0 per cent. There was a decrease of 5.7 per cent in freight revenue per mile, and a decrease of 4.7 per cent in passenger revenue per mile.

Operating expenses, which include all the costs of maintaining track and equipment, operating trains, securing traffic, and of administration, amounted to $173,747,857. This was $5,728,228 less than for June, 1913. These operating expenses per mile of line average $768 in June, 1914, and $801 in June, 1913, a decrease of $33 per mile, or 4.1 per cent.

Net operating revenue, that is, total operating revenues less operating expenses, amounted to $70,375,571, which was $4,580,931 less than for June, 1913. Net operating revenue per mile of line averaged $311 in June, 1914, and $334 in June, 1913, a decrease of $23 per mile, or 7.0 per cent.

Taxes for the month of June amounted to $12,333,210, or $55 per mile, an increase of 9.3 per cent over June, 1913.

Operating income, which is net revenue from rail and auxiliary operations, less taxes, averaged $256 per mile of line, and in June, 1913, $284, thus decreasing $28, or 9.8 per cent. Operating income for each mile of line for each day in June averaged $8.51 and for June, 1913, $9.47. Operating income is that proportion of their

The operating ratio for June, that is, the per cent of total operating revenues absorbed in operating expenses, was 71.2 per cent, which is comparable with 70.5 per cent in June, 1913, and 68.5 per cent in June, 1912.

When the returns for the six months of the calendar year 1914 are compared with those of the corresponding months of 1913, they show a decrease in total operating revenues per mile of 6.4 per cent, a decrease in operating expenses per mile of 4.0 per cent, and a decrease in net operating revenue per mile of 13.1 per cent. This net operating revenue per mile decreased 21.1 per cent in the East, as compared with the corresponding period of the previous year, decreased 4.2 per cent in the South, and decreased 8.3 per cent in the West.

* * *

American Purchases of Artificial Dyestuffs.—The imports of artificial dyestuffs into the United States have been stationary for over five years, with a slight decline during the fiscal year ended June 30, 1914. The total average purchases from abroad of alizarin and coal-tar colors have been about $10,000,000 annually, but there was a drop in the year just closed to $9,500,000. The imports during the past three fiscal years ended June 30, with the share furnished by Germany, have been as follows:

	1912		1913		1914	
	Pounds.	Value.	Pounds.	Value.	Pounds.	Value.
Alizarin and alizarin colors:						
From Germany.	5,373,087	$1,359,560	7,976,457	$1,797,086	2,593,758	$833,705
From all other countries	75,662	22,376	60,135	20,184	39,656	11,754
Aniline salts:						
From Germany.	4,252,143	337,035	4,545,798	337,832	2,768,191	202,722
From all other countries	548,276	45,671	418,569	32,461	316,276	20,006
Indigo:						
From Germany.	7,032,023	965,017	7,212,451	974,502	7,448,412	938,097
From all other countries	626,044	188,095	500,057	128,395	676,799	155,129
Coal-tar colors, all other:						
From Germany.	.....	5,757,052	.....	5,766,600	.....	5,065,537
From all other countries	.....	1,209,069	.....	1,338,684	.....	1,275,863
Total values:						
From Germany.	.....	8,418,664	.....	8,876,020	.....	7,940,061
From all other countries	.....	1,464,211	.....	1,519,724	.....	1,462,758

Note.—The statistics for indigo include imports of natural indigo from India, which average less than $100,000 worth annually.

The textile and other industries in the United States have been steadily increasing their consumption of synthetic dyestuffs, but the large increase has been supplied from the new and enlarged chemical works in the United States, the value of whose output was $7,350,748 in 1899, $10,912,224 in 1904, and $16,428,676 in 1909. This ratio of progress indicates that the American chemical industry is responding to the expanding domestic demands for synthetic colors. Adding the imports to the domestic production there was apparently a consumption in the United States in 1909 of over $25,000,000 worth of these articles.

* * *

The Production of Natural Gas in the United States in 1913.—The production of natural gas in the United States in 1913 was the greatest in the history of the industry, surpassing that of any previous year in both quantity and value. The total gas production in 1913 is estimated by B. Hill, of the United States Geological Survey, at 581,898,239,000 cubic feet, valued at $87,846,677, an average price of 15.10 cents per thousand cubic feet, as compared with a production of 562,203,452,000 cubic feet, valued at $84,563,957, an average price of 15.04 cents, in 1912, the increase being 19,794,787,000 cubic feet in quantity and $3,282,720 in value. Of this total product, about 32 per cent was utilized for domestic purposes, or 184,885,662,000 cubic feet, valued at $50,522,415, an average price of 27.33 cents per thousand cubic feet, and 68 per cent was utilized for industrial purposes, or 397,012,577,000 cubic feet, valued at $37,324,262, an average price of 9.4 cents. The industrial consumption includes gas used for both manufacturing and producing power.

INSURANCE

Articles on the Theory, Practice and Experience of Insurance.

Notes on Insurance, American and Foreign.

Items of Insurance News.

THE severity of the business contraction which has been brought about by the European War is making itself felt with the life insurance companies in the United States, in the form of an unprecedented demand for loans on policies. Even the panic of 1907 caused no such general recourse of policyholders to the accumulated savings represented by the reserves on their life insurance policies, in so far as those reserves are loanable to the insured. A marked feature of the present borrowing on policies, we are informed, is that a very much larger number of loans than ever before is sought by the smaller policyholders, those belonging to the class of clerks and similar employes. The smaller business men, also, are appearing in very considerable numbers. There is virtually none of the borrowing by rich or very well-to-do persons, desirous of taking advantage of the low prices of securities, in order to make a speculative profit upon the return of prosperity. This kind of borrowing was very noticeable at the time of the panic of 1907 and also in connection with the semi-panic of 1903. It was peculiarly irritating to the officers of the life insurance companies, because it emphasized for them the anxieties of the disturbed financial conditions, compelling them to some extent at least to sacrifice their own securities in an excessively weak market, in order that the least necessitous class of their policyholders might use the money to buy, perhaps, the very securities thus sacrificed, with a view to making money on them. As things now are, however, there is little disposition on the part of anybody to take money which is safe, for the purpose of investing it where it may show a very considerable shrinkage before the final adjustments of the huge military expenditures and the great economic losses of the belligerent countries in Europe shall have taken place and some idea can be formed of the price which capital will command for the next generation.

Nor is there much indication now that policyholders of what may be called the middle groups,—i. e. having neither very small nor very large policies,—are borrowing on these policies for the sake of buying automobiles or of obtaining any other kind of luxuries. For a decade past this kind of borrowing has not merely irritated, but shocked everybody having to do with life insurance. Inasmuch as life insurance has become what it is in this country through the cultivation of the instinct of duty towards the family, always exposed to the possibility of becoming suddenly dependent as a result of the death of its money-earning head, it has inevitably seemed to earnest men engaged in life insurance a flagrant abuse of unintended opportunity and essentially a breach of trust towards the policyholder's nearest and dearest, for him to diminish the protection provided for these in the event of his death and their helplessness, in order that he may gratify a mere desire for pleasure or satisfy an impulse of idle vanity. There is little trace of these motives, however, in the present borrowing on life policies. Stern reality has taken the place of cheerful and irresponsible optimism in the minds of the great mass of Americans with moderate incomes. Their last thought nowadays is of mortgaging the future for the sake of a present gratification. In fact, the greater part of them have either nothing at all or else are forced to put up with greatly reduced incomes. The necessary severity with which business enterprises have reduced their staffs to fit the business they are doing has left great numbers of even the better salaried employes without any regular income at all; and the smaller independent business men are compelled to adopt the greatest economies and to gather together every available resource, in order to keep their heads above water. It is from these necessities that the present insistent demand for loans on life insurance policies arises.

Nowhere has the abuse of life insurance policy loans been more sharply criticised than in the columns of this paper; and nowhere have the unanswerable arguments against this abuse adduced by the most far-seeing representatives of life insurance been more sympathetically received. It has, however, been suggested more than once by us that perhaps the extraordinary growth of life insurance in this country, particularly marked in comparison with the relatively very slow growth of savings banks in recent years, has been in no small part due to an instinct in the average man that he may not improperly look upon the accumulating loan value of his policy as savings which he hopes not to be compelled to draw upon, but which he is justified in drawing upon, in case of real need for money during his own life. In other words, the doubt has more than once occurred to us whether very large numbers of persons in the United States (and their prospective beneficiaries also) have not substituted for the old strict conception of life insurance as the fulfilling of a duty to the possibly dependent family, a decidedly more flexible conception of it as a combination of savings (to be drawn upon, if need be) and of family protection. And, as has been said above, it has seemed to us possible that the very growth of life insurance among us, far outstripping anything known in any other country in the world, is an evidence of the correctness of this conclusion.

It is, of course, undeniable that very serious problems are created for the officers of life insurance companies by this turn of affairs. The trouble is not so great if the cash premium income of a given company is sufficient to meet death losses and management expenses, and still leave enough cash to provide for the policy loans called for. If, however, it becomes necessary to sell out the securities, or any part of them, in which the reserves called for as cash loans are invested, then the difficulties of the officers of the company begin. The very conditions which have brought about the demand for policy loans have also brought about a severe decline in the market value of securities. In almost every case when securities are sold out on such a market as now exists there will be a substantial loss as between the price originally paid and the price realized. Then the question arises as to the allocation of this loss. The problem is exceedingly complex, not so much in respect of the mere accounting, as in respect of the fundamental equities. But to discuss it would be out of place here.

Fortunately, so far as we know, none of our American life insurance companies have yet reached the point of having the calls upon them for policy loans exceed the balance of free cash, over and above death losses and management expenses, derived from their premiums. As yet, they have been able to treat these loans as fresh investments, of course absolutely safe, so far as the companies are concerned, and yielding a rate of interest much above that obtained from their investments in securities. It is only in case the economic disturbance of the world should be prolonged beyond what seems humanly possible, that the problem stated above will become a vital one for the companies. It is, however, a problem to which they should be giving serious consideration even now. It is remotely possible that the proper solution and handling of it might become a matter of life and death to the companies.

THE HEALTH OF THE EMPLOYE

An Argument for the Physical Examination of Industrial Workers

By William Hall Coen, M. D.*

WERE any employer of labor to be asked which he would prefer to employ, a well man or a sick man he would undoubtedly consider that he had been asked a nonsensical question and, if he replied at all, would probably state that he would not employ a sick person if he were aware of that person's illness.

Were the same employer asked, however, "How many of your employes are in good health and able to give you their best work?" an answer might not so readily be forthcoming, although in either instance the query would be much the same in intent and purpose if not in actual wording.

Still another and pertinent question might be asked. Is it advisable for you as a manufacturer to maintain a system of medical supervision over the health of your employes, and should you by chance succeed in employing only those persons in good health is it for your best interests to take measures to insure if possible the continuation of this state of good health during employment?

This last question I have asked of several employers in your industry and I have received several different sorts of replies. Some have stated that they believed that this work might be taken up with material benefit to themselves and their employes. Some have flatly said, "No, it cannot be done." Others have said substantially this: "When we have provided well-lighted, sanitary factories for our employes and have paid them the best wage consistent with the industry, we feel that our responsibility ceases and that any other work directed toward the betterment of the health or other condition of the employe should have its place without the mill and should not concern the mill management." Such a statement as the last quoted has been made to me by men for whose judgment and sagacity I have such respect that I would hesitate to set forth my personal opinion against theirs were it not that from my own experience I have become convinced that the medical supervision of employes is advisable and that it can be made an economical procedure, of advantage not only to the employer but to the employe as well. I am strengthened in my belief by the fact that the plan is now successfully carried out in certain lines of industry.

That this phase in the relation between the employer and employe has been given thought by a former president of your association is shown in the following quotation taken from the address of your president in September, 1912, who said at that time: "Another plan of work which is being suggested and carried into effect by some of the larger corporations is the system of resident nurses, the object being to put in each mill a competent woman who will watch closely the physical condition of the women and girls in the establishment with the idea of advising them how to live wisely. It would probably not only pay the corporation from a money point of view, but will undoubtedly enable the corporation to perform a duty which perhaps many of us have overlooked."

I feel that it is almost unnecessary for me to do more than mention in passing the good that is to be had through an observance of the principles of factory sanitation, for to a manufacturer who fails to recognize and follow out these principles any appeal directed toward the betterment of the health of employes must be made in vain. It is highly probable that to-day the greater number of manufacturers recognize the advantages that come through the maintenance of clean, well-lighted, sanitary factories in which the comfort of the employe is carefully looked after. People work better under conditions of good light and cleanliness and it has been found that more and better goods are produced in factories where such conditions obtain than in similar establishments where work is carried on under lower standards of sanitation. So well are these facts recognized that modern factories are designed so as to utilize to the best possible advantage all available lighting areas, and to provide for every modern appliance of mill sanitation. All this, however, is not done because of sentiment, but for the very good reason that it pays, and pays well.

It would also pay, it seems, to people these factories with employes in good health capable of giving their best efforts through each working hour of the day and to provide for their continuance in good health by a carefully planned and carefully carried out system of medical examinations and inspection.

In giving my reasons in support of this belief, I wish it to be clearly understood that it is no purpose of this communication to associate conditions of ill-health in employes with the process of manufacturing cotton. Your industry, in this country, gives employment to approximately 500,000 persons and the natural occurrence of disease among this number of people would be sufficient cause for you to employ methods of medical supervision without reference to any hazards the industry may or may not possess.

Statistics on the causes of mortality among cotton operatives have been collected and published and have been used as the basis of criticism directed against you, but I cannot find that your association or any other association of the textile industry in this country has so far concerned itself as to gather accurate information concerning the vital statistics of that very important factor in your scheme of production, your employe. You have ample and carefully collected data relating to other details of your business, but you have passed by a field which might well be cultivated with profit, and have left for others the collection of facts concerning a subject with which through your own efforts and out of your own experience you could be fully and accurately informed.

Neither is it my purpose to outline or discuss in this paper any phase of the so-called welfare movement directed toward the betterment of conditions under which persons labor and live. I wish solely to point out to you why you can interest yourselves in the health of your employes to your own advantage and to the advantage of the people working for you.

The delay in the recognition of ill-health and the causes of ill-health among working people is due to several causes. Among these causes are:

(a) The lack of sufficient appreciation on the part of business men of the health of employes as a factor in industrial efficiency.

(b) The absence of a systematic supervision of the health of employes while at work.

(c) A lack of knowledge on the part of employes concerning the maintenance of their health, and the prevention of disease.

That the average manufacturer has failed, apparently, to consider the health of his employes a factor in the efficiency of his business, is shown when the conditions prevailing in the average factory is considered. A manufacturer builds his mill with due regard to economy of space and places in it machines designed to produce at the lowest possible cost the materials for which they are intended. That these machines may be kept at the highest point of efficiency a force of mechanics is maintained who quickly adjust any irregularity in their action that work may go on as far as possible without interruption. For the work of the machine carefully selected material the product of other machines, is prepared,

*An address before the semi-annual meeting of the National Association of Cotton Manufacturers, Lenox, Mass., October 1, 1914

and then, when all is ready the machine is useless unless there is some one at hand who is skilled in its use. And this some one must constantly watch the machine to see that it does its work properly and to remove from it the finished product. The employe in charge of the machine must be alert and on the watch for broken ends or imperfections, correcting each fault as it comes to his notice when it is possible for him to do so.

In other words, the efficiency of any machine rests upon the efficiency of the person operating it. You can speed a machine to its limit, but the material passing through will suffer if the person in charge is careless or inattentive, and time will be lost even though the imperfections in material may later be removed or repaired. This carelessness or inattention of the employe may be due to causes over which you can have no control and which no amount of work on your part could remove or anticipate. On the other hand, this carelessness or apparent inattention may be due to causes which you can remedy when you have found their cause.

Many instances have come within my personal notice in which the need for the medical supervision of employes was made apparent. The following instance illustrates what might have been avoided had a system of medical examination been in force in one cotton mill. In a certain mill where cotton cloth was made there worked at one time side by side three girls. These girls are now dead and the death certificate of each was signed "tuberculosis." It appears that while two of the girls were in good health there came to work beside them a third who was not well and had a cough, but who was not so ill but that she could manage in some way to get through her day's work. This girl continued at her employment for some months and then left her work, dying from consumption shortly afterward. It was not long before the two girls who had worked beside her showed symptoms of the disease, and were eventually obliged to leave their work. Both of these girls died of consumption undoubtedly contracted from the girl who had the disease when she entered the mill. How many others there were who were also infected there is no way of knowing, but it is not at all improbable that other persons were infected from this source.

These three girls were at the time they were obliged to leave their work, trained employes in a process requiring a considerable deftness of hand and quickness and accuracy of sight. To fill their places other employes had to be secured and taught to do the work. All this took time, and for the while the work at hand had to suffer until the new employes had become as proficient in the work as those who had left because of sickness. I will not attempt to estimate the monetary loss to the mill or to the community because of the loss of these workers. Those who have studied the monetary value of the worker in early adult life place this loss at a high figure, and no account is taken of grief, suffering or family loss, although when these enter our own experience they are by no means a negligible quantity.

The fact that these girls died from a preventable disease may not concern you, but the fact that two of the girls developed the disease in the mill and that through loss in efficiency and death the mill suffered a financial loss, must concern you.

That the situation just described may present itself in any mill or factory, may be understood by giving attention to the situation relative to tuberculosis in a state where registration statistics are available.

In the ten years, 1900-1909, about 64,000 persons died from tuberculosis in Massachusetts, and at the present time tuberculosis in all its forms causes about one-ninth of all the deaths in the State. The disease prevails in young adults and seems to associate itself with those who have failed to recognize and adopt the better standards of living.

It has been estimated that there are at present some 35,000 persons in Massachusetts ill with the disease.

Tuberculosis, however, by no means represents the only cause of ill-health possible in employes. Other organic diseases and physical defects are present in the mill employe as well as in the mass of people at large and correspondingly affects his capacity for work. Physical defects increase materially the hazards involved in any occupation. An epileptic in one of his seizures is liable to fall into moving machinery; an employe with a hernia may aggravate this affliction through strains in lifting. The employe with diseases of the heart is susceptible to heat, exposure or sudden exertion. Employes suffering from varicose veins may develop varicose ulcers or infections through slight abrasions, and a deaf employe is particularly liable to accident. Defects in eyesight or partial blindness may become total blindness from an accident to the good eye. Contagious diseases may spread from one employe to another.

Another cause for the examination of employes lies in the situation now arising out of the workmen's compensation laws. These laws have considerably increased the value of physical examinations because of the removal of the employe's responsibility for the accident, and the inclusion under the law of diseases both of an occupational type and of acute types that may develop from physical exposure during employment. In Massachusetts the Industrial Accident Board has defined as a "personal injury," "Any injury or damage or harm or disease which arises out of and in the course of the employment which causes incapacity for work and takes from the employe his ability to earn wages."

This definition of "personal injury" has been upheld in a decision sent down by the Supreme Judicial Court in the case of Johnson vs. London Guarantee and Accident Company, Ltd. In this instance an employe, seventy-two years of age, a paint grinder by occupation, became unable to withstand the influence of the poison due to lead constantly introduced into his system, the result leading to his inability to work. Here it was held by the court "Under the act 'personal injury' is not limited to injuries caused by external violence, physical force, or as the result of accident in the sense in which that word is commonly used and understood, but under the statute is to be given a much broader and more liberal meaning."

This decision is wide reaching in its importance, for although in this instance the injury arose from the effects of a mineral poison, it was nevertheless the result of the employe's occupation on his bodily health.

Similar opinions have been handed down by the Industrial Accident Board of Massachusetts, some of which have been appealed to the Supreme Judicial Court, while others have been uncontested.

In the case of Black vs. Travelers' Insurance Company, adjudicated by a committee of arbitration, an employe in a furniture factory received an injury to his ankle which arose out of and in the course of his employment. Some time later he became incapacitated for work, and three months from the time of his injury died of tubercular meningitis. It was held that the injury was a predisposing cause of the disease, and the widow was allowed compensation for a period of three hundred weeks at a rate of $8.25 per week.

Two facts showing the importance of the medical examination of employes appear in this case. In the testimony before the committee it was shown that some two years before the date of the injury, the man had suffered from a condition generally associated with tuberculosis. It was also shown that the injury, a fracture

at the ankle, was neglected by the patient as he appeared not to recognize its nature, and that for two weeks after the injury he continued at his work until compelled to quit because of pain.

Under a proper system of examination of employes such an occurrence as that noted should have been prevented. The injury perhaps could not have been foreseen, but had the man been a sufferer from tuberculosis his condition would have been known, and he would probably have been placed under suitable treatment outside the factory. With a competent physician at hand the injury to his ankle would not have gone unrecognized for two weeks

For an injury to the ankle received by a young woman while at work in a cotton mill, and which resulted in a tubercular affection, compensation for total incapacity for work has been awarded in a recent case settled by an arbitration board. This case was not further contested after the award was made.

Compensation has been awarded by a committee of arbitration for pneumonia resulting from colds and exposure, arising out of and in the course of employment.

In the case of Herrick vs. Employers' Liability Assurance Corporation, Ltd., compensation was awarded because of the death of an employe from strangulated hernia following an injury arising out of and in the course of employment. In this case it appears that the employe, a heavy man, had a fall on December 18, and on January 25, had another fall. On January 26, the employe was treated for acute indigestion, and remained home for a week or ten days and then returned to his employment and worked for two weeks or more, calling a physician on February 11, who afterward found a hernia on March 3 or 4. In this instance had a system of medical examination been in force in the factory in which the man was hurt, the injury which afterward resulted in his death might have been discovered and suitable treatment given.

In the case of Hurle vs. American Mutual Liability Insurance Company, compensation to the amount of $3,952 was awarded, because of total incapacity for work caused by loss of vision.

In this instance the employe's loss of vision was attributed to certain noxious gases which caused degenerative changes in the optic nerve.

Here again it would seem, an efficient system of medical inspection and examination would have anticipated the loss of sight.

In each of the cases quoted one question comes to mind.—What was the physical condition of the employe before he became ill or was injured?

Because of the interpretation which has been placed upon the meaning of "personal injury" if for no other reason, it would seem not only practicable, but necessary, that an employer should know the state of health of each of his employes. An initial physical examination at the time of employment or periodic examinations during employment would undoubtedly serve to prevent certain diseases and various types of accidents by affording the employer the warning of the employe's weakness. This procedure would undoubtedly minimize accident hazards, and where there existed a latent diseased condition, would prevent the condition from becoming acute.

Such an examination would also serve to prevent the infection of one employe by another. The liability of the employer for such a type of injury is suggested in the case of Hood vs. Maryland Casualty Company, 206 Mass. 223. This was a suit by an insured against the insurance company under a policy which was to insure the plaintiff against any accident suffered by an employe "in and during" the operation of the trade or business described in the policy. An employe contracted glanders while working in a stable which had been occupied by horses which had glanders. He sued the present plaintiff and recovered; the plaintiff sought reimbursement under the policy. The court held that the accident came within the policy.

This case is cited because it has recently been used in a brief submitted to the Industrial Accident Board where claim was made that an employe had become afflicted with a disease communicated from a fellow employe during employment. Because of the financial inability of the plaintiff to collect proof of injury the case was not decided. The plaintiff in this case was at the time of his injury an employe in a cotton mill.

The value of examinations as a means of detecting physical conditions in employes that render them unusually susceptible to disease or industrial injuries, has been recognized in a general way for some years. In certain lines of employment, such as steam railways, a complete physical examination of all new employes responsible for train operation is now standard practice, and this practice is gradually extending into other industries. Many large establishments which have as yet not taken up actual examinations of employes have provided for their first care in accident through hospital rooms or dispensaries in the factories, while other establishments have employed nurses in order to maintain a better standard of health among their female employes. Other large establishments have taken up the physical examination of applicants for employment and have provided for the periodical examination of employes during service. In one establishment in Chicago, in which some 8,000 persons are employed, and in which for some time a careful system of medical supervision has been carried out, the standard of health and resultant efficiency among the employes has been markedly increased. The physician in charge at this establishment states, "This work has raised the standard of health of our present working force to a very high degree. In tuberculosis alone we have reduced the number of tubercular cases occurring among our old employes over 80 per cent, as compared with five years ago. The employes look very kindly upon our efforts to safeguard their health. Naturally, at first, they were a little dubious as to the real reasons for this safeguarding; but as their confidence in us has increased, so also has the opportunity for helping them."

Representatives of other establishments in which this plan of medical supervision is carried out have expressed themselves as satisfied that it is an economical procedure.

In a recent conversation with the management of a corporation employing in this country some 65,000 people, I was informed that although the company already provided for the first aid treatment of injured employes, it contemplated going still further and was about to carry into effect a system of medical examination of employes for the reason that they felt such a procedure to be both practical and necessary.

If any member or group of members of your association should consider it practicable to establish a system of medical supervision the following results might be reasonably looked for:

(a) The health of the working force of the factory would be protected by the elimination of sources of infection.

(b) The physical deterioration of employes would be prevented by the early detection of disease and the immediate institution of measures directed toward treatment.

(c) Unnecessary financial loss to the employer should be prevented through the recognition of any slow growing reduction of the working power of employes through disease

(d) Personal injuries should be prevented through a knowledge of an employe's weakness to any hazard.

(e) A higher standard of the entire working force might be achieved through a system of individual and general instruction having as its object the increase of the resisting power of employes

below grade and the preservation of the health of those below normal condition.

The establishment of a system of medical examination and supervision in your factories presents no difficulties not easily overcome. Any such plan, however, should be carefully worked out with reference to the needs of each establishment or group of establishments, for several small factories in a community might combine in the work to good advantage. Too much should not be attempted at first, the change has been slow in coming and time should be taken to work out details carefully under the direction of a competent person. The work should result not only in a betterment of the health of the employe, but also in a better understanding between the employe and his employer. The work should also pay in dollars and cents because an establishment in which the standard of health is high should command a better insurance risk than one in which the standard is poor or indifferent. I have had it stated to me by an official of one of the largest liability insurance companies doing business in Massachusetts that there should be no expense connected with a well thought out and carefully conducted system of medical examination in any factory, because such a system would undoubtedly pay for itself in the reduced cost of insurance given to such an establishment.

The reasons for the medical examinations of employes as outlined in this communication while addressed to you as cotton manufacturers have equal reference to conditions in any establishment in which people are gathered together under the factory system.

THE RESPONSIBILITY OF A LIFE ASSURANCE COMPANY FOR THE ACTS OF ITS AGENTS

By Robert Thodey, F. I. A.*

(Continued from Page 335.)

Assuming the legality of the business it is proposed to write being beyond dispute, we may now further consider the agent in his capacity as a writer of new business, and ask in what degree the office employing him is responsible for his acts when obtaining completion of the proposed form by the prospective policyholders.

There are two sets of circumstances often alleged in connection with proposals—(1) that the agent misrepresented the contract, and (2) that the agent filled up the proposal incorrectly. As will easily be seen, both may be alleged in one case, but it is proposed to deal with them separately.

Misrepresentation of the terms of the contract has been a common ground for action against insurance companies. How serious its consequences may be can be gauged from the fact that one company (the Artisans' Free Home Assurance Company, alleged as one reason for its downfall, "Litigation instituted by certificateholders on acocunt of representations, or statements alleged to have been made by agents of the company, which, if made, were in contravention of the company's prospectus and instructions."

Some ten or twelve years ago a good many cases occurred in connection with the bond investment companies, which were then causing considerable scandal in England on account of the rash promises made. These bonds were issued promising, on certain conditions, loans after policies had been in force for some years, and, from their terms, evidently lent themselves to misrepresentation. Plaintiffs desiring rescission of contract on the ground of misrepresentation by agents met with varying fortune, some of the companies having been careful to insert in their proposal forms clauses such as:

"I hereby declare that the answers made by me to the above questions are true, and that I have made myself acquainted with the terms of business of the company contained in the above-mentioned prospectus (a copy of which I have in my possession), and that this proposal is based upon the terms, statements and representations written or printed upon it, and in the said prospectus, and upon no other."

One form of proposal had printed on the back:

"No application can be entertained excepting under the terms of the prospectus, and the usual bond conditions. The company will not be responsible for any verbal statements made by any person."

About the same time that the bond investment companies were in trouble, two assessment companies operating in England also had to face considerable litigation. One of the companies issued forms of contract which the House of Lords concurred with the Court of Appeal in describing as "tricky" (Foster v. Mutual Reserve Fund, 1904), and approved the rescission of the contract. Following on this case, in which misrepresentation by the agent does not appear to have been alleged, there were others in which the plaintiffs were successful on the ground that they had been deceived by the agent. In one case (Mack v. Mutual Reserve, 1905), the company accepted responsibility for letters written by their agent. In another case (Scar v. Mutual Reserve, 1905), the plaintiff was late in protesting against the increase of premiums, and, although rescission was allowed, mainly on the ground of the extreme difficulty of understanding the documents put forward by the company, he was not allowed costs.

A case decided in America (Clements v. Life Insurance Company of Virginia, 70 S. E. Rep. 1076, Supreme Court of North Carolina), shows that a policyholder alleging misrepresentation on the part of the agent must take prompt steps to assert his rights, and must not continue to pay premiums and so acquiesce in the terms of the policy. (A long extract from this interesting judgment appears in Volume XII, Transactions of the Actuarial Society of America, pp. 276 7.) In another case decided on the same day by the same judge (Briggs v. Life Insurance Company of Virginia), the policyholder "was unable to read, and the agent read the policies to him, misreading them in so doing. The court held that the plaintiff had the right to depend on the agent to read the policies correctly to him, and that if he did not so read them, the company was liable for the fraud." Both these decisions strike the reader as dictated by sound common sense.

Before passing on to the next section it is necessary to refer to the case of Kettlewell v. Refuge (1907), 2 K. B. 242; (1909) A. C. 243, which caused considerable comment at the time. It hardly has a direct bearing on the point under discussion, as the misrepresentation arose after the policy had been in force twelve months, and, moreover, was made not by a canvassing agent, but by a superintendent. As, however, it is a class of misrepresentations an industrial collector might easily make, it is important to allude to it here. Briefly, the plaintiff, after paying premiums for a year, proposed to discontinue, but was induced to continue on the superintendent's representation that if premiums were paid for five years she would be entitled to a free policy. This representation was untrue, to the knowledge of the person making it, and the plaintiff secured a refund of premiums paid since the date of the misrepresentation. The case went to the House of Lords, but the decision of the court below was affirmed without comment. One would have liked to have seen all the documents connected with this case, since it appears from the Board of Trade returns that the Refuge did, at the time the policy was issued, grant free or paid-up policies in respect of adult industrial assurance five or more years in force. The policy was, possibly, on an infantile life.

In connection with misstatements and irregularities appearing in proposals, it is necessary to remember that the peculiarity of

his height and weight incorrectly in the proposal form, and that he did not know they were wrong, while the agent of the company did know! On appeal the company was successful, the judgment containing the following:

"The finding of the jury in answer to the second question was preposterous, and could only be explained by the fact that the plaintiff was a poor man and the defendants were a rich corporation. To suggest that the agent knew that the height and weight inserted in the proposal form were incorrect, while the plaintiff did not, was absurd. If any one was likely to know the plaintiff's height and weight it was the plaintiff himself."

In some States in America, in which it is customary to annex a copy of the application to a policy, the question of the company's responsibility should an agent fill up a proposal incorrectly can hardly arise. There is a case directly bearing on this point (New York Life v. Fletcher, Supreme Court of the United States, 117 U. S., 519), in which it was pointed out that the policyholder had every opportunity of finding out the fraud which had been perpetuated not "only upon himself, but upon the company," and it was "his duty to make the fact known to the company. * * * The retention of the policy was an approval of the application and its statements."

Some attempts have been made in America to hold the company responsible where incorrect answers have been given to the medical examiner and the proponent has afterwards informed the agent of the errors, the contention being that the knowledge of the agent is the knowledge of the principal. In at least two appeals (Nettie Butler v. Michigan Mutual Life Insurance Company, and Mallen v. National Life Association) the companies were successful, it being held that what passed between the proponent and medical examiner was no concern of the agent as agent of the company.

When discussing the effect of misstatements in proposals we are reminded of an older case than Biggar v. Rock Life Assurance Company, viz., that of Bawden v. London, Edinburgh and Glasgow Assurance Company (1892, 2 Q. B., 534), in which inaccurate statements inserted in a proposal by the agent led to the company being held liable under the policy. These two cases have appeared hard to reconcile, but an examination of the report of the older case shows that the proponent was illiterate, and almost unable to read or write, although he could sign his name. This fact alone seems sufficient to explain the different decisions, for it is a matter of common knowledge that more than usual care is necessary when dealing with illiterate persons. But if a man of education and intelligence claims that he signed a proposal without reading it the courts would presumably only in very exceptional circumstances allow him to repudiate responsibility for his action. Business otherwise would be quite impossible.

A recent case, however (Thornton Smith v. Motor Union Insurance Company, Limited), has again raised doubts whether companies are free from responsibility when the agent inserts misstatements. The plaintiff, who had made numerous claims on another company in respect of a motor car policy, was told by that company to take his business elsewhere, and insured with the defendants. He informed the agent of defendants of his previous experience, but the first proposal reached the company with the questions re previous insurance answered in the negative, while the proposal in respect of another motor car was signed in blank. Both policies were held to be valid. (See J. I. A., Vol. XLVIII, pp. 199, 200.)

All policies are subjected to conditions. These conditions may sometimes be waived, or the terms of the contract altered, by agreement with the company. As a general rule the agent has no power to alter a policy or any conditions therein. From time to time,

however, we come across agents who are foolish enough to take upon themselves the responsibility of allowing the assured to exceed the days of grace, a practice which is fraught with so many dangerous possibilities that nearly every policy form contains a distinct condition notifying the assured that in this respect the agent's authority is non-existent. The proper observance of days of grace is important in industrial business—(1) because of the necessity for upholding the policy contract, and (2) to ensure the accurate calculation of the agent's earnings when the "maximum-debit" system prevails. One industrial policy form which has come under my notice contains the following as a condition: "No agent is authorized to make, alter or discharge any contract, or waive any forfeiture."

As in every other case in which the agent intervenes, attempts are made from time to time to show that the agent's action is a waiver of some policy condition, but the legal difficulties in the way of proving such contention are considerable, for it is one of the general rules of evidence that "when * * * any contract * * * has been reduced to the form of a document or series of documents, no evidence may be given * * * of the terms of such contract * * * except the document itself. * * * Nor any the contents of any such document be contradicted, altered, added to, or varied by oral evidence" (Stephens' Digest of the Law of Evidence, p. 95, edition of 1893). It is possibly to emphasize the existence of this rule, and to take full advantage of it, that some companies notify on their policies that they contain the whole contract between the parties.

A very interesting paper entitled "The Four Parties to Waiver," was read before the International Association of Accident Underwriters, Ontario, Canada, 1905, by Mr. Shepherd Bryan. [Extracts from this paper are reprinted in the "Insurance Record" (London) for the same year, pp. 404-5.]

The question of the authority of an agent to extend time for the payment of premiums was considered by the Supreme Court of Mississippi in the case of the New York Life Insurance Company v. O'Dom (56 So. Rep. 379). The policy here contained a stipulation that no agent was authorized to waive forfeitures, etc., but it was sought to bind the company on the ground that its agent (in this instance a cashier employed at a branch office) had agreed to accept two days after the expiry of the days of grace a dated-back cheque. The Court of Appeal, holding that the policyholder had received full notice of the cashier's inability to bind the company in the way suggested, gave judgment for the company. A local case now fairly old apparently decided on the same ground, is O'Mara v. National Mutual Life Association (1892), 4 Q. L. J., 121.

In another case (Slocum v. New York Life Insurance Company, U. S. Supreme Court, 288 U. S., 364) portion of a premium due was paid to the agent, a form being left with the policyholder's wife to enable him to create a lien on his policy for the balance. This document was not signed by the assured before his death, and the company successfully disputed its liability on the ground that the payment of the premium had not been properly completed. As against this, however, we have an Australian case (Equitable Life Assurance Society v. Bogie, 1905, 3 C. L. R., 878) in which the "company, after arranging to advance a policyholder a sufficient sum to pay overdue premiums," was held "bound to treat the premiums as paid, even before a proper security was given over the policy." It is, of course, possible for the company to waive a condition in its policy relating to payment of premiums by neglecting to insist on the premiums being paid on the dates or within the time stipulated in the policy, and in Slocum's case the court alluded to the fact that the policyholder was enjoying a contract the terms of which had been modified by the company's practice.

The author of the paper "The Four Parties to Waiver" quotes another rather important case, decided by the Supreme Court of Georgia in 1902. The plaintiff had effected an accident policy, and had, at the instigation of the agent, as he alleged, omitted to state in his proposal form that he was suffering from a physical infirmity. The policy contained a clause exempting the company from liability due to such infirmity and also a stipulation that "no agent has power to waive any condition of this policy." It was held, on the company contesting its liability to pay on the assured meeting with an accident, that he could not recover as the agent had no authority to waive the condition regarding physical infirmity. This decision is the more interesting as it has a direct bearing on the responsibility of the office for the acts of its agents in withholding information that should appear in the proposal.

As all well-conducted life offices set their faces rigidly against any interference with the existing business of a competing office, there is not much necessity to refer at any length to the subject of "twisting." The practice, it is to be feared, exists to a somewhat large extent in industrial assurance, usually on the agent changing his company, although, necessarily, it is very hard to obtain satisfactory proof. The "transfer," as it is called, of a policyholder from one industrial company to another is made an offense by the English Collecting Societies and Industrial Assurance Companies Act of 1896, unless the policyholder transferred gives his written consent and the company to which he is being transferred gives prompt notice to the company from which he is being transferred. From time to time cases occur in the courts in which agents, and sometimes the companies themselves, are fined for non-compliance with these requirements of the Legislature.

Similar legislation would probably be a benefit in Australia, although some companies have lately been taking steps to minimize the evil by requiring their agents to agree, as a condition of their employment, that they will not approach any policyholders of the company they have left with a view to policies being effected in another company, and these agreements have been upheld by the courts as not being sufficiently in restraint of business to warrant their interference. An agreement of this nature, to be readily efficacious, requires the nomination of a sum of money to be recovered as liquidated damages. It is not worth while dragging an unsatisfactory agent through expensive Equity Court proceedings to obtain redress.

(To be Continued)

BIG AND LITTLE COMPANIES COMPARED AS TO LOSSES AND EXPENSES

[We have been favored with the following interesting communication from a Western correspondent, who, although desirous of remaining anonymous, has made it possible for us to check up the tabulation appearing at the end of the article. The figures are from a compilation for 268 stock fire companies, as of December 31, 1913, published in Best's "Insurance News," March 15, 1914, pp. 171-175.—Editor.]

THE following table shows the loss and expense ratios of six groups of fire insurance companies arranged in the order of total amount of assets reported December 31, 1913. The figures are for the year 1913. The total number of companies in this compilation is 268. The smallest companies—those having assets less than $500,000—form by far the largest group, while the largest companies—those having assets in excess of $10,000,000—comprise the smallest group.

Both as to losses and expenses the largest companies seem on the whole the most fortunate of them all. No other group can boast

such a low loss ratio, and only one other—the group having assets between $5,000,000 and $10,000,000—claims a smaller expense ratio, and the difference is very slight.

The smaller companies have the largest loss ratios. The difference between the average loss ratio of the smallest companies and the largest is nearly 10 per cent. The decrease in the loss ratios is quite consistent from the smallest companies to the largest, there being but one exception, i. e.—in the group of companies having assets between $1,000,000 and $2,000,000.

It would seem that the smallest companies are so far as straight underwriting is concerned a losing proposition. The sum of their average loss and expense ratios is nearly 103 per cent of the premiums written. On the other hand the largest companies have the greatest underwriting profit apparently, the sum of the losses and expenses being but 91.3 per cent of the premiums written. For some reason the companies having assets between $2,000,000 and $5,000,000 have a combined loss and expense ratio greater than either group just above or below.

Number of Companies Reporting.	Having Total Assets of	Total Premiums Written.	Total Losses Paid.	Total Expense.	Ratio Losses to Premiums.	Ratio Expenses to Premiums.
90 less than	$500,000	$7,435,403	$4,614,960	$3,032,093	62.1%	40.8%
54 less than	1,000,000	16,992,193	9,487,143	6,602,564	55.9	38.9
59 less than	2,000,000	39,457,041	20,859,555	15,621,435	52.9	39.6
35 less than	5,000,000	62,334,734	34,504,763	25,135,437	55.4	40.3
18 less than	10,000,000	66,962,910	36,052,855	25,973,041	53.8	38.8
12 more than	10,000,000	105,813,292	55,292,931	41,235,868	52.3	39.0
268		$298,995,573	$161,112,207	$117,601,438	53.9%	39.3%

NOTES ON INSURANCE, AMERICAN AND FOREIGN

Employers' Liability Insurance in Great Britain in 1913.—A recent issue of the "Post Magazine and Insurance Monitor," of London, makes it possible for us to give a summary of the results of employers' liability (workmen's compensation) insurance in Great Britain in 1913. Of particular interest to American readers are the evident efforts of the British companies to supplement the increased rates that it has been found necessary to charge by a rigid holding down of expenses and commissions. The grand total of premiums collected in 1913 amounted to £3,554,392, as against £3,114,827 in 1912, an increase of £439,565, or 12.36 per cent, a large part of which must undoubtedly be due to an actual increase in premium rates charged rather than to any increase in total payroll insured, since 1913 was distinctly a year of depression and slackening trade, rather than one of great activity with its corresponding boom in numbers employed and wages paid.

Expenses of management show a marked falling off in 1913 both from the previous year and from the five year average of 1908 to 1912. The percentage of premiums consumed by the expenses of management was, in 1913, only 19.59, as compared with 21.46 in 1912 and 22.11 for the five years 1908-1912. The percentage of commissions paid to premiums earned appears to remain practically static, although here too a tendency toward reduction is to be noted. The percentages for 1913, 1912, and the five years 1908 to 1912 are, respectively, 13.51, 13.76 and 13.77.

American underwriters will be glad to see workmen's compensation insurance in Great Britain at last on an apparently sound foundation, with a margin on the right side of the balance sheet. It will not do, however, to lose sight of the long struggle, involving the reduction of expenses to absolute rock bottom and the constant increase of premium rates charged, before this happy consummation was accomplished. Even now the total underwriting profit on six years of hard work and risk incident to establishing a tremendous new branch of the insurance business in England is only 1.37 per cent of the total earned premiums of that period.

We give below what the "Post Magazine and Insurance Monitor" has to say of the results for 1913:

* * *

In our last annual review of the results of employers' liability insurance in the United Kingdom we had the qualified satisfaction of recording, for the first time since the Workmen's Compensation Act of 1906 came into force, the emergence of a perceptible profit from the volume of business regarded in the aggregate. This year it is gratifying to be able to point to a surplus from the operations of 1913 sufficient to wipe out the accumulated deficiency of the preceding five years and to encourage the hope that in future there will be some return to the companies less disproportionate to the risks assumed and the exacting work undertaken. * * * The approximate outcome for the whole period, 1908-13, with the separate totals for last year, is as given below:

	1913 £	1913 %	1908-13 £	1908-13 %
TARIFF COMPANIES.				
Claims	1,369,689	50.51	8,182,933	61.00
Commission	361,920	13.34	1,804,905	13.46
Expenses	561,408	20.70	2,906,146	21.66
	2,293,017	84.55	12,893,984	96.12
Profit	418,889	15.45	520,041	3.88
Earned premiums	2,711,906	100.00	13,414,025	100.00
NON-TARIFF COMPANIES.				
Claims	530,154	62.93	2,982,122	71.61
Commission	118,386	14 05	612,037	14.70
Expenses	134,781	16 00	849,300	20.39
	783,321	92.98	4,443,459	106.70
Profit	59,165	7.02	—279,213	—6.70
Earned premiums	842,486	100.00	4,164,246	100.00
TOTALS.				
Claims	1,899,843	53.45	11,165,055	63.52
Commission	480,306	13.51	2,416,942	13.75
Expenses	696,189	19.59	3,755,446	21.36
	3,076,338	86.55	17,337,443	98.63
Profit	478,054	13.45	240,828	1.37
Earned premiums	3,554,392	100.00	17,578,271	100.00

In comparing the results of the last two years the improvement in the claim ratio of the tariff offices is very noticeable and will be found distributed pretty generally throughout the offices. It has made possible a profit of 15.45 per cent on the annual premium income, in succession to one of 8.16 per cent, and a favorable margin of nearly 4 per cent on the premium income of the six years. It is evident that the associated offices have turned the corner, but it will not be safe to rely upon the ratio of profit being maintained, as the cost of claims is almost certain to increase. There is also the risk, invariably present when premium rates are temporarily on a profitable footing, that some companies will break away from the tariff and undercut in order to secure additional business, when the bad experience of the earlier years will be repeated. Hence the results of the past twelvemonth can only be

regarded as affording a respite, a breathing space before the struggle starts again. It is therefore satisfactory to note the tendency, especially observable among the tariff offices, to retain a substantial amount as a special reserve in addition to the provision for outstanding claims and unexpired risks. These extra reserves may quite possibly be needed, as some conservative companies are still suffering from the fact that reserves made a few years back have proved inadequate. Where profits are wisely kept in hand in the shape of additional reserves there will be a protection against the first shock of a rising claim ratio, and it is to be hoped that the experience will be so watched by the tariff association that, as soon as the business shows signs of again becoming unprofitable, rates may be raised without delay.

A very satisfactory improvement is also being exhibited by non-tariff offices, which have still, however, as a class, a large amount of loss to make good. Having only just succeeded in making ends meet in 1912, they disclose on the present occasion a profit margin of £59,165, or 7.02 per cent—an encouraging result, but to be viewed in relation to the fact that, whereas in the six years they have collected upwards of four mililons sterling in premiums, the business has shown a loss of over a quarter of a million.

Combining the tariff and non-tariff figures, the gain of £478,-054, which has rewarded the efforts of the past year (as against £202,591 in 1912) has sufficed to convert a prior loss of £237,226 for the five years into a profit of £240,828, or 1.37 per cent on the total earned premiums of £17,578,271. There lies probably before the offices a period of diminished income, due to falling trade consequent on the war. Some employers may be inclined to carry their own risk in the bad times which threaten, especially in those industries where the hazard is lightest and the business to the companies correspondingly profitable. The withdrawal of young and able-bodied men from many trades, caused by the vigorous recruiting which is going on, may tend to enhance the risk of insuring those left behind, as older and less active men will be employed in greater proportion than usual. Finally, the fact that the companies have begun to make a profit will excite pressure for a reduction of rates. This pressure should be firmly resisted, or the business may easily slip back into its former unsatisfactory condition, and a very short period of adversity will suffice to wipe out altogether the attentuated margin of 1.37 per cent, which is all the recompense that, according to the fairly close approximations we have made, the community has so far afforded the companies for their arduous labors in distributing equitably a heavy burden.

* * *

Analysis of Deaths by English Life Company.—Any statistics dealing with life assurance which will give a true insight into its science, says the "Review," of London, should be welcomed. The work of Dr. Byron Bramwell, chief medical officer of the Scottish Union and National Insurance Company, is warmly to be commended. He has published annually for eight years, an analysis of the deaths in his company. His report for 1913 is now before us. * * * Dr. Bramwell, in an explanatory note, says: "It must be remembered that an analysis of deaths only deals with one aspect of the subject: to make the investigation exhaustive and complete, the particulars of each proposal and the result of each proposal accepted by the company, whether terminating in death or not, would have to be analyzed. This, both from a medical and actuarial point of view, would be a very large undertaking; but it is hoped that the more limited investigation which has been attempted in this analysis may, more especially if it is carried on for a series of years, be of real and substantial value." We find that five great system are responsible for the majority of the deaths, viz., digestive, 17.98 per cent; circulatory, 17.71 per cent; nervous, 16.62 per cent; respiratory, 13.9 per cent; urinary, 10.08 per cent. Curiously enough, senility comes next, and this has been consistent throughout the years of investigation.

* * *

Part IV of New York Insurance Report.—Superintendent Hasbrouck has issued Part IV of the annual report of the New York State Insurance Department covering financial returns of the Fraternal Beneficiary Orders or Societies, Co-operative Town and County Fire Insurance Companies and Assessment Life and Accident Insurance Associations for the year 1913. The statistical tables and abstracts printed in this volume are based upon the department audit of the annual statements of the various companies and associations included therein. It also includes detailed statements for that year of the above classes of insurance organizations now being liquidated by the department under the provisions of section 63 of the insurance law.

A general summary of the report is shown by the following comparison of the results of the business of 1912 and 1913:

FRATERNAL BENEFICIARY ORDERS.

	1913.	Increase.
Assets	$132,961,600	$11,437,228
Liabilities	17,464,151	1,119,341
Received from members	81,103,039	731,721
Total income	83,790,347	2,144,858
Claims paid	65,721,192	1,620,847
Total disbursements	76,731,995	2,304,548
Total insurance in force	6,200,034,879	37,044,327
Insurance in force in New York State	612,343,794	*835,433

*Decrease.

In conenction with the above stated "liabilities" of fraternal orders, attention is called to the fact that at the present time fraternal orders carry no statutory policy reserve, which accounts for the large excess of "assets" over "liabilities."

CO-OPERATIVE FIRE CORPORATIONS.

	1913.	Increase.
Assets	$1,057,587	$18,527
Liabilities	932,577	43,875
Received from members	1,830,889	*28,150
Total income	2,231,552	*11,069
Claims paid	1,356,347	26,161
Total disbursements	2,218,181	40,640
Total insurance in force (all in New York)	522,272,775	11,229,831

ASSESSMENT LIFE AND ACCIDENT ASSOCIATIONS.

Assets	$3,787,170	$95,077
Liabilities	2,078,093	*10,647
Received from members	2,665,619	13,830
Total income	2,949,123	*87,220
Claims paid	2,050,753	*184,669
Total disbursements	2,583,204	*136,753
Total insurance in force	92,161,038	382,655
Insurance in force in New York State	60,904,838	*621,356

*Decrease.

The issue of Part IV closes the department report covering the financial operations and condition, as shown by the audited annual returns, of each of the various classes of insurance corporations reporting to it, of which there are more than 650.

Part V. The miscellaneous volume of the report, now being printed, will contain abtracts of all reports of examinations of companies made by the department during the year ending July 1, 1914, Court of Appeals' decisions, Attorney General's opinions, rulings of the Superintendent of Insurance, amendments of 1914 to the insurance law, circular of fees and taxes charged insurance corporations by the various States, and other matters of general interest to the insuring public.

INSURANCE NEWS IN THE WEST

Prospects for Northwest Fire Underwriters' Meeting.—Next week comes the Northwest meeting, the big event of the year in

Western fire insurance circles. In years past it has been the custom of Western managers to invite their field men into Chicago at this time, and some of them have made the week of the meeting the occasion of a general round-up. For several years past, there have been certain managers who did not instruct their field men to come in, but rather gave them to understand that it would be more agreeable to the management if they continued at work. This year the number of those who did not write to the field men about the Northwest meeting is said to be larger than usual. Managers are not to be censured for considering the time and expense of attending these meetings. In the old days the Fire Underwriters' Association of the Northwest was the big one among a comparatively few organizations. Now nearly every State has its fire prevention association or a field organization, or both, to say nothing of the ponds of the Blue Goose, and the number of days in each year that the field man who is active in organizations gives to them is really quite large. While the Northwest Association still has its educational value, agencies of this character have multiplied to such an extent that it no longer holds the distinctive position in this respect that it once did.

It is forecast that B. L. West, assistant Western manager of the Insurance Company of North America, will be elected president of the Northwest Association. His chief competitor for the honor is W. A. Blodgett, vice-president of the American Central. Both are fine men, but Mr. Blodgett appears to have turned some votes away from himself through a reference to the "T. & T. Club" in an address he delivered before the association several years ago. While the reference was facetious, this implied accusation of getting out on Tuesday and coming home in Thursday and calilng it a week's work, seems to have struck some of the field men where they are sensitive. The refernce has been mentioned during the campaign now closing.

* * *

War Clouds in Western Automobile Circles.—Troubles in the automobile insurance business in the West, which have continued for some time, appear about to come to a head. Whether the result will be war or peace the next two weeks are likely to determine. Half a dozen companies or more, which are not members of either automobile conference, have been issuing fire floaters at a rate lower than that charged by the conference companies for marine floaters. The marine coverage is so much broader that it certainly is entitled to a higher rate. However, there are many owners of cars who do not want to pay for being covered against perils of transportation and other hazards which the marine form covers. Large numbers of these have been buying the cheaper fire floaters and the conference companies have seen much business getting away from them, especially business on new cars. The Eastern Automobile Conference has shown no inclination to ignore this competition, but the Western Conference has at last reached almost the end of its patience, and a few days ago it received the approval of the Eastern Conference to open rates on October 15, unless an understanding can be reached with the outsiders. A meeting has been called for the latter part of this week, at which a committee will be appointed to visit the Western managers of these companies and make at least one more effort to settle the differences by pacific methods.

* * *

More Signs of the Federation Movement.—W. S. Diggs, of Cincinnati, president of the Insurance Federation of Ohio, stated last week that he had received invitations to visit nine different States and participate in the organization of federations. He did not expct to accept them, however, as he cannot afford the time, and it is expected that the manager of the National Association of Casualty and Surety Agents will take up this work. The manager has not been appointed yet, but there apepars no doubt that the executive committee will carry out the expressed wish of the association and name one as soon as provision has been made for financing the office for a sufficient time to justify the right kind of a man in accepting it.

* * *

Superintendent Small on Agents' Licenses in Ohio.—Superintendent R. M. Small, of Ohio, has just issued his annual report. In it he makes a number of recommendations for new laws or amendment of present ones which would give the Superintendent much greater power in dealing with agents. The Ohio law, like that of many other States, provides only for the licensing of agents of foreign companies. The result is that if any agent of such a company loses his license for disreputable practices, he can promptly make a connection with an Ohio company, if one will atke him, and snap his fingers at the Superintendent. In order to get their agents under State supervision, Mr. Small would have the law changed to require the Ohio companies to secure licenses for their agents also. In addition he asks for an agents' qualifications act and for more authority to cancel licenses.

After his report was in print a case came up which illustrated the need of just such laws as he recommends. The casualty department of the National Life, U. S. A., filed complaint with him that its former salaried district manager at Akron, after resigning, had undertaken the systematic twisting of its business to the Columbus Mutual Life, with which he had become connected. Mr. Small had a hearing on the case on Monday and from the remarks he is reported to have made, it appears that he considered the charge fully substantiated. However, he could do nothing more than appeal to the Columbus Mutual to discharge the agent, or threaten to make trouble when it seeks its renewal of license next year, if it refuses to accede to his request. A man who recently visited Mr. Small's office, says he has a stack of complaints against industrial accident agents, and that a large part of his time is taken up in investigating them.

* * *

The Compensation Rate Situation in the West.—The new workmen's compensation rates for Illinois have created quite a stir in Chicago. Some of the agents are not pleased with them by any means. They are lower in certain cases than local experience seems to justify. Furthermore, the reductions on certain classifications cause the assured to feel that they have been greatly overcharged in the past. At least that is what they claim as the reason for turning the cold shoulder on brokers. These rates are computed by the new system, the basis being secured on experience and then modified by the State differential worked out by the actuarial committee of the Workmen's Compensation Service Bureau. It is to be expected that they will not be subject to the great fluctuations that have occurred in the past.

In Michigan, where new rates also have been promulgated, mutuals are reported to be endeavoring to make capital out of the reductions, claiming that the stock companies charged too much until they were "found out" and then reduced the rates. It does not appear, however, that this attack is having much effect, as Michigan employers, aside from a comparatively few large ones, have not shown much friendliness to mutuals.

In Minnesota there is complaint because the new rates, which it is known are coming, have not appeared as soon as they did in some of the neighboring States.

La Salle.

Chicago, October 2, 1914.

FINANCE AND COMMERCE

Financial and Commercial Review.
Banking Situation at Home and Abroad.
Statistics of Cotton and Coffee.
Market Prices of Securities and Commodities.

TWO months after the outbreak of the general European War what are the conditions which bankers and business men find? The answer has to be made up of a mass of facts and considerations taken in detail, but the general conclusion which forces itself is that the American economic position is to-day much better than might have been expected.

How much improvement there has been in the international money market is conjectural. That there has been some is proved by the sharp recovery in our export trade in the latter part of September. This recovery would not have been possible unless monetary conditions permitted the outward movement of goods and commodities to be satisfactorily financed with cash payment on the nail to American shippers who could not afford to take a chance with the buying power of foreign markets. The whole problem of international finance is complicated by our huge capital debt represented in the vast European holdings of American securities, but up to a certain point the international money market can become very favorable to us without regard to the question of the securities market, and if it does become so favorable the question of meeting European liquidation of American securities will be less troublesome to solve.

Just now we are engaged in trying to discharge our actual balance of indebtedness on current account. There is a rough agreement of all estimates that we owe something like a half billion dollars abroad which is due and payable in or through London, but the indications are that settlement of this debt will be rapidly effected. Although our inward and outward foreign trade will be a shrunken aggregate for a long time to come, there is certainly a widening gap between imports and exports in favor of the export trade and trade bills are supplying exchange which is going to help materially in discharging our foreign obligations. Quite apart from that the country is giving through its bankers unmistakable evidence of its purpose and ability to use gold to any reasonable extent in meeting foreign obligations.

After something like $130,000,000 gold had been exported from the United States from the beginning of the year to the early part of August, New York bankers arranged to ship $80,000,000 gold if necessary in the New York City loan operation, and the success of the country-wide banking subscription to the $100,000,000 gold fund was this week assured. Here, in all conscience, is a sufficient surrender of gold in one year to encourage European finance, especially British finance, to do its utmost to restore the customary processes of the international money market to an extent which would enable the American banking and business community to maintain solvency by providing for it the credit instruments through which international transactions in goods and securities are ordinarily conducted.

Furthermore, the portents of the London money market are such as to suggest that with the encouragement given to foreign confidence in our position, it will not be long before London will be forcing credits upon us for employment. Funds promise to become a drug in London, thanks to the adoption of numerous emergency measures conducive to a present plethora of money whatever the developments of the future may be, and the high going rates of interest here compared with the falling price of money in London must suggest to foreign lenders the existence of an excellent American opportunity for the profitable use of credit. So far foreign exchange quotations have not been significant of anything more than the dreadful shock which the war has administered to the whole financial structure of civilization. Rates continue unprecedentedly high, and such fluctuations as have taken place recently around $5 for sterling have not denoted any distinct trend. It may be that developments in the war are a necessary precedent to any distinct change in the character of the international money market, but it would seem that in time anyway our sacrifice of gold, that is of the reserve basis of credits which could be used to great advantage in domestic trade, must, together with our merchandise and commodity exports, give us a foreign credit balance.

It is a hopeful indication that there is more adequate appreciation of what our foreign trade opportunities consist in. To increase external commerce permanently, however, the American merchant, the American manufacturer and the American banker have got to go in for economic fitness and achieve competitive ability to a degree that has not been exemplified in our past. It is a question, also, if American finance has not neglected too much the opportunity which the war has offered to established dollar exchange as a medium for international payments and it might not be a bad thing if British finances should fail to see the desirability of making less strain on our resources than that to which they have been subjected. If we should be thrown back on our own resources, if national defense of our neutrality compels us to become aggressive, American ingenuity and enterprise may be entirely adequate to setting up the United States as banker for the world.

Still, it might be pointed out in this connection that while our eyes are opening to many new facts there are rampant delusions which interfere with perfect vision. Of such is the campaign for the exclusive purchase of "made in America" goods. This is all right so far as it means the encouragement of commerce and industry to supply those articles and staples of which the war has deprived us. It is all right also as a discourager of extravagant importations at a time when it is most desirable to build up a trade credit balance. It is all wrong if it conduces to any check on purchases abroad which will stimulate in turn the foreign consumption of goods "made in America."

Until the foreign exchanges become more comfortable it is not to be supposed that the domestic money market will manifest relaxation unless unwise efforts are made to inflate the supply of funds. The comparative stringency of the home money market is a protection against the tug which other countries are making through the foreign exchanges at our bank reserve basis of credit. For this reason it is somewhat disturbing that the Secretary of the Treasury has evinced the survival of some of those notions which threatened to make trouble last year when currency legislation was pending. Mr. McAdoo acted within his duties in directing attention to the excessive accumulation of reserves by some banks, but the good which his utterances might have done in promoting a recognition of the sound principles of banking in a time of strain and the impulse which he might have given to a freer proffer of accommodation was more than counterbalanced by his pretences to regulate the rate of interest and the recklessness with which he endorsed hallucinations about the relations of currency to credit as well as by the irresponsibility which he displayed in catering to the unpopular prejudice against money lenders.

It is rather distressing to find that the finance minister of the Government believes that bankers can charge more for money than it is worth. Nevertheless, Mr. McAdoo has probably learned another lesson in discovering that his assault on the New York banks for charging too high lending rates was without merit and his

fresh exploit in interference with the money market may not be without its useful consequences after all. Meanwhile, by naming the Class C directors the Federal Reserve Board has paved the way for an early organization of the Federal Reserve Banks and the inauguration of the new banking system will help us to mobilize our financial facilities far more effectively for all requirements than has been possible under the old banking system with its higher reserve percentages, its scattered reserve holdings, its utter lack of any real rediscount machinery and its sanction for accommodation paper instead of real commercial bills.

Rates for loans in this country to-day might be quoted at a 7 per cent minimum. The terms which are being arranged for public borrowings, as by municipalities and corporations, together with the prices made for short term notes in the investment market all tend to establish this as the basic level for operations in credit. It goes without saying that such a price for money is not conducive to expansive business activity and represents necessity rather than opportunity. Much of the stringency of the money market results from the suspension of regular business in securities for which the restricted dealings for cash that are now permitted are not a substitute from the standpoint of the banker whose assets are locked up in call and in time loans on collateral security and in investments therein.

As yet there is no evidence that Stock Exchange reopening is at all imminent and the reopening of the cotton exchanges, which would make a contribution of relief to the banking situation, is still a matter of the future. Efforts to do something for cotton have not yielded anything substantial and it begins to look as though the South would have to absorb a heavy loss on its staple with only a moderate amount of outside help, but even in this regard much depends on nearby events which may cause relaxation in foreign exchange and an increase in foreign trade. It is not open to dispute that cotton next year will be worth much more than it is bringing at forced sale now, and if purchases could be financed spinners everywhere would probably hasten to protect themselves against a future shortage of cotton supply. So far as concerns other agricultural commodities nothing but higher prices are in sight, although for the moment banking restrictions impede the speculative undertakings which would discount advances. Agricultural convictions as to the outlook are manifested in the large increase of Winter wheat acreage which is reported.

COTTON

October 3, 1914.

ALTHOUGH the cotton situation has the appearance, on its face, of remaining essentially unchanged, both in respect of those difficulties of the trade which still keep the cotton exchanges closed and also in respect of the anxieties of the cotton producers and those dependent upon the financial results obtained by them from their crop, there have been certain indications within the past week that the resumption of regular business is not so very far off. There is always danger of premature optimism in such a matter and it is easy to be misled by signs that later prove to have had no significance; but, on the other hand, it is the greatest of mistakes to pay no heed to the first faint evidences of the renewed operation of those underlying forces which in the long run will without a shadow of a doubt have their way in restoring the world's commerce in one of the chief necessities of life to its regular course. During the weary weeks through which the cotton trade has been passing, it has been somewhat too easy for many whose livelihood depends upon cotton to fall into the error of supposing that things can go on indefinitely as they have been since the outbreak of the European War. Unable to see clearly how the disturbed processes of finance and trade could be re-established and, if necessary, readjusted to the existing conditions, dealers in cotton who have suffered many losses and have become as a result inclined to despondency, have lost the art of discerning in the present the seeds of the future. The old formulas, immediate offspring of the cataclysm of war, occupy the minds of such, and they forget that after all the human race, with its needs, is infinitely greater than any nation or even group of nations. Interrupted though commerce be between the different parts of the globe, the population of the earth will be clothed, and clothed with cotton. Even war itself cannot prevent this nor long interfere with it. Even the belligerent countries cannot long hold off so imperative a necessity as this for themselves. It is obviously the case that not for a century have we had a war so completely involving the countries in which a great part of the world's industrial and financial initiative manifests itself; but commerce, as we know it, is mightier than armies and will be blocked only for a brief space of time by the exigencies of nations at war. Its courses cannot, to be sure, be changed in an instant, but from the moment of stoppage they begin to change; and almost before men know it, they are found to run not against but around the obstacles in their way. It may be, for example, that Germany and Austria will this year be isolated and hence unable to buy cotton or to spin it. Such consumption of the products of cotton as the populations of these countries normally show may be considerably diminished. But somewhere and somehow the cotton that these countries have hitherto been spinning will be spun again this year, and the products of it will be distributed to the markets that require them. Nor will this be long prevented by the disarrangement of international finance; in that field, too, the seemingly insuperable difficulties will be overcome and a way will be found for the manufacturer of cotton to get money for his products, wherever he may sell them. There is no industry, except the production of food, that is so hard to cripple and permanently restrict as is the cotton industry. No better illustration of this could be found than the fact that, according to the best information, the cotton mills of Lille and Roubaix, in France, of Mulhausen, in Alsace, and of the Western provinces of Belgium, are actually in operation at the present moment, despite the fact that they are actually within the fighting zone. But for the military usurpation of the railways, making it almost impossible to get cotton in or goods out, these mills would at this very time be running as fully as the available labor would permit. But these are, after all, not the particular hopeful indications referred to above. Chief among these may be put a returning confidence that the worst is over on the part of those most closely in touch with the manufacturing industry both in the United States and in England. The American spinners have been deeply discouraged until recently by reason of having on hand a large amount of high-priced cotton and of goods made from such cotton. The immediate reduction of their selling basis for goods would mean the loss to them of many millions of dollars; yet the distributors of goods have been insisting that the spinners must bear this loss in its entirety and sell their product on the new low basis for cotton. This meant trouble now and still greater trouble hereafter; for the spinners know that cotton cannot long sell cents per pound below its economic cost of production and yet that it is a long and expensive task to restore the prices of goods once marked down. But now that is happening which may give the spinners, rather than the greedy distributors, the better end of it; for large, indeed immense, orders are reaching us from foreign governments, particularly England and France, for blankets and other goods required for armies engaged in a Winter campaign. There can be no doubt that such mills in those countries as are equipped to make such goods already have their fill of orders, and yet the overflow to us is enough to remove some of our largest mills from the competition of the domestic market. From other directions also, as from the West made prosperous by the high prices obtained for its foodstuffs, our mills are beginning to receive abundant offers, giving them courage to demand sufficiently high prices for their goods. Other things become less formidable, when it is seen that the world's demand for cotton goods will no longer be stayed.

THE CONTRACT MARKETS

THE NEW YORK COTTON EXCHANGE.

The following were the high, low and closing bid prices for each delivery, on Friday, July 31, in cents and hundredths of a cent per pound, gross weight:

The MOVEMENT OF THE AMERICAN CROP.

The American crop year has been changed to run from August 1 to July 31, and all comparisons are made up accordingly.

The following tables, derived from the New York Cotton Exchange, show the movement of the American cotton crop for the past week and since August 1, 1914, with comparisons for previous years:

CROP MOVEMENT INTO SIGHT.

Weekly Movement.	1911-12.	1912-13.	1913-14.	1914-15.
Port receipts	447,659	450,344	424,947	160,192
Overland to mills and Canada	7,350	5,084	8,465	3,299
So mill takings, est., exclusive of takings from Southern ports.	75,000	75,000	75,000	45,000
Gain of stocks at interior towns	70,852	31,591	60,442	75,671
Brought into sight for week	600,861	562,019	568,854	284,162
Total Movement—				
Port receipts	1,919,758	1,651,041	1,752,513	450,567
Overland to mills and Canada	26,348	22,256	38,966	11,700
Southern mill takings	317,032	290,873	329,796	123,000
Stocks at interior towns in excess of Sept. 1	217,038	143,532	123,511	193,028

GOVERNMENT REPORT ON CONDITION OF THE COTTON CROP OF SEPTEMBER 25, 1914.

The Crop Reporting Board of the Bureau of Crop Estimates of the United States Department of Agriculture, has issued its monthly report on the condition of the cotton crop, estimating from the reports of the correspondents and agents of the Bureau, that the condition on September 25 was 73.5 per cent of a normal, as compared with 78.0 on August 25, 1914; 64.1 on September 25, 1913; 69.6 on September 25, 1912, and 68.5, the average on September 25 of the past ten years.

Comparisons of conditions, by States, follow:

	Sept. 25, 1914.	Aug. 25, 1914.	Sept. 25 1913.	Sept. 25 1912.	Sept. 25 Ten-Year Average.

SECOND REPORT OF SEASON OF COTTON GINNING.

At 10 a. m on October 2 the Bureau of the Census published the report of cotton ginned prior to September 25, 1914. There were ginned up to then 3,381,863 bales as compared with 3,246,655 last year and 3,007,271 in 1912. Particulars, by States, follow:

GINNED TO SEPTEMBER 25.

	1914.	1913.	1912.
Alabama	392,655	325,735	192,310
Arkansas	99,179	70,086	41,438
Arkansas	25,388	16,367	9,770
Georgia	769,118	491,511	272,335
Louisiana	94,175	77,865	73,992
Mississippi	161,125	120,593	57,393
North Carolina	82,849	49,952	101,683
Oklahoma	109,050	148,979	77,394
South Carolina	238,589	193,318	174,251
Tennessee	16,033	18,359	990
Texas	1,324,778	1,727,639	2,002,975
Other States	8,924	6,251	2,740
United States	3,381,863	3,246,655	3,007,271

Included in this year's ginning were 3,292 round bales, as compared with 26,983 last year and 19,574 in 1912. Of Sea Island there were included this year 13,895 bales, as compared with 10,570 last year and 3,051 in 1912.

* * *

The Causes of the Decline in the Production of Sea Island Cotton.—The United States Department of Agriculture has just issued a bulletin stating that co-operation between spinners and growers is essential if the Sea Island cotton growing industry is to be replaced on a profitable basis. In recent years the growing of Sea Island cotton has not been profitable, and under existing conditions it is hardly likely that it will be. It is highly desirable, however, both for the farmer and for the spinner, that this long-staple cotton should continue to be raised without any deterioration in its quality. The Department of Agriculture has just completed a study of the market and economic conditions in the Sea Island cotton industry, the results of which will appear in the forthcoming bulletin entitled "Economic Conditions in the Sea Island Cotton Industry." This inquiry was prompted primarily by the fact that although the crop of 1912 to 1913 was approximately only three-fifths of that of the preceding year, the prices were lower and a much larger stock was carried over.

For this condition of affairs the investigators found four causes primarily responsible:

1. A deadlock in the market; growers holding the cotton for higher prices than spinners were willing to pay.

2. The successful competition against Sea Island cotton of the new Egyptian variety known as Sakellaridis.

(Continued on Next Page.)

NEW YORK QUOTATIONS FOR STANDARD COTTON GOODS AND YARNS

The following are quoted prices in the New York market for typical standard cotton goods (in cents per yard) and cotton yarns (in cents per pound) on Saturday of last week and on Wednesday of the present week:

Cloths.	Saturday.	Wednesday.
Print cloths, 28 in. 64 x 64s	3 5/8	3 5/8
Gray goods, 38 in., standard	4 1/4	4 1/4
Brown sheetings, Southern standard	7 1/2	7 1/2
Denims, 9-ounce	12 1/2-17	12 1/2-17
Ticklings, 8-ounce	13	13
Standard prints	7 1/4	7 1/4
Standard staple ginghams	6 1/4	6 1/4
Yarns.		
Southern 2-ply skeins, 30s	20 1/2-21	20 1/2-21
Southern 2-ply skeins, 60s	37 1/2-41	37 1/2-41
Southern single skeins, 20s	18	18
Southern single chain warps, 20s	18	18
Southern 2-ply chain warps, 20s	18-18 1/2	18 1/2-19
Southern frame cones, 20s	18-18 1/2	18-18 1/2
Southern frame cones, 30s	21-22	21-22
Eastern carded cops, 20s	20 1/2	20 1/2
Eastern carded cops, 30s	24 1/4	24 1/4
Eastern carded peeler warps, 30s	27	27
Eastern carded peeler warps, 60s	44	44

3. Deterioration in the quality of Sea Island cotton due to the difficulty of obtaining proper seed.

4. Changes in fashion which have resulted in an increased demand for coarser goods and a diminution in the consumption of the longest and finest cottons.

THE CONSERVATION OF COTTON AS A NATIONAL ASSET

By Hon. W. P. G. Harding*
Member of the Federal Reserve Board

THE cotton industry is perhaps as seriously affected by the European War as any other, and this statement applies with equal force to all connected with it,—the producers of raw cotton, the manufacturers and the distributors of cotton goods. The opportunity for expansion of our textile trade which is anticipated as an aftermath of the war, while undoubtedly a potentiality, does not as yet appear to exist to any appreciable degree. The titanic struggle between the great powers of Europe has disarranged credits, and has disturbed the exchange of commodities throughout the world; and while cotton is classed as a staple crop, and goods manufactured from it are necessities, they are not as supremely and immediately necessary as foodstuffs. Because of this fact the first effect of a great war is to advance the price of grain and to depress that of cotton. Yet the economic law of supply and demand, while apparently suspended at times, is never abrogated and always in the end reasserts itself. When a dam or other obstruction is thrown across a stream the flow below it is reduced until the water impounded flows over the top, when the normal volume is restored; and if the obstruction be removed the flow becomes abnormally large. At the present juncture, the war is operating as an obstruction to the normal current of the cotton trade. Sooner or later, however, even should the war continue, the level of the obstruction will be reached and the flow of business, except in some of the countries actually engaged in war, will again become normal. Restoration of peace would act as a removal of obstruction and would release a large volume of business now being held back, so that we are justified, if we look ahead, in taking a more cheerful view of conditions which appear at this time to be depressing. Cotton goods are the cheapest of all textiles and should replace during hard times finer and more expensive fabrics. Cotton can be used in considerable quantities as a substitute for jute and other materials in the manufacture of burlaps and nacks; mills in England are reported as running double time on khaki for army uniforms, and there is no reason to doubt that the trade will ultimately absorb the world's production. Cotton manufacturers must solve the problems which have grown out of the closing of the cotton exchanges of this country, whereby they have been deprived of a standardized price and of their power to hedge on contracts, and must overcome the further difficulty, occasioned by loss of confidence and curtailment of credits, of financing purchases. Compared with the prices that have obtained for the past three or four seasons, present quotations seem very low, but it is doubtful if large stocks of cotton could be secured at prevailing prices, as an active buying movement would undoubtedly enhance values. It is argued that the Southern States have produced a cotton crop, which added to that grown in other countries, is under present conditions about 5,000,000 bales greater than is required for the world's needs; and the fear that this is true is causing much apprehension in the South. There have been predictions of general bankruptcy and ruin; and yet, regardless of all the pessimistic talk and in spite of increasing receipts, the price has advanced during the last three weeks 1½ to 2 cents per pound; and it is well worth while for cotton manufacturers to consider these facts, to analyze them carefully, and to anticipate the probable effects. The cause is not hard to find. For many years the South has been gaining in wealth and its farmers have been growing more independent, better methods of agriculture have been introduced, marked progress has been made in the diversification of crops, large plantations have been sub-divided into small farms, and in many cases the tenant farmer has become his own landlord. There is in every normal year a certain proportion of the crop which comes in early and which seeks the market at any level that it can find, which is commonly called "distressed cotton." This is the cotton that is now being sold at 7½ to 8 cents, and it would be well for manufacturers to bear in mind that at these figures much cotton will be withheld from the market for months to come. It is true that there is a great amount of indebtedness which can be liquidated only by the sale of cotton, but in view of the increased cost of production in recent years, sales at present prices would be in many cases inadequate for the discharge of these obligations, so that even if the producer, being unable to sell his cotton for enough to pay his indebtedness, should turn it over to his creditor, many of these creditors would be in a position to hold, and much of the cotton will be withheld from the actual market.

The financing of the present crop began with its planting last March and April. It is the one crop in the South on which loans are always freely made until it is harvested, and investigations recently made by chambers of commerce in Southern States show that advances on cotton in different States, made from the time of the planting of the crop until it left the gins, range from $30 to $44 per bale. The last four crops, including seed, have brought the people of the Southern States a gross average of nearly one thousand million dollars per year, of which amount about one-half has come from domestic and Canadian mills, and the remainder represents the value of exports to foreign countries. By the sale of this crop the South has been enabled not only to discharge its obligations promptly every Fall, but has added half a billion dollars each year to the National trade balance. Cotton production is stimulated by high prices, and conversely it is curtailed when prices fall below the cost of production. This has been particularly true in those years when prices were low throughout the season and continued low during planting time in the early Spring. Never have the evils of over-production been so universally appreciated in the South as now, nor ever before has there been such grim determination to hold cotton and to radically curtail acreage. Public sentiment in many Southern States has been so aroused that there is now a general clamor for legislation by the States to regulate the production of cotton, and some farmers have gone so far as to demand that the planting of any cotton whatever in 1915 be prohibited. Of course, extreme action of this kind is not anticipated, but it is undoubtedly true that should prices considerably below the average cost of production, which is probably about 10 cents per pound, prevail for the next six months, cotton will be parted with only as necessity arises, and most serious curtailment in acreage for the next crop will be the inevitable sequence. Many of those who might be financially able to put their lands in cotton would be attracted by the high prices for grain and would plant food crops, while others less independent might be willing to continue in cotton, but would find themselves unable to secure the necessary advances. No man well informed on Southern conditions will deny that further diversification in Southern farming is desirable, and that more attention should be paid to cattle raising and to the production of

*An address delivered at the semi-annual meeting of The National Association of Cotton Manufacturers, at Lenox, Mass., on Wednesday, September 30, 1914.

foodstuffs. But it would be most unfortunate if, by any chance, the production of cotton next year should be so small as to make the trade dependent upon the present crop for the greater portion of two years' supply. Cotton goods can compete with more expensive fabrics only up to a certain price level, and if a year hence the prevailing prices for raw cotton should be as abnormally high as they are now abnormally low, the manufacturers of cotton goods would have their present problems aggravated, and would be fatally handicapped in a movement for trade expansion at the very time when it is probable that conditions would be ripe for efforts in that direction. I shall not undertake in the presence of the foremost experts to hazard any guesses as to the probable consumption of cotton within the next few months, but I will be bold enough to predict that as the season progresses there will be a steadily increasing demand for raw cotton by the mills, with a marked increase in the demand for export. Of course, as long as present conditions continue the demand from Germany, Austria-Hungary, Belgium and France will be greatly curtailed, but there should be a good demand from Great Britain, Spain, Italy and from Russia, which can obtain its supplies independently of routings through the Baltic Sea. Ship room is now available, prompt action by Congress has enabled our Government to provide marine insurance, the Bank of England is again discounting bills and practically all obstacles in the way of exports to all foreign countries, except Germany and Austria-Hungary, have been removed. Foreign exchange conditions have within the last few days been vastly improved by the formation of the gold fund as approved by the Secretary of the Treasury and the Federal Reserve Board, and as our exports of grain and cotton increase in volume, as they must do in the very near future, normal quotations for sterling bills will again prevail. I am violating no confidence when I state that rapid progress is now being made in the organization of the Federal Reserve Banks, and it is my personal opinion that the system will become effective during the ensuing month. The Secretary of the Treasury has acted with wonderful celerity throughout the crisis, and by his promptness in authorizing and issuing emergency currency under the provisions of the Aldrich-Vreeland Act as amended, has, in the face of moratoria in practically nearly all other civilized countries, kept the United States not only upon a cash basis, but upon a gold basis, and he asks only the intelligent and unselfish co-operation of the business community, which he confidently expects, to aid him in the speedy restoration of normal financial and commercial conditions throughout this country. The tremendous waste incident to war, will, of course, be felt all over the world, and losses will inevitably ensue, but there is no reason, as far as this country is concerned, why those losses should not be so uniformly distributed that they will not fall with crushing force upon any section, or upon any industry; and I firmly believe that American pluck and American energy are going to reassert themselves, and that American farmers, merchants, bankers and manufacturers will co-operate with their government, and with each other, in solving present problems, and that they will put themselves in a position to grasp the opportunities that the future is bound to offer.

THE COTTON SITUATION IN THE UNITED STATES FROM THE POINT OF VIEW OF THE COTTON TRADE

By Arthur R. Marsh*

THE present European War has revealed with painful clearness an economic fact of which only a few, even among eminent authorities upon industry, commerce and finance, have hitherto had more than a vague conception, and of which the generality of men of affairs have had no knowledge at all. This fact is that the international subdivision of productive industry, made possible by the fluidity of international credits, has now gone so far and has specialized the productive functions of so large a portion of the human race, that the mere temporary stoppage of the free flow of these credits instantly affects every country on the globe, disarranges the internal as well as external economy of every country, and produces the severest hardships for a large proportion of the population of each. No country in the world is now sufficient unto itself alone. All are dependent for the economic welfare of their population at home upon the undisturbed operation of the machinery of their commercial and financial intercourse, direct and indirect, with all other nations. Above all are they dependent upon that portion of this machinery which at first sight might seem to be not the reality, but the reflection of the reality of their commerce one with another,—the organized and continuous functioning of the world credit system which to-day makes possible the balancing, clearing and liquidation of their multitudinous interexchanges of the commodities which are, of course, the realities of all commerce. It has become in our time virtually impossible for countries to exchange goods for goods directly. The United States has cotton to sell and wool to buy; Australia has wool to sell and cotton (in form of goods) to buy; yet the modern world affords no direct means at all for an interchange of the cotton of the United States for the wool of Australia. Only by the use of international credits,—and these of a decidedly complicated kind,—can the interchange be effected. And if, for any reason, the system of international credits is blocked or interrupted, the United States cannot sell her cotton and Australia cannot sell her wool.

This is precisely the situation to-day all over the world; but it is most marked in respect of those countries which have come to rely upon the sale in international commerce of one or two great commodities for the annual balancing of their accounts with other countries. A few of the countries of Europe,—notably England and France,—in which the century-long accumulation of capital, largely invested in other countries, has produced an annual balance of account against the rest of the world,—are spared in part the embarrassment of being unable to meet their international indebtedness, because they canont find a market for some pre-eminent commodity they produce. But all the countries which, in an economic sense, are new and still in the stage of self-development with borrowed money, are to-day unable to meet their international obligations, because the breakdown of international credits has deprived them of a ready market for their great debt-paying commodities. More than this, the effect of this condition of things in the domestic markets in which these commodities are first sold in each country is a tremendous depreciation of their price, threatened ruin for the immediate producers of them, and a spread of this ruin to other portions of the home population which stand in credit relations with these producers, cannot get their money from them, and hence cannot meet their own obligations in other directions. Thus the disease runs through all parts of the economic society of each such country, and all trade and industry suffer.

At the present moment there is no market at all for wool in Australia and New Zealand, and a true economic crisis in those countries is the result. There is no market in India for tea, cotton and jute. In Japan there is virtually no market for silk. Per-

* An address delivered at the semi-annual meeting of The National Association of Cotton Manufacturers, at Lenox, Mass., on Wednesday, September 30, 1914.

sia and Asia Minor cannot sell their rugs and carpets, their figs and dates. Greece cannot sell her currants and wines. Italy cannot sell her silks, marbles, wines and olive oil. Spain has no market for her copper, her cork-wood, or her wines. Brazil is in desperation with her coffee, and cannot ship her rubber. Chile can find no buyers for her nitrates; nor Peru for her guano and her cotton. Despite the fact that foodstuffs among the great commodities are so indispensable to nations at war that money is found somehow for their purchase, even at the expense of all other necessities, it is reported that there is virtually no market for corn in Argentina, and that the beef, mutton and wool produced there are in hardly better case.

While we in this country are not remotely, but directly concerned with the commercial and financial difficulties of all the countries just named, in respect of the commodities which they have produced in response to our own demand as well as that of the rest of the world, but which they now can find no way to market, our chief thought is naturally given to that commodity of our own, which means so much to us in our international commercial and financial relations,—I mean, of course, cotton. We have produced this season such a crop of cotton as the world would normally require and would normally pay us for at a price somewhat above the cost of production. We have usually consumed at home not far from forty per cent of the cotton we raise, and it is probable that by the end of this crop year American manufacturers will be found to have spun up fully this percentage of the present crop. But sixty per cent of our cotton production is for foreign consumption; we raise this portion of every crop to be sold in international trade; we rely upon the amount realized from it as the chief single factor in balancing our accounts with the rest of the world; and our cotton producers form so considerable a part of our population that, if they receive an insufficient return from the sale of what they have raised, they will be unable to meet their already incurred obligations and will cause a similar disability all the way up the line of those dealing with them directly or indirectly, until even our metropolitan banks are subjected to strain, on the one hand, and, on the other hand, industrialists of every kind, including our cotton manufacturers, will have curtailed markets for their products. It is the idlest of idle talk, then, to assert that the problem of marketing the present cotton crop is one concerning only the producers of cotton; that they must submit to the operation of the inexorable law of supply and demand; and that the other departments of our national production will suffer no harm, and, in the case of cotton manufacturers, may even be benefitted, if the cotton producers are left to shift for themselves. On the contrary, the opposite of all this is true, not only of cotton in the United States, but of all those great commodities produced in other countries mainly for international commerce. The wool growers of Australia cannot be left to take care of themselves in a time like this; nor can the cotton growers of India and Egypt. The nitrate producers of Chile, the tea and jute producers of India, the coffee and rubber producers of Brazil, the corn and cattle producers of Argentina, the currant growers of Greece, all occupy a place in the economy of their respective countries which makes it pure economic stupidity on the part of those countries to leave them to bear alone and unaided the disastrous present effect of a sudden disarrangement of the international credit machinery which they have been accustomed to rely upon for distributing what they produce to the consumerfs all over the world who need it and are willing in due course to pay for it what it is economically worth.

The American cotton crop, however, is our immediate business and we had best return to that. It is unnecessary here to rehearse the details of the situation that presents itself. These are known to every member of this audience. In the rough, we are producing a cotton crop that now promises to be well over 15,000,000 bales, and may exceed 16,000,000 bales. But for the war, there is no reasonable doubt in the mind of any member of the cotton trade that even the larger of these quantities of cotton could have been sold by the producers for an average price above 10 cents a pound, the lowest limit of the economic cost of production of cotton in the United States to-day. But the war has changed all that, or at least it has completely changed the price that can at present be realized for cotton, and would have changed it still more, had it not been for the tenacity shown thus far by great numbers of cotton farmers in refusing to sell at such prices as have been offered them. Yet there is much confusion of thinking about the fundamental causes of this new and unhappy state of things. And in all the discussions of the matter that have come to my attention, the commercial reason given for this great decline in the price of cotton, shown even before the real weight of the crop has come upon the market, is that the war is going to occasion a tremendous reduction in the consumption of cotton this year. It is common to estimate this reduction in consumption at between 4,000,000 and 5,000,000 bales; and it is assumed that at the end of the season something like this quantity of cotton will remain in this country, to be carried by somebody, instead of having been exported to foreign countries and paid for with the money of those countries. The load appears to be one of mammoth proportions; and by the vast majority of those who are discussing the matter it is assumed to be necessarily a pure dead load. There is, according to this view, no escape from the conclusion that we ourselves must assume this load in its entirety. We must find ways in which this great mass of immobilized cotton can be stored in warehouses and carried along until the war is over. The great question, it is urged, is how to find a means by which the load can be carried and still money enough provided for the cotton producers, on the basis of their unsold cotton, to preserve them from ruin and to enable them to pay enough of their debts to preserve from ruin the merchants, banks, etc., that have advanced upon the cotton in anticipation of its marketing. Hence the stress laid upon the usefulness for the occasion of the Allrich-Vreeland emergency currency and of the soon to be issued Federal Reserve currency; hence the eager haste to erect warehouses all over the South; hence the innumerable schemes for valorizing or quasi-valorizing cotton; hence the attempts to lighten the load somewhat by means of "buy-a-bale" movements, "nothing-but-cotton-garments" movements, and the like. The central idea in all these suggestions and plans, save perhaps the very last, has been to remove the weight of the supposed 4,000,000 to 5,000,000 surplus bales from the market and to make it possible to carry them over to future years, when restriction of the acreage, voluntary or forced, will have reduced the supply of American cotton to such an extent that a very high price may be obtained for the cotton thus carried forward.

At this point I shall venture to digress a little, to say that when I was invited in July by your persuasive Secretary, Mr. Woodbury, to address you at this metting, the theme suggested to me by him was the Lever Bill for the regulation of cotton exchanges and its effects upon the cotton trade. Since then the European War, with all its direful consequences, has intervened, and it has seemed more fitting that I should take as my subject the cotton situation as a whole from the point of view of the American cotton trade. The Lever Act has its place, and a considerable place, in the discussion of this subject and I shall have occasion to speak of it; but what is of more importance at this juncture than the Lever Act is what the cotton trade thinks can be done and ought to be done to relieve the cotton situation; and, further, what part the cotton trade can

take, or might take but for certain obstacles, in the doing of this. I think I may say without acrimony that the cotton trade has not as yet been invited to take any part at all. On the contrary, the trade has been very clearly shown on more than one occasion,—as, for example, at the important cotton conference called at Washington by Secretary McAdoo,—tha its participation is not desired or expected. But after all, the cotton trade has had considerable experience with cotton; and, in respect of the foreign commerce in cotton, it perhaps knows more than any or all of the three classes of persons whom Secretary McAdoo mentioned at the conference as having been called together by him to make suggestions about the cotton problem, i. e. the cotton producers, the American cotton manufacturers and the bankers. At some time, either in this or in future years, it is going to be the task of the cotton trade to find foreign buyers for the surplus cotton of this year's crop. Neither the cotton producers, nor the cotton manufacturers, nor the bankers of the United States can do this, because, in the first place, they do not know how, and, in the second place, their credit as reliable cotton merchants is not good enough with foreign merchants, foreign spinners and the foreign banks that regularly finance these merchants and spinners. Hence it may not be impertinent for a member of the cotton trade, who has had some opportunity to study the methods of the trade and the manner of thinking of its members, to give brief expression to their point of view.

The cotton trade generally, although it fully recognizes the painful immediate effects, for the cotton producers and for the country at large, of a large production of cotton at a time when unprecedented events make the disposal of it at any reasonable price a matter of prodigious difficulty and risk, does not believe that the world's normal consumption of American cotton is going to be materially reduced, even in the period immediately following the European War, or that the crops which the United States is producing year by year are too large to supply this consumption, or that the market value of American cotton is going to remain below the economic cost of production,—now almost universally accepted as rising 10 cents per pound,—for more than a brief time after the ways of commerce are opened again, the international credit exchanges are re-established, and the general machinery of commercial intercourse between the nations of the world is once more in operation. Although the trade is, of course, necessarily somewhat affected by the enormous estimates of the economic loss occasioned by such a war as is now raging in Europe, it knows that these estimates are to a great extent illusory and that in an astonishing short time after the conclusion of the war, the losses will be automatically repaired. Whatever may be the effect upon the credit of individuals, there is no economic loss in a shrinkage of the market value of evidences of the ownership of property, such as stocks and bonds, so long as the property itself is not destroyed and remains capable of being put to its original productive use. The loss of the munitions of war expended by the warring countries is virtually none at all, for they have already met the cost of these before the war began. The loss of the season's crops of the belligerent nations means simply a year's privation for the citizens of those nations, and as soon as the next year's crops are produced it will leave no economic trace behind. The loss of lives in battle and the permanent disablement of the wounded and sick by reason of the war is, of course, a true economic loss, but the number of the killed and permanently disabled, even in the greatest of wars, is so small in proportion to the number of the human race or even to the populations of the countries involved, that the effect upon the consumption or the price of any of the great commodities is of the most temporary and insignificant kind. In only one respect is the population, even of the countries at war, permanently affected in respect of its purchasing power; the great expenditures of governments of money and credit in the prosecution of the war must finally be capitalized in the form of enormous debts, whose interest and amortization must be met by taxation, reducing by so much the net incomes of the citizens. The truth is that the ultimate economic result of modern war, on however great a scale it be conducted, is to make the rich somewhat richer and the wage-earners and small people somewhat poorer, as regards their power to purchase commodities. But every sound economist since John Stuart Mill has observed that the influence of this upon the demand or the price for the great commodities, like cotton, is slight and ephemeral.

Of all this the cotton trade as a whole is well aware; and, consequently, it takes with more than a grain of salt all confident predictions that the coming years are to see a very marked decrease in the world's consumption of cotton, American or other, and a severe reduction in the price of cotton, unless the production of it is violently restricted. In other words, the most intelligent part of the cotton trade is convinced that there is an intrinsic value in cotton, quite distinct from the temporary market price which present embarrassments due to the European War have brought about, and that this intrinsic value is at least the economic cost of production of such a crop as we have raised in the United States this year.

Looking at the cotton problem from this point of view, the cotton trade finds it essentially one purely of the temporarily disordered machinery of modern financing and marketing, and not one of fundamental conditions which must be met by permanent changes in production and distribution. A temporary gap must be bridged; and the whole question is how to do this without false starts, unnecessary and disturbing expedients, and the initiation of programmes and policies whose ultimate outcome none can foresee. It is obvious that it will be profoundly harmful, not only to the cotton producers of the South, but also to the entire country, that the prices realized for the cotton which has been produced, should be ruinously below the cost of production. This cotton will not realize any such price, however, if sound means are employed to enable the cotton trade to make a market for it. There is a general belief in the trade that there are such means; but it is certain that they have not yet been clearly seen and made effective by those within whose power they lie. On the contrary, almost all that has thus far been suggested has been of a nature to impress the trade with its futility, its danger or its lack of adaptation to the end in view.

It must be frankly stated that the cotton trade, relying upon its own experience in the past, regards the mere withholding of cotton from the market, storing it for the future and borrowing money upon it, as one of the surest means of depressing the price and keeping it depressed for an indefinitely long time, that can possibly be adopted. Any experienced cotton merchant will say that the accumulation in the hands of inexperienced holders, whether farmers or others of 4,000,000 or 5,000,000 bales of cotton, would keep the price of cotton low, not merely this year but probably for several years, despite any conceivable reduction in the acreage that might be brought about. The cotton trade has learned that there is but one certain way to take care of a temporary surplus of cotton, and that is to sell it not for present but for future delivery,—to spread it over future years, instead of leaving its whole weight to bear down upon the market of the present year. Twice at least, during the past decade, ruinous low prices for a single over-abundant crop have been prevented by the ability of the cotton trade to make contracts for far distant deliveries of the cotton,—contracts which the merchants concerned protected, or "hedged," by purchases of contracts sold against the immediate

supply. The surplus of the record-breaking crop of 1904-1905 was thus spread over the next three years at least. But, more striking still, the surplus of the monster crop of 1911-1912 was spread in this way over years as far ahead as 1920. It is well known in the trade that at this very moment and at the very prices now quoted there are responsible spinners in all the accessible cotton manufacturing countries in the world, even including Belgium and France, who would be glad to contract for deliveries of cotton to them in 1915 and later years, if the machinery for so doing were in operation. Every hundred bales thus sold would mean the purchase by the merchant making the contract of a "hedge" contract representing 100 bales of our present unmarketable supply. I have myself recently heard of a spinner desirous of contracting for no less than 25,000 bales of cotton, with the deliveries to him to begin in October, 1915. Could this transaction have been consummated, the burden of our surplus of this year would have been diminished by this not inconsiderable amount.

But the transaction could not be consummated; the machinery for its consummation is not now in operation. And this brings me to the matter of the difficulties with which the cotton trade is now contending, the obstacles in the way of the operation of the machinery by which in the past it has produced its beneficent results in preventing a temporary over-supply of cotton from causing ruinously low prices for the producers and a grave economic loss to the country as a whole.

As everybody knows, the cotton exchanges are closed both here and abroad. Hence the making of contracts for future delivery, whether as "hedges" or for the purpose of acquiring or disposing of the beneficial interest in cotton, is virtually impossible. The entire organization of the modern cotton trade centres about cotton exchanges and the contracts for future delivery made upon them. These contracts are the instrumentalities devised during the past hundred years by merchants who buy and sell the great world commodities, cotton among them, for the sub-division and spreading of the risk of loss occasioned by fluctuations of the prices of these commodities. Though not insurance in set form, they constitute insurance in reality. By reason of them, dealers in such commodities are enabled to conduct their business with a lower margin of profit and a smaller proportionate amount of capital than any other merchants must have. In the cotton business the expected margin of profit is less than 1 per cent; and the total amount of capital devoted to the cotton business in the United States and England together, though not exactly ascertainable, is almost certainly less than 10 per cent of the value of the American cotton crop in a normal year. The merchants, spinners and speculators who make contracts on the cotton exchanges for one or another purpose are scattered throughout all the countries of the world where cotton is grown or manufactured. And a result of this fact is that the European War has tempararily made it impossible for the cotton exchanges to go on with their business until their members have found ways in which to adjust or liquidate contracts made for persons now inaccessible by reason of the war or unable to make remittances from distant countries by reason of the break-down of a large part of the machinery of international exchange. Very heavy losses have had to be submitted to by the members of the exchanges,—certainly over 10 per cent of their total capital; and they are still in uncertainty with regard to a large mass of outstanding commitments, not knowing what further losses they must bear. On the other hand, they are making progress with the untangling of their affairs; and, if other conditions are favorable, it may be expected that they will find themselves in a position to open the exchanges in the not far distant future.

But other conditions must be favorable; and it is here that the rub comes. There are two primary requirements for the re-opening of the cotton exchanges, and several secondary requirements. The two primary requirements are: first, that the mechanism of international credit should be in free motion again. Remittances from country to country must be possible at a reasonable cost, and it must be possible for cotton merchants to ship cotton to whatever foreign markets promise an outlet for it, drawing the customary bills of exchange against it. In other words, they must be able to distribute the cotton to all the points of vantage that they can discover in foreign consuming countries and to finance it in such a way that their correspondents in those countries can in their turn conveniently dispose of it to spinners or investors. It is, in the opinion of the cotton trade, a very fortunate thing that American bankers have undertaken to provide London, the great centre of international credits, with some $180,000,000 in gold, and that the Federal Reserve Board has approved of and assisted the plan. As a basis for new acceptances in London and as an aid to the free movement of foreign exchange this gold in London, (or, what is the same thing, in Ottawa), will, as time goes on, afford cotton merchants more and more fully the indispensable facilities for getting a large part of the exportable surplus of American cotton off of our hands, and into the hands of foreign merchants, manufacturers and investors, who are in a position to finance it in their own countries.

The second essential prerequisite of the renewed activity of the cotton trade, both in respect of its individual members and in respect of the co-operative activities of these members on the cotton exchanges, is that there should be a calculable basis upon which the banks, South and North, backed by the Federal Reserve Board, will loan money upon cotton and will stand by their loans until the recuperative and corrective forces have time to come into play. A point that appears to have been entirely overlooked in the discussions about providing currency to enable the banks to finance the surplus cotton this year, is that the carrying of cotton in the South has not hitherto been done to any large extent by the producers of it or by the country merchants who first buy it,—a few bales for this man and a few bales for that,—but by the cotton merchants who must borrow upon tens of thousands and in some cases upon hundreds of thousands of bales. Protected by "hedge" contracts made on the exchanges, loans thus made, with a very narrow margin, of the merchants' own money, have been found in the past almost the safest of all the commercial loans made by our National banks. But as things now are, the exchanges, if they were to open, could not possibly supply buyers for all the "hedge" contracts that merchants would have for sale. Time must be given for the trade to get into communication with its clientèle all over the world and to bring buyers into the market. How, then, can the cotton be cared for until this has been accomplished? Only by courage and resolution on the part of the banks in valuing cotton for loaning purposes at a reasonable approximation to its intrinsic worth, instead of at its temporary fluctuating market price, and by determining on the part of the Federal Reserve Board that the inevitable ups and downs of prices of a period of known international maladjustment shall not be taken as measuring the worth of the cotton collateral which banks hold against their loans, and thus indirectly against the paper which they offer for rediscount to the Regional Banks, and through them to the Federal Reserve Board itself. This is substantially the course which the English Government of Egypt has resolved to take with regard to the present Egyptian crop, the loaning value being fixed at £2 per cantar of 99 pounds, as against a normal market value of somewhat above £3. It is not improbable that the same expedient will be adopted by Australia with regard to her wool; and other coun-

tries with important export commodities are not unlikely to follow suit. This, obviously, is neither governmental valorization, nor even indirect valorization, for the borrower, through his own bank, is still held for any ultimate loss that may be incurred. But it is a means for enabling the borrower to have a reasonable time in which to set in motion all his agencies for the sale of the cotton, whether at home or abroad; and, at the same time, it re-establishes in the minds of all who resort to the cotton exchanges a sound conception of the value of cotton, rids them of the fear of a sudden deluge of sales from disheartened or over-burdened holders, and stimulates the impulse of spinners in the uttermost parts of the earth to secure for themselves, through contracts for future delivery, whether on the exchanges or made with cotton merchants, some portion of the supply of cotton which in their hearts they know to be selling decidedly below the cost of its production and below the price that such cotton must bring as soon as the peaceful intercourse of nations one with another is renewed.

Such are the requirements of prime importance to enable the cotton trade to resume its usual functions and to exert all its powers in order to get in touch with every merchant, manufacturer and investor (or speculator, if you will) from one end of the world to the other, who can be made to see that the time is propitious for him to make provision of cotton for years ahead, as well as for this year. The number of such persons is enormously great, if they can be found and brought into the market; and they are willing to pay much more than a bargain-counter price for their cotton. As they buy, spinners will also buy for this year's consumption; and it may be well to express here a private opinion that most of the estimates of the reduction in consumption this year are fantastical. It is my personal belief, from a study of the entire field, that not less than 13,000,000 bales, and possibly 500,000 bales more than this, will be consumed by spinners before this season is over. If this forecast is correct we shall have no unbearable carry-over at the end of the year,—certainly not more than can be cared for by the sales for forward years of which I have spoken. Indeed, our carry-over, visible and invisible, at the end of the season of 1911-1912 was nearly, if not quite as great.

I have spoken of secondary obstacles to the opening of the cotton exchanges and to the resumption of the activities of cotton merchants. I have already too much prolonged this paper, and I shall accordingly speak, and that but briefly, of but one of these obstacles, the United States Cotton Futures Act, more commonly known as the Lever Act. Even the cotton trade itself is only beginning to perceive the imperfections and obscurities of this Act as a piece of legislation, and the unthought-of consequences of the Act when its terms are interpreted, as they must finally be by the courts. The New York Cotton Exchange has recently been endeavoring to frame a form of contract in conformity with the law, and has been in continued consultation with the Department of Agriculture upon the subject. I do not think I am exceeding propriety when I say that as regards important provisions of the Act, it is impossible to interpret them in strict accordance with the terms employed, without producing effects which are contrary to all reason and which certainly never were intended by the proponents of

the measure or by Congress itself as a whole. An initial difficulty is that, inasmuch as the Act is ostensibly a taxing measure, its final interpretation rests with the Commissioner of Internal Revenue, and not with the Secretary of Agriculture at all. If the latter endeavors by his rulings to adapt the law to the obvious necessities of the commerce in cotton, the former may rule that the law must be interpreted in accordance with the language actually used. Even rulings by the Commissioner of Internal Revenue are not absolutely final, for a provision for a reward to informers will assuredly lead to the insistence of such persons upon a literal, rather than an accommodating interpretation; and the courts will be called upon to decide the issue. But these are not the most dangerous features of the law, from the point of view of the cotton trade. It is known that the foreign exchanges cannot possibly adopt the provisions required to be made a part of the contract for future delivery used on cotton exchanges, if the contract is to be tax-free. The very nature of the business of those exchanges precludes this. Hence every order sent from this country to a foreign cotton exchange involves the payment of a tax of 2 cents per pound, or $10 per bale. It is obvious how perilous the position of a somewhat over-burdened futures market in the United States is made by this provision. If a slight selling movement begins, no one can buy the cotton here and sell it abroad until there has been so great a decline here as to provide not only the profit of the arbitrageur, but also the money to meet this tax of $10 per bale, which he must pay. Nor does this requirement apply only to future contracts, pure and simple; it applies also to sales of actual cotton for future delivery ordered to be made "in, at or on" a foreign exchange. Virtually all the cotton merchants of Liverpool have their offices in the Liverpool Cotton Exchange. Hence an order from a cotton merchant in Waco, Texas, to a Liverpool cotton merchant, for the sale of, say, 1,000 bales of actual cotton for delivery in a future month, implies the payment by the Waco merchant of a tax of $10,000.

These are but examples of the hazardous and, in many cases, still uncomprehended provisions of the Lever Act. I have called the Act one of the secondary obstacles to the resumption of the buying and selling of cotton by the cotton trade, whether on the cotton exchanges or outside of them. Perhaps I should better say that the fact that such a measure is on the statute books and must somehow be put into effect on February 18 next, is one of the greatest pieces of misfortune for the cotton producer and for the country that attend this disturbed and uncertain time.

Things and actions are what they are, and the consequences of them will be what they will be; why then should we desire to be deceived?—Bishop Butler's Sermons at the Rolls.

WE have heard it wisely said that only one who has been himself an experienced speculator in times of peace is competent to judge the probabilities of success on one or the other side, in respect of great nations embroiled in war. Military men, even the most competent, are trained to observe the technique of strategy and tactics, the mechanical perfection of armament and other provisions for war. They know little of spirit of nations, the state of mind of governors and soldiery, that work incessantly for ultimate victory or defeat. To them the difference between national ideas and ideals, reasonably and hence unshakably held, and national delusions is inconsequential for the determination of the outcome. The experienced speculator, on the other hand, has seen and taken part in war in microcism, and he finds therefore nothing unfamiliar about war in its larger and more savage manifestations. He has seen Napoleons of finance wax and wane; he has faced them and fought them; he has witnessed the growth about them of a legend of invincibility and assured success, with its compelling influence upon the majority of persons brought in contact with them; and he has observed and profited by the illusions of greatness and all-powerfulness that gain upon their minds, lead them on to more and more desperate projects, and finally bring them to their Waterloo. The experienced speculator becomes, without knowing it, a genuine Greek of the great Athenian time, with his firm conviction that the laws of life are: "Carry nothing too far," and "success begets immoderate self-confidence, and this delivers one touched with it to the Furies of Hell." Imponderable forces withstand the best efforts of such an one; time fights against him; his errors accumulate to thwart him; and at the end he loses not only what he would gain by the assertion of his force, but also all that he had thought was solidly his. To the experienced speculator the whole doctrine of Nietsche is pragmatically absurd. He has found that there are no "super-men," and that "force" incarnate is synonymous with ruin at the end. These are considerations that appear idle to military men and that commend themselves little to such as conceive the life of men and of nations from the point of view of the chess-board of the past which is history. To both these classes of persons the skill of the move is the main thing; to them the man or the nation that is master of the move on the board is the assured victor. But the experienced speculator knows that there must be something more, i. e., that simpleness and clearness of prevision which is incompatible with any assurance on the part of the player that he is master or that his opponent is doomed to defeat. It is not the "super-man," whether in markets or in companies, who is finally able to say "Check" to his antagonists.

From the standpoint of the experienced speculator it is an ill omen for Germany in the present European War that there is, in so large a part of the utterances of her leaders, whether of the military class or of the business class or of the class of thinkers and publicists, a note of conscious and asserted superiority over the enemies with whom the nation is contending. The delusion of proved greatness and of undeniable right to ascendancy is an extraordinarily dangerous accompaniment of thinking when alert foes must be met. The very carefulness engendered in them by the assumed superior force of what they oppose is a perpetual peril, and makes their strokes, when they given them, exceptionally telling. The damage done by these strokes is enhanced by the surprise they occasion. And when the strokes are multiplied, surprise is only too apt to yield to distraction. The distracted "super-man" is the weakest of all creatures in the world.

These reflections are the result of no inconsiderable amount of reading, during recent weeks, of such financial and economic publications as have reached us from Germany. We have been much struck, in perusing these publications, with the unanimity of German opinion to the effect that the dreadful confusion and the irreparable losses in the field of finance and commerce, outside Germany, occasioned by the European War, demonstrate finally the superiority of all that is German in this domain and the fundamental weakness of all that is not Germany. According to the writers in these publications, Germany alone among the nations of the world has had a financial and commercial system, product of the disciplined knowledge of her financiers and leaders of industry and commerce, able to withstand, without interruption of its normal operation, the most violent shocks of the greatest and most extensive of known wars. In Germany almost alone among European nations no moratorium has been found necessary; there alone manufacturers and merchants have been able to obtain an abundant supply of credit; there alone industry has not been checked and workers have not been thrown out of employment, except in so far as they have been called to take their places in the ranks; there alone the population has been able to make the sacrifices which every war implies without any material disturbance of the normal course of its affairs. In the great-

est contrast with this fortunate state of things is the paralysis of business activities and of the operations of credit in the other countries of Europe, and most of all in England. There the test of stern reality has been applied, and the fabric so long trusted and admired has been found a sham. The prestige of London must from now on be regarded as a thing of the past. That great market place of the nations has been tried and proved wanting in all the powers hitherto believed to be there.

It is perhaps well to give what the French call a *piece justificative*,—a bit of documentary evidence,—of what has just been said. One of the best known and most widely read writers upon financial subjects in Germany is Herr Georg Bernhard, who publishes a study of some aspect of finance or commerce every week in his own paper, "Plutus." Soon after the war broke out, and when the shock of it was producing its maximum effects upon international credit and commercial intercourse, Herr Bernhard undertook to point a moral and adorn a tale by contrasting what was taking place in London with the easy functioning of the financial and commercial machinery of Germany. Here are some passages which illustrate the whole:

"It is certain that the legend of the all-powerfulness of the English money market is already completely confounded. England has suffered a blow in the field of commerce and finance from which she will be very slow indeed to recover. It is no new thing for the Bank of England to give up for the time being her antiquated system; and it would hardly have occasioned surprise if upon this occasion also, as often in earlier years, the out-of-date Peel Act, which narrowly limits the extent of the note circulation of the institution, should have been suspended. But it is not probable that even England's bitterest enemies expected the total collapse of the English financial system which has occurred on the present occasion. England owes her political friendships not merely to the *beaux yeux* of her people or to the mighty reputation attending her fleet, but far more to the belief in the unlimited ability of London to absorb foreign loans. Of late, even in times of peace, Russian finance has looked askance at London; but certainly in St. Petersburg, as well as in Paris, the opinion was universal that in case of necessity London would finance Russian and French war loans. But a speedy end was put to these dreams by the raising of the English discount rate to 8 per cent and then to 10 per cent. * * * But what followed was far worse. For if England at the start had merely proved to the world that her financial abilities in times of peace had been generally rated too high, she now destroyed her reputation for honorable business dealings by locking up private German money within her borders. What England did in this matter was indeed the very thing that might have been expected of her; for it had been English publicists who first gave it out as a self evident principle that there is no obligation to make payments to a country with which one is at war. * * *

"Up to now it had been believed that the solidity and the peculiar construction of England's credit system, which had produced the result that English industry and commerce for the most part had to get along with their own capital resources and knew nothing of such a credit economy as we have in Germany, made the English industrial system completely independent and to a great extent modified the imperfect results of departing from the true system of operation of the central bank of issue. But exactly the opposite proved to be the case. Here in Germany we have as yet got along perfectly without any moratorium at all, while England was compelled to put the moratorium into effect immediately. Here in Germany, the credit crisis has passed off mildly, while it has already brought catastrophes in England. A little reflection makes it easy to perceive the reason for this difference: In England the granting of credit on a large scale for industrial purposes is exceptional. Hence the entire English banking system,—not only the Bank of England, but the private banks also,—is not perfected to this end. If all at once a considerable number of enterprises call for such credit, it is not to be had."

Such is the German interpretation of the difficulties of the financial and banking organization of England, by reason of the European War. Defective planning, unscientific adaptation to the requirements of industry and commerce,—these are the causes, according to our Germany authority, for the interruption of that free flow of credits through London upon which the entire world, Germany included, has come to depend. And over against the technical faults, as well as the over-rated resources, of London's credit system, must be set the scientific adequacy of the German system, with its freedom from moratoria and similar signs of profound disturbance.

But the truth is that all this is little less than financial insanity, a form of megalomania which has not the slightest justification in fact. For it is Germany herself, more than all other causes, that is responsible for the clogging of the world's credit machinery, as that has for long years been in operation through London. We do not mean by this assertion to show partisanship for England in respect of the responsibility for bringing on the European War. That is another question altogether. But we do mean that all the information available points to the conclusion that what the London market is now suffering from more than all else and what is the chief cause of the blockade of international credit in London, with its deplorable effects for the whole world, is the enormous burden of unpaid acceptances and of advanced-upon securities which London is carrying for Germany herself and for her ally, Austria-Hungary. Somewhere from £150,000,000 to £200,000,000 is believed to be the extent of this load; and this is the money which, kept at home, instead of remitted to London to pay debts, is enabling Germany to do without a moratorium and to afford the necessary credits for her industries. It is no doubt true that London is carrying a similar, though far smaller load, for other European countries, some belligerents and some not; but the great immovable mass of unliquidated credits and advances in London is for German or for Austrian account. And it is the fear of the losses that may have to be borne by English banks and bankers because of this state of things that the paralysis of the customary international activities of these banks and bankers is so complete. This is the reason, for example, why the United States cannot export her cotton, nor Austria her wool, nor India her jute. Bills of exchange cannot be drawn against these commodities, because there are no banks or bankers in London who dare to increase their commitments in the form of acceptances until they have found out whether they are to be paid for the immovable mass of German and Austrian bills already in their portfolios.

Arthur Richmond Marsh

POSSIBILITIES IN PORTO RICAN TRADE.

A WELL-KNOWN Western manufacturing firm recently sent an agent to Porto Rico. Large results were not expected, but the agent selected was an able investigator and spoke Spanish. He found to his surprise that his line of goods had been very poorly covered in the island, and succeeded in securing customers who now give his house several thousand dollars in business each month. He concluded an arrangement with an influential resident of Porto Rico for permanent representation of the house, and now regards this venture as one of the most valuable recent developments in his line of business.

We are inclined to think that a thorough knowledge of the commercial possibilities of this rich section of United States territory is confined to a very few. It may not be without value at this time to examine its tremendous development during the past fifteen years.

We may well be proud of the results of American occupation of Porto Rico. We cannot claim to be the discoverers of the island, for Columbus sighted it on his second voyage, in 1493, and it served as a plaything for a long line of adventurers, beginning with his lieutenant, Ponce de Leon. Fleets and land expeditions of Spain, England, France, and Holland contended for its rich products. Rapacious and ignorant governors exploited the natives. And the riches which were the coveted prize of all were dissipated, or even prevented from coming into existence, by the relentlessness of the struggle to possess them. In the sense that we have given the island an opportunity to realize its own possibilities we may very justly claim to be its discoverers, as well as its liberators.

Before setting out the striking figures covering the recent commercial development of Porto Rico it will be well to review its location and physical characteristics. It is the easternmost section of American territory, on the longitude with St. John, New Brunswick, and is also the southernmost, lying one hundred miles south of the extreme southern point of Cuba. The climate, however, appears to be superior to that of the rest of the West Indies, owing to the effect of the North East trade winds. Insects are less troublesome here than in Cuba and venomous snakes are unknown. The area of the island is about one-half that of the State of New Jersey, or 3,435 square miles, about a quarter of it being under cultivation; and the Government is spending several million dollars in irrigation development which will substantially increase the fertile area. The natural beauty of Porto Rico is a very considerable asset to its people. A mountain range, two thousand to three thousand feet high, runs East and West along the entire one hundred miles of its length, dropping abruptly to the sea at either end. Gorges and tumbling streams, and a rich and varied foliage give the landscape an unusual charm.

The natural advantages of the place have attracted a population as dense as that of the State of Massachusetts. There were 1,118,012 persons on the island in 1910. In 1860 there were 583,308. Three-fifths of the working population are farmers, raising chiefly sugar, tobacco, coffee and fruit. Sixty-five per cent of the people are white, widely distributed over the island. There is little concentration in cities and towns. San Juan, the largest city, has a population of nearly 49,000.

Despite the intelligent assistance afforded the Porto Ricans by our Government, they have hardly yet recovered from the tremendous financial pillage and waste which characterized the insular government up to 1898. For years the expenditures exceeded the income, and the first actual surplus appeared about 1860. One of the most peculiar incidents connected with the early fiscal policy was the imposition in 1868 of an export tax on Porto Rican products. This brought nearly $600,000 a year into the treasury, but practically ruined agriculture. Even at the present time we export to that fertile region nearly $800,000 worth of vegetables annually. The surprising instability of the commerce of the island produced by the caprice and rapacity of its governors is strikingly shown by the trade figures covering the years previous to the complete establishment of American influence. The average value of annual imports for the years 1828-1832 was 2,395,302 pesos (peso equals 97 cents). The average value of exports for the same period was 3,133,896 pesos. Soon after this time, exports fell behind imports in value, although the per capita production was low. In the year 1849 imports increased over 500,000 pesos in value over the previous year, while exports decreased nearly 200,000 pesos from the 1848 value. By the time of our Civil War imports exceeded exports in value by nearly 3,000,000 pesos annually, and this preponderance was maintained up to 1883, when the annual five-year average of imports had reached the value of over 14,500,000 pesos and that of exports a little less than 11,500,000 pesos. It is even more interesting to note that of the imports, the majority came from the neighboring West Indies, indicating most forcibly the artificial conditions which must have been imposed upon the inhabitants to permit the profitable importation of products which their own land should have produced in abundance. In 1830, 53.5 per cent of Porto Rican imports originated in the West Indies, 27.3 per cent in the United States, and the remainder in Europe.

At the present time 86 per cent of the commerce of Porto Rico is with the United States. The figures covering this portion of the trade of the island, up to the time of the American occupation reveal further the unsteady conditions which prevailed. The total commerce of this country with Porto Rico in 1888 reached a value of $6,382,101. It did not reach this figure again during the five years following, and the five-year average ending with 1892 was just over $6,000,000. The total commerce with the United States for 1895 was $3,340,056, and the average for the five years ending with 1897 was $4,856,815.

Porto Rico was ceded to the United States by the treaty with Spain of December 10, 1898. The present form of government was established under the Foraker Act on April 12, 1900. The total value of Porto Rican trade had fallen in 1900 to just over $9,500,000 from a value of over $24,000,000 in 1895. The total value jumped to over $17,500,000 in 1901, to over $25,500,000 in 1902, to over $29,500,000 in 1903, and rose steadily until in 1912 the very substantial figure of $92,678,304 was reached, imports being nearly $43,000,000 and exports nearly $50,000,000. There was a falling off in 1913 of approximately $6,000,000, chiefly under the head of imports into the island. The following table brings out vividly the increases mentioned, with the proportionate share of the United States in the total trade value:

TRADE OF PORTO RICO, 1896 AND 1913.

IMPORTS.

	From United States.	From Other Countries.	Total.
1896	$2,646,519	$9,529,440	$12,175,959
1913	33,155,005	3,745,057	36,900,062

EXPORTS.

	To United States.	To Other Countries.	Total.
1896	$1,699,704	$10,515,375	$12,215,079
1913	40,538,623	8,564,942	49,103,565

The exports to the United States in 1913 were made up largely of sugar, tobacco and fruit. The exports to other countries consisted chiefly of coffee which brings a higher price in [illegible] markets. Approximately $39,000,000 of the total value of [illegible]

000 exported to the United States was made up by sugar and molasses ($27,226,905), tobacco, manufactured and unmanufactured ($8,971,573), and fruit and nuts ($3,115,257).

The chief imports from the United States are shown in the following table. This list includes approximately $27,000,000 out of the total value of just over $33,000,000:

CHIEF IMPORTS INTO PORTO RICO FROM UNITED STATES 1913.

Breadstuffs	$7,655,353	Mineral oils	$660,028
Cotton, manufactures of	3,821,535	Soap	578,587
Meat and dairy products	3,499,712	Paper and manufactures of	554,014
Iron, steel and m'f'rs of	2,939,442	Fish	535,202
Wood and manufact's of	2,003,446	Chemicals, drugs, dyes and medicines	496,507
Leather and manuf't's of	1,441,605	Tobacco and manufactures of	414,184
Sugar, molasses candy and confectionery	819,305	India rubber, m'f'rs of	397,638
Vegetables	787,105	Coal	302,656
Carriages, other vehicles and parts	733,589		

Sugar culture is the preponderant source of Porto Rican wealth. The output has increased tremendously under American control. It was just over 50,000,000 pounds in 1865; 167,000,000 pounds were produced in 1872; only 50,000,000 pounds in 1881; and only 56,000,000 pounds in 1895. In 1901 the output was 137,000,000 pounds, and there has been a steady increase in every year but one since that time. In 1907 the total dropped to 408,000,000 pounds, as against 410,000,000 in 1906; but the 1906 output had shown an increase of 139,000,000 over that of 1905, so that the falling off was not vital. There has been a consistent increase in each subsequent year to the 1913 maximum of 765,420,310 pounds. If Porto Rico has yielded us no other benefit, its sugar crop would alone justify the commercial side of our undertaking. The demand for sugar is increasing steadily and it is one of the interesting developments of our time that the per capita consumption of this commodity in the United States has increased from 18.17 pounds in 1865 and 32.73 pounds in 1870 to 85.04 pounds in 1913. The cost of granulated sugar per pound wholesale in New York in 1870 was 13.51 cents, and in 1913, 4.28 cents.

The tobacco exportation of Porto Rico is increasing in importance, both in quantity and quality, and considerable development may be looked for in the future in this field. At present the home consumption is high. Of nearly 285,000,000 cigars made on the island in 1913, slightly more than 165,000,000 were exported and 119,000,000 consumed at home. Of over 473,000,000 cigarettes made in Porto Rico last year, nearly 465,000,000 were locally consumed, an average of over 460 for every man, woman, and child on the island. Not quite 9,000,000 were exported. It is noticeable that, as in the case of vegetables, it is not always the obvious that governs the character of our exports to Porto Rico. During 1913 we exported $414,184 worth of tobacco products to this apparently well supplied island.

Unhampered by customs restrictions and within comparatively easy reach of our shores, Porto Rico offers an attractive field for American exporters. There are indications that considerable business remains for the merchants and manufacturers who will take proper steps to secure it.

THE COST OF THE EUROPEAN WAR

WE laid some emphasis last week upon the tendency on the part of financial writers to over-estimate the probable direct destruction of property, the actual waste of capital, resulting from the present war. It will be well to look into the question of expenditure actually involved, on the basis of annual budgets, special appropriations, and the national debt. The European War will leave some heavy bills behind it, and the people who must pay those bills should be interested in forming an estimate of their probable size.

In the first place, the war estimate in 1913 for the belligerent nations were as follows:

ARMY AND NAVY ESTIMATES, 1913.

	Army.	Navy.
Triple Entente and Belgium	$814,067,059	$443,761,880
Germany and Austria	289,797,732	131,787,385
	$1,103,864,791	$575,549,265
Total, army and navy		$1,679,414,056

Soon after war was declared Germany appropriated for immediate use $1,250,000,000; France, on the same day, $1,000,000,000; and Great Britain, on the next day, $500,000,000, making a total of $2,750,000,000. The sums appropriated by Russia, Austria and Belgium have not been made known, but an estimate based on the proportionate size of their operations could not well be less than $1,250,000,000, which would bring the total to $4,000,000,000; and this sum is sure to be further augmented by additional appropriations from Great Britain. For our present purposes we shall place our estimate of special appropriation at $4,000,000,000.

It remains to consider the existing indebtedness of the nations now incurring such heavy additional burdens. They are approximately as follows:

INTEREST BEARING DEBTS.

	Debt.	Annual Interest.
Great Britain	$3,400,000,000	$103,000,000
France	6,300,000,000	195,000,000
Russia	4,510,000,000	180,000,000
Belgium	745,000,000	22,000,000
	$14,955,000,000	$500,000,000
Germany	$1,225,000,000	$42,000,000
German States	3,610,000,000	133,000,000
Austria-Hungary	3,615,000,000	145,000,000
	$8,450,000,000	$320,000,000
Grand total	$23,405,000,000	$820,000,000

The remaining item of cost is at once the largest and the most difficult to fix upon exactly. A careful estimate by Professor Charles Richet has gained wide acceptance, and we shall rely upon it at this time (although there have been various estimates ranging from $23,000,000 to $84,000,000, a day). Professor Richet's figure is $50,000,000 a day, or $17,250,000,000 a year. This covers the actual operations in the field.

We have now to estimate the credit account to be set off against this heavy liability. Sir George Paish in the London "Statist" has estimated the combined annual income of Great Britain, France and Germany, from all sources, at $28,000,000,000. If we include Russia, Austria-Hungary, and Belgium, this income total would amount certainly to $35,000,000,000. This figure will be greatly reduced by the war. It is believed, however, that a reduction of 50 per cent will be the limit of possibility. This would give us the following result:

EUROPEAN BALANCE SHEET AFTER ONE YEAR OF WAR.

Annual budgets	$1,680,000,000
Cost of war, one year	18,250,000,000
Interest on national debt	820,000,000
	$20,750,000,000
Income, fiscal year ending June 30, 1915	17,500,000,000
Deficit, one year	$3,250,000,000

On this basis it will be seen that the war cost for one year would exceed by over three billion dollars the income of the nations involved during that year. But this is not the whole story. It must occur to us at once that only a small part of this national income is saved, over and above the actual requirements of the government

for civil expenses, and of the people themselves for living needs. Only such amounts saved would really be applicable for the payment of immediate war charges. This brings us to a very interesting line of investigation, and we can do no better than quote from a recent article of Mr. Charles A. Conant in the New York "Times":

"The distinction between annual production and savings," says Mr. Conant, "is the distinction between what is consumed within the year for food, clothing and similar purposes and the surplus which remains to be put into permanent structures, machinery, and new lines and tools of transportation for the purpose of increasing productive power in the future. The form in which these savings have come to be employed to a large degree in the capitalistic countries is in the purchase of the bonds and shares of joint stock companies, which are thus provided with the means for constructing new railways, cotton mills, or labor-saving machinery.

"The test of the amount of capital which has been applied in recent years to these purposes of increasing production and economic efficiency is found in part, therefore, in the annual issues of new securities. Those issues which are recorded in the financial journals do not include issues by small corporations whose securities are not quoted on the Stock Exchange, but they represent a very large proportion of the saved capital which becomes available to governments if they decide to divert such savings from productive purposes to purposes of war.

"The issues of new securities annually, as estimated by the Belgian financial publication 'Le Moniteur des Interets Materiels' have averaged, over a period of recent years, about $4,000,000,000 per year. This amount is considerably greater than the estimate of such savings in earlier periods, when the modern machinery of production and exchange had not attained its present development. Prior to 1896 total issues of new securities reaching so much as $3,000,000,000 annually were the exception. For the ten years ended with 1893 the annual average was estimated at about $1,250,000,000, and for the ten years ended with 1903 $2,596,000,000. That the average for the ten years ended with 1913 has risen above $4,000,000,000 is a striking tribute to the economic progress which the world has been making during a period of comparative peace.

"It is possible that nearly the whole of this fund for the current year will be diverted from improving the productive plant of the world to the expenses of the present war. How much more saved capital can be thus diverted can only be guessed at. If the figures above suggested, $18,000,000,000 per year, are required for the expenses of the war, then private savings to the amount of another $4,000,000,000, which does not take the form of listed securities, would be taken up, and there would be still a deficiency of $10,000,000,000.

"This means, in the first place, that during the war it will be extremely difficult to raise capital for any other purpose than to absorb the great masses of Government obligations which will be thrown upon the security market and forced into the assets of the banks. It means further than this condition will not end with a year of war, but will continue to absorb the bulk of the world's savings for several years after the war is over."

It would seem to follow from Mr. Conant's figures that the net saving of the world in an ordinary year was $8,000,000,000. He appears to assume that the world's savings will disappear along with that of the warring nations, and so he does not attempt to estimate the part in the world's supply which the belligerent nations produce. It would appear to us liberal to allow them $7,000,000,000. If we were to reduce this amount proportionately, on the basis of our 50 per cent reduction of total governmental income during a year of war, we should have $3,500,000,000 in annual saving, instead of a total annual income, on a war basis, of $17,500,000,000 to apply towards the payment of the estimated annual war cost of $20,750,000,000, leaving a debit balance for the year of $17,250,000,000.

It must be clear, however, at least on theory, that if a nation's income is suddenly cut in half the saving in the nation during the year will be more than cut in half. At such a time few expenses can be reduced at all, much less cut in half. It would probably be sound to estimate that if the national income of the belligerent nations is reduced 50 per cent there will be no savings whatever effected during the year. As a result we must expect that a year of war will cost the nations involved a total of over $20,000,000,000, which must be added to their existing national debt of $23,405,000,000.

Before leaving this elusive but interesting subject, it will be worth while to consider the financial benefits which would arise out of a fundamentally sound peace. Such benefits might involve the reduction of armaments, and thus remove a source of expenditure which in a generation would wipe out the entire national debt piled up by the war. It is not generally realized how large a proportion of national expenditure goes for matters connected with war, or preparation for war. In the case of the United States, the governmental expenses for 1913, exclusive of the postal service, were $748,703,574. Of this amount $160,387,452 went for military items, $133,262,861 for naval items, and $175,085,450 for pensions, a total war outlay of $468,735,763, or 65 per cent of the total budget, leaving a balance for civil expenditures of $179,967,811. According to a table in Dr. D. S. Jordan's book, "The Unseen Empire," the proportion of military charges to total gross expenditures, not including pensions, or interest on the national debt in five nations was as follows:

PERCENTAGE OF MILITARY TO TOTAL EXPENDITURE.

Great Britain	34.3
France	30.9
Russia	23.5
Germany	43.5
United States	43.3

We estimated above that the annual army and navy expenditures of the nations at war were approximately $1,680,000,000, and their total national debt nearly $23,500,000,000. It therefore appears that if these war expenditures could be done away with the total national debt of the six nations could be paid off in fifteen years, and the total debt as augmented by the present war could be paid off within the lifetime of men now living.

Of course no man can tell what the probabilities are as to the immediate future of armament expenditures. It is safe to assume, however, that there will be no immediate elimination of this burden. And it follows that the bills must be paid, both for this war and for past wars. The people who must pay the bills are the rank and file in the nations involved; and also in the nations not actually engaged in the fighting, because they must help, under a system of international finance, to bear the burden of an increased interest rate. "The great expenditures of governments of money and credit in the prosecution of the war," said Mr. A. R. Marsh, in a recent address, "must finally be capitalized in the form of enormous debts, whose interest and amortization must be met by taxation, reducing by so much the net incomes of the citizens. The truth is that the ultimate economic result of modern war, on however great a scale it be conducted, is to make the rich somewhat richer and the wage-earners and small people somewhat poorer, as regards their power to purchase commodities."

It would not seem unfitting to apply to this situation the venerable principle that those who must bear the burden of the taxation should have the deciding voice in the matter of incurring or not incurring additional burdens of this sort in the future.

THE FIRST MORATORIUM IN AMERICA

By Augustin C. Keane

[Reprinted from the "Western Banker and Financier"]

MORATORIUM is a word newly popularized by the European War. One is more likely to find it in a daily newspaper than in a dictionary. Despite its sound, the word's etomology has less to do with death than with dead beats, coming as it does from the Latin "delay." The institution for which it stands is that of extending the time within which debtors may be required to meet their obligations.

Although the word is not to be found in the average dictionary, this postponing of the payment of debts in times of stringency by a governmental decree is not a modern innovation. One of the remarkable episodes in American financial and judicial history revolves around a moratorium which it was attempted to establish in Kentucky as long ago as 1820. With the uncertainty of present conditions, the occurrences of that time are more than interesting to-day, since they reveal not only the dangerous effect of foreign wars upon our own finances, but also the effective fortitude of the old stalwart American judiciary, unmindful of popularity and courageous in duty.

The long duration of the Napoleonic wars had choked financial channels with inflated paper currency. Precious metals were withdrawn from circulation, and privately hoarded. The result was an enormous rise in prices for all commodities. The return of peace brought a wild enthusiasm, and a violent reaction towards specie payments. Prices immediately fell to the lowest minimum. Wave after wave of speculation spent itself, leaving nothing but debts. This condition wrought considerable hardship in many quarters of the United States, but particularly in the frontier States. Of these Kentucky especially suffered a serious contraction of the circulating medium. In 1820 so great did the pressure of debt become in Kentucky, that the Legislature enacted a moratorium, extending the period within which judgments might be recovered from three months to twelve. This relief proved insufficient to help the terrible distress of the debtor class. After attempting other futile remedies, the Legislature of that year enacted a moratorium staying the collection of judgments, on certain conditions, for two years, and declaring that the relief thereof should apply also to debts incurred before the passage of this act. A complication of circumstances and conditions arising from the relation of the Bank of Kentucky to the Bank of the Commonwealth, and the peculiar provisions for currency or specie payments transferred the hardship from the debtors to the creditors. The moratorium became a popular political measure with the majority, and an object of detestation to the minority.

There immediately arose in Kentucky a new political alignment; those favoring the moratorium being known as the "Relief Party," and the creditors as the "Anti-Relief Party." It was a situation to delight a demagogue; to dishearten a patriot. When the legislation was carried to the courts, a political and not a judicial decision was looked for. The great majority of the people honestly favored the relief laws and conscientiously believed that a Legislature representing the popular majority had the power to enact such laws. They had heard so much talk of the republican form of government, of rule by the people, and of bowing to the will of the majority, that it came as a shock to the simple average citizen to learn that the three unassuming gentlemen who constituted the highest Court of Appeals in the State of Kentucky had to pass upon the constitutionality of these laws before the will of the majority enacting them could constitutionally prevail. The cases of Blair vs. Williams, and Lapsley vs. Brashears (4 Littell's Reports, 34, 46, 65) were fought through the various courts, despite the discontent and mutterings which grew to open threats of what would happen if the popular will were reversed. Finally, in 1823, the Court of Appeals, through the opinion of its Chief Justice, declared that the clause in the Federal Constitution forbidding a State to pass any law impairing the obligation of contracts made this moratorium unconstitutional. Then the storm broke.

The wildness of the political outburst for which this decision was a signal, has probably never been surpassed. "Usurpers," "tyrants," "self-made kings" were some of the epithets cast at the judges. Their power to declare a legislative act unconstitutional was impugned. They were attacked personally with bitterness and violence. The press, the stump and the legislative halls rang in their denunciation. There were demands for the recall of the judges. The recall of the decision would have doubtless likewise been demanded had any demagogue yet invented that nostrum. Finally, it was determined to recall the entire court.

Resolutions were introduced in the Kentucky Legislature condemning the court's decision as "ruinous to the good people of this Commonwealth, and subversive of their dearest and most invaluable political rights," and announcing the doctrine that the courts were without power to determine the constitutionality of a legislative enactment, but that only the Legislature, not the Appeals Court, should have the power to repeal legislation. Nevertheless, on top of these denunciations and resolutions, the court calmly denied a rehearing of its decision.

The Legislature then sought the removal of the judges by impeachment. Since no tenable ground therefor existed, this proved futile. Their removal by address to the Governor was made a political issue for the campaign of 1824. It was a campaign of unparalleled bitterness and vituperation. Partisanship personified in Governor Desha carried overwhelmingly. The Relief Party summoned the judges to show cause before the Legislature why they should not be removed. Tension was at its height. The outbreak of actual violence menaced on all sides, but the members of the court, by their calm and dignified reiteration before the General Assembly of the logic of their opinion, sustained the courage of their few supporters. While the resolution for the removal of the judges by address carried the House by a large majority, it lacked the necessary two-thirds vote.

The State Senate then sought to recall the entire court. The court had been organized by legislative enactment under constitutional direction, but it was a Constitutional Court, and not of legislative creation. Nevertheless, the Senate proceeded to repeal the act organizing the Court of Appeals. Having done so, it re-enacted a similar law, thereby seeking to establish a new Court of Appeals. These tactics wrought upon the already tense issues to the very point of conflagration. The minority fought fiercely, but were overwhelmed. The Relief Party proclaimed their victory by dis-establishing the court through their Repeal Bill, and organizing a new court favorable to the moratorium.

None the less, the stalwarts who had constituted the old court maintained the entire proceedings unconstitutional. They argued clearly that the attempted dis-establishment, if upheld, would permit a bare majority of the Legislature to do what the Constitution required a two-thirds vote to accomplish. They pointed out that this attempt by indirection to do what could not be done directly, was contrary to the intention of the Constitution, and therefore void. Firm in their consciences, the old court stood by what it believed its duty, and continued to hear and decide cases. Kentucky found itself in the fantastic situation of having two Supreme

Courts, each announcing its own authority, and each declaring the acts of the other invalid.

The political alignment now changed to that of the "Old Court Party," and the "New Court Party." In 1825, upon the issues thus indicated a new campaign was fought. In the meantime, however, the weight of intelligence in the community had been thrown to the favor of the Old Court Party. The great, quiet influence of reputable members of the bar allayed the excited passions of the mass of the people. Almost without exception the more worthy members of the legal profession upheld the old court, and brought their cases to its tribunal for decision. The people, on the other hand, saw the partisan and gang element in politics resorting to the new court. Demagogues tried in vain again to ignite the already exploded passions of popular prejudice. The old court party came out of the campaign with a large majority in the Legislature. Their positions reversed, the factions renewed the fight, but by the time the Legislature adjourned the new court had ceased to do business. Finally, on the last day of the year 1826 salaries were voted to the courageous old judges who had sat and served through such difficult times, without remuneration other than their untroubled consciences.

INDUSTRY, COMMERCE AND FINANCE

Postal Bank Deposits in the United States.—According to a paragraph in a recent issue of the New York "Times" there are now 9,653 Post Offices that are postal savings bank depositories. New York City, with $5,366,544 on deposit at the end of August, leads all offices in postal savings deposits. Deposits for the whole country at the end of August, according to an announcement made tonight, amount to about $48,000,000. The New York office, with an increase of $926,842 in August, made the largest gain for the month. The average daily receipts in New York during August were approximately $50,000.

Final figures are not yet available for Brooklyn and San Francisco, but data available would indicate increases of $285,000 and $65,000, respectively. The accounts of the system, audited to include June 30, 1914, showed $43,444,271 to the credit of depositors on that date.

The balances on deposit June 30 in the several States, the District of Columbia and island possessions, are as follows:

New York, $7,593,289; Ohio, $3,670,982; Illinois, $3,596,470; Pennsylvania, $3,266,473; California, $3,074,345; Massachusetts, $2,085,856; Washington, $1,599,853; Missouri, $1,520,185; Minnesota, $1,508,363; Michigan, $1,483,721; Oregon, $1,341,489; Colorado, $1,112,223; New Jersey, $1,075,021; Wisconsin, $1,068,379; Indiana, $1,044,193; Montana, $755,761; Connecticut, $683,838; Kansas, $665,532; Texas, $557,946; Nevada, $382,367; Kentucky, $360,161; Nebraska, $358,760; Rhode Island, $358,233; Iowa, $344,790; Idaho, $338,446; Oklahoma, $303,273; New Hampshire, $293,841; Arizona, $291,960; District of Columbia, $263,978; Tennessee, $251,554; Louisiana, $212,621; Florida, $212,534; Maine, $207,789; Virginia, $196,159; Arkansas, $153,120; Mississippi, $152,835; Utah, $152,049; West Virginia, $121,141; Alabama, $114,890; Wyoming, $110,562; Maryland, $95,426; Georgia, $73,951; New Mexico, $72,831; Vermont, $61,192; South Dakota, $60,715; Delaware, $50,049; North Carolina, $39,778; North Dakota, $37,745; Porto Rico, $27,284; South Carolina, $20,923; Hawaii, $19,395. Total, $43,444,271.

Money Circulation in the United States on October 1, 1914.—The Treasury Department's monthly statemen of the money in circulation and of the total stock of money in the United States, shows that October 1 the total amount of money in circulation was $3,694,748,196, as compared with $3,478,603,792 on September 1,—an increase of $216,144,404 for the month. The general stock of money in the United States on October 1 was $4,037,735,626, as compared with $3,819,916,263 on September 1,—an increase of $217,819,363. During the month of September there was an increase of $17,235,582 in the country's stock of gold and an increase of $200,344,495 in the amount of bank notes (including emergency currency). The per capita circulation of money in the United States on October 1, 1914, was $37.15, as compared with $35.03 on September 1, 1914; $34.48 on September 1, 1913; and $34.36 on September 1, 1912.

The following tables show the amounts of the various kinds of money in circulation and the general stock of the same on September 1, 1914, with comparisons for previous months and years:

MONEY IN CIRCULATION.

	Sept. 1, 1914.	Oct. 1, 1914.	Oct. 1, 1913.	Jan. 1, 1879.
Gold coin	$627,104,376	$657,944,193	$610,735,030	$96,262,850
Gold certificates†	944,622,551	931,390,259	1,029,828,159	21,189,280
Standard silver dollars	70,819,085	70,724,311	73,284,490	5,790,721

The Truth as to the Latin-American Commercial Situation.—Director General John Barrett, of the Pan-American Union, has found it necessary, on account of the wide interest in the United States, to ascertain by cable the exact business situation in Latin-America. On August 8, immediately after the outbreak of the European War, Director Barrett addressed a memorandum to the commercial and financial interests of the United States urging them to prepare to meet the combined responsibility and opportunity presented in Latin-America by the war. This statement attracted general attention and discussion, but now a new phase of the situation, as indicated by these cable reports, has developed and is requiring careful consideration.

"These advices," states Mr. Barrett, "emphasize that what is needed at this hour in Latin-America is not so much a supply of the manufactured products of the United States, although required in considerable quantities, but money loans and advances, credits on purchases, and markets at reasonable rates for raw products which usually go to Europe. If Latin-America can sell at a fair figure her accumulating raw products and buy, in turn, through receiving

financial help and co-operation in the form of advances and credits from United States exporters, importers and bankers, the situation will be speedily remedied and the commercial interests of the United States and Latin-America will truly enter upon a new era of Pan-American commerce and comity.

"The fact that the twenty Latin-American countries last year bought imports and sold exports to the vast total of $3,000,000,000, of which $2,000,000,000 were transactions with Europe proves beyond quibble or doubt that the opportunity is there but subject to the conditions herein noted. That the United States already has a good start and is making encouraging progress is shown by the fact that its exchange of trade with Latin-America has grown in the last seven years, or during the present administration of the Pan-American Union, nearly 100 per cent, or from $450,000,000 to $850,000,000.

"The European War, while greatly lessening the sources of Latin-American imports and the market for exports, and opening a corresponding greater opportunity to United States exports and imports, has so unavoidably crippled Latin-American financial resources and commercial machinery that it must require several months or a year before conditions can readjust themselves and permit results that many United States business men expect immediately.

"Despite the efforts not only of the Latin-American Embassies, Legations and Consulates, but of the Pan-American Union, as an international organization, and the United States Departments of State and Commerce to state the situation exactly as it exists, countless articles have been appearing in various newspapers and magazines emphasizing an alleged 'golden opportunity' without pointing out its actual and present environments of money tightness and dislocation of international commercial methods. Numerous business men and commercial agents, in consequence, are crowding the steamers bound for Latin-America with the expectation that they will find the Latin-Americans awaiting them with outstretched hands filled with gold and ready to buy everything and anything they have to sell. These men will presently return to the United States and unfairly condemn and criticise the markets and peoples of the countries visited.

"A great stream of letters and telegrams from both North and South America are daily pouring into the office of the Pan-American Union, as the international American bureau of information, and they prove the widespread interest in the field and opportunity, but they are invariably answered not only with the statement of the actual opportunity but with an admonition that the Latin-American market, while vastly potential, is at this moment embarrassed by a serious financial stringency and dislocation of commercial conditions, for which it is not in itself to blame.

"The opportunity of the hour, therefore, in a word, is not so much one for immediate large sales of United States manufactured products as one for co-operation and mutual help, together with careful investigation of commercial conditions and preparation to meet future competition successfully."

Passenger Service Deficit on United States Railways.—The Bureau of Railway News and Statistics has issued the following:

Twenty-one years ago more than one-third of the railway mileage of the United States was carrying its passenger business at a loss. Taken in conjunction with the recent decisions of the Interstate Commerce Commission in both eastern and southwestern rate cases, finding present State enforced passenger fares unprofitable and ruling that the railways need not apply to interstate traffic the excessively low rates forced by State legislation, figures taken by the Bureau of Railway News and Statistics from early reports of the commission show that at least for a quarter century the passenger traffic of the United States has either resulted in actual loss to the carriers performing the service or has failed to contribute its proper share to railway revenues.

The commission's recent decision, therefore, is seen as the result not of a recent development in passenger traffic, but of the fact that American passenger fares never have been adequate to the expensive quality of service demanded by Americans.

For six years after its creation the commission compiled figures showing not only the average revenue received by the railways for carrying one passenger one mile, but also the average cost of performing the service. For these six years the revenue, cost and difference in cents per passenger mile are as follows:

Year.	Revenue.	Cost.	Difference.
1888	2.349	2.042	.307
1889	2.165	1.993	.172
1890	2.167	1.917	.250
1891	2.142	1.910	.232
1892	2.126	1.939	.187
1893	2.108	1.955	.153

Taking these costs of a quarter century ago it may be seen how slight could be the profit to-day, when the average revenue has declined to 2.01 cents per passenger mile, forced upon the railways by State legislation, while all elements of cost, particularly labor, fuel, equipment and terminal facilities, have risen enormously.

By 1893, in fact, when the commission abandoned the computations, the railways in four of the ten territorial groups were shown to be carrying passengers at a loss. The deficits for these groups for the several years follow in fractions of cents per passenger mile:

Group.	1890.	1891.	1892.	1893.
V	*.388	*.217	*.089	.146
VII	*.063	.093	.283	.151
VIII	.026	.176	.212	.250
IX	.153	.057	.133	.050

*Net profit.

Thus in 1893 there was an average loss for every passenger carried by the railways of Georgia, Florida, Alabama, Mississippi, Tennessee, Kentucky, Louisiana, Arkansas, Southern Missouri, Oklahoma, Indian Territory, Kansas, Nebraska, Western North and South Dakota, Montana, Wyoming, Colorado, Eastern New Mexico and Texas. These railways, paying more to furnish the passenger service than they earned from the service, operated 58,843 miles of the 169,780 for the entire country, or almost 35 per cent.

To-day American railways furnish the highest class passenger service in the world at a price as low as, or lower than that charged by any of the railway systems of Europe in their first-class tariffs, even disregarding the much greater value of the American cent in these foreign countries. The comparative cheapness of American travel is shown more truly in the length of journeys purchasable by an average day's labor, the wage taken being that of railway employes:

	Average Wage. Per Day.	Average Receipts First Class Per Passenger Mile.	First Class for Day's Labor.
Switzerland	$0.99	*3.26 cents	30.4 miles
Great Britain	0.93	*3.00 cents	31.0 miles
Italy	1.15	*3.52 cents	32.7 miles
France	0.87	2.12 cents	41.0 miles
Belgium	0.85	2.01 cents	42.1 miles
Germany	1.35	2.93 cents	46.1 miles
United States	2.49	2.01 cents	123.9 miles

Tariff rate.

One day's labor in the United States purchases thus almost three times as much travel as would the same labor traveling first-class in the nearest European competitors above.

INSURANCE

Articles on the Theory, Practice and Experience of Insurance.

Notes on Insurance, American and Foreign.

Items of Insurance News.

IT is probably accurate to say that never before in the history of insurance in the United States has insurance education received the attention that is being given to it to-day. It would appear that there is working in the entire body of persons engaged in the insurance business the leaven of desire for more exact knowledge on their own part and of comprehension that the great public which buys insurance, legislates about it and regulates it has an interest in knowing more of it than the mere premium rates at which it may be purchased. Hence the theme of insurance education is becoming a constant one at insurance meetings and conventions. It is attacked from many points of view and with many different aims. Let a survey of all the activities in this field and a study of all the pronouncements upon the subject make it clear that the world of insurance is convinced that rules-of-thumb, derived from a few and applied by the many, are no longer sufficient either for the inner requirements of the profession or for keeping the public at large properly informed about something which vitally concerns it. American devotion to business, in the narrower sense of the world, has been responsible in the past for no small part of the misunderstandings that have arisen between particular businesses and the rest of the community who need the services of these businesses and yet are not quite covinced that they are not being taken advantage of by them. It is a singular trait in human nature that very large numbers of persons are confident that they are above criticism in their conduct of the particular matters from which they make their living, and yet are quick to be suspicious of their fellows in another branch of affairs. Hence business men outside of the insurance business have not been slow to lend their aid to movements, legislative or other, directed against insurance, and this more from ignorance than from malice. On the other hand, insurance men as a class have far too often found themselves in the position of knowing much too little about the fundamentals of their occupation, and have put up hardly more than a show of defense when they and their business have been attacked. More than this, the very leaders of insurance themselves, men whose knowledge is necessarily much broader than that of the rank and file, have been more and more coming to recognize the larger implications of their business, in its general relations with the body politic, and at the same time to feel the want of continuous additions, both general and technical, to what they know.

The impulse to insurance education, which has been spoken of above, is the result of the confluence of all these influences. On the one hand, insurance men of all classes are seeing the advantage of penetrating more and more intimately the subject matter with which they deal, of investigating it more closely and minutely, and of developing more fully all its possibilities. The German scientific thoroughness in the study of the theory and practice of insurance is less and less looked upon as unnecessary and superfluous. When new insurance problems come up and a solution of them is speedily called for,—as, for instance, the problems of workmen's compensation insurance,—insurance men are decidedly more embarrassed than they once were at having to admit that they have not accumulated any preliminary information about them and can be of little immediate service in dealing with them. And, on the other hand, repeated disappointments with legislatures and other bodies representing the public, have brought it home to insurance men that they must find means to pass along to the thinking part of the community as a whole the essentials of their own knowledge. They need the instructed co-operation of all who are intelligently interested in the service which insurance is rendering to society; hence they must continually strive to gain their attention with sound information so put as to carry its own intellectual and social appeal with it.

An interesting and convincing illustration of what has just been said is to be found in the fact that at the joint convention of the International Association of Casualty and Surety Underwriters and of the National Association of Casualty and Surety Agents, held at White Sulphur Springs, Va., two weeks ago, the addresses of the respective presidents of the two associations, Mr. Charles H. Holland and Mr. Wade Fetzer, were both devoted in the main to this theme. Perhaps Mr. Holland laid the greater stress upon the need of self-education for insurance men themselves, as a prerequisite to educating the public; while Mr. Fetzer dwelt rather upon the advantages of co-operative organization in the great body of those making insurance their life-work, to the end that they may acquire as large as possible a stock of common knowledge, on the one hand, and reach the public effectively with this knowledge, on the other. But whichever side of the matter was emphasized by each of them, both Mr. Holland and Mr. Fetzer were arguing for more and sounder knowledge in the field of insurance, and for the bringing of this knowledge home to the great public which is the final arbiter of all businesses and all social activities.

Two other pertinent illustrations of this "Drang nach Wissenschaft, impulse towards knowledge," as the Germans would call it, among our insurance men may be found in matters of recent occurrence. The first of these is the résumé recently given by Dr. Harry Toulmin, of the Penn Mutual Life Insurance Company, of the work that has been done and of the results so far attained, in the great co-operative medico-actuarial investigation which has been under way for the past three years. The immediate object of the medical examiners and actuaries of the various companies participating in the research is, of course, technical, i. e., the construction of a new mortality table based on physical and occupational classifications, instead of upon age alone. At first blush, it might be thought that here is matter with which the public, and even the rank and file of life insurance men, will not and need not concern themselves. But even a hasty glance at the preliminary results, as set forth by Dr. Toulmin, is enough to show that a great fund of exact knowledge is being arrived at, and that the comprehension of it will reach far in many directions.

The second illustration alluded to is the organization of the Casualty Actuarial and Statistical Society of America, just reaching completion. Here we have an association intended to be promotive of sound knowledge in the vast and almost unmapped field of casualty, accident and similar forms of insurance. Its aims are not technically and narrowly actuarial and statistical, and it is to include many casualty insurance men all over the country who have not yet won their spurs as actuaries or statisticians. But the very name of the new association shows that what is had in view is the acquisition and dissemination of sound knowledge. Hence it should be a powerful coadjutor in the great work of making American insurance impressive not only for the magnitude of the business it does, but even more for its mastery of the sum-total of knowledge on which that business rests.

A STUDY OF THE LOSS OF LIFE IN BATTLE

THE reports of battles in the present war in Europe suggest that the loss of life has been in excess of anything previously recorded. Nothing entirely accurate can be stated as to the present campaign. It is quite possible, however, that the early reports will prove excessive. It will be interesting, in any event, to arrive at an accurate idea of the records of past wars with a view to establishing a basis of accurate comparison when the records of the present war become available.

There is no more difficult subject to treat with entire accuracy than mortality in battle. The operations are essentially rapid, and the system of records is necessarily subject to the excitement and unsettled condition out of which the record must be developed. It is a far simpler matter to make up an approximately accurate list of "casualties," covering the dead, wounded, and missing, than it is to fix upon the proportionate numbers of each, or to determine the number killed on the field of battle, the number dying of wounds, and the number dying as a result of disease.

The records of losses in our Civil War are far more accurate than any others we have for such extensive operations; and even here the record is less accurate for the South than for the North. Three hundred and fifty-nine thousand, five hundred and twenty-eight Union soldiers were killed in battle, or died of wounds. It is stated that nearly 150,000 died of disease. Careful investigations indicate an equally large loss on the Confederate side with a considerably smaller force in the field. The generally accepted total, for both sides, is a loss in deaths of 1,000,000 men. The death-rate in particular battles was accurately recorded. This, of course, does not include subsequent deaths from wounds. An interesting table has been compiled by "Field Notes," the agency publication of the Northwestern Mutual Life Insurance Company, in which the percentage of losses in certain Civil War battles is compared with the expectancy of life at various ages:

DEATH RATE COMPARED WITH LIFE RISK IN FOURTEEN CIVIL WAR BATTLES.

Battle.	Death Rate Per 1,000.	Equivalent Risk in Life.	Battle.	Death Rate Per 1,000.	Equivalent Risk in Life.
Nashville	14.8	52 to 53	Antietam	39.7	40 to 44
Fredericksburg	18.1	55 to 56	First Bull Run	40.7	26 to 31
Chancellorsville	20.3	42 to 44	Shiloh	42.2	30 to 35
Chattanooga	20.5	42 to 44	Spottsylvania	44.3	33 to 38
Seven Days	27.1	36 to 39	Chickamauga	47.6	23 to 29
Wilderness	31.2	42 to 45	Stone's River	50.0	47 to 51
Cold Harbor	33.0	28 to 32	Gettysburg	55.5	49 to 53

It will be seen from this that a soldier at Gettysburg, for example, had the same chance of coming through the battle alive as a man forty-nine years of age has to live to be fifty-three. Every soldier at Shiloh had the same chance of escaping alive as a man of thirty has to live to be thirty-five. These figures would appear to suggest that losses in battle are considerably below the estimates popularly held.

Such figures, however, are very likely to be misleading, unless clearly understood. For instance, these figures represent loss percentages of from 1.5 to 5.6 of the forces engaged. But they do not include, as already pointed out, subsequent far greater losses due to wounds and disease. Thus a statement of casualties gives a much fairer idea of the actual losses incurred. In a recent issue, the London "Times" gives the following list of British losses in several notable battles, in which the loss percentages vary from 15 to 48:

KILLED, WOUNDED AND MISSING IN FIVE BATTLES.

	Year.	British Troops Engaged.	Casualties.	Per-centage.
Talavera	1809	20,500	6,250	30
Albuera	1811	8,200	3,990	48
Waterloo	1815	23,991	6,932	29
Chillianwallah	1849	15,000	2,388	15
Inkermann	1854	7,464	2,357	31
Average				31

An English military authority places the British losses in killed and wounded alone in nineteen principal battles during the past 150 years at 19 per cent.

Probably the most exhaustive treatise by a layman on the subject of war losses is a book by M. Gaston Bodart, "Militar-historisches Kriegs-Lexikon," published in 1908. Mr. Bodart brings out fully the impossibility of mathematical accuracy in the treatment of his subject; but he has been able by an extraordinary research and sifting of the authorities, to satisfy himself as to the substantial correctness of his figures. He states that between 1618 and 1905 there were in Europe 1,166 engagements, 1,044 on land and 122 on sea, in each of which over 2,000 men were killed. He gives a complete list of battles in which the losses were at least 30,000 on both sides, killed, wounded or missing, with percentages to the total number engaged. We have selected the following list as the most generally familiar:

CASUALTIES (KILLED, WOUNDED, MISSING) WITH PERCENTAGE OF LOSS IN NINE GREAT BATTLES.

Battle.	Total Number Engaged.	Casualties.	Per Cent.
Koniggratz	435,000	54,000	12.4
Mukden	624,000	138,000	20.5
Wagram	290,000	63,000	21.7
Gettysburg	158,000	45,000	28.4
Plevna	163,000	50,000	30.6
Austerlitz	148,000	46,000	31.1
Borodino	246,000	80,000	32.5
Waterloo	192,000	65,000	33.8
Sedan	320,000	122,000	38.1

Here again there must be caution in stating the figures, because of the varying element of prisoners. Casualties repesent a fair basis for judging the immediate damage inflicted upon the enemy's fighting strength. But at Waterloo the killed and wounded numbered nearly 45,000, out of a total loss of 65,000, while at Sedan there were only approximately 26,000 killed and wounded out of a loss of 122,000.

A very full study of losses in war was made by M. Paul Leroy-Beaulieu, and published by the London Peace Society in 1869. It covers the wars of the world between 1853 and 1866, and goes into more detail with regard to the separation of the various items on the casualty list than any book we have seen. His figures for the Crimean War bring out strongly our point that the actual losses of war cannot be based, or even approximately based, upon the figures covering the men actually killed in battle. M. Leroy-Beaulieu states that in all the armies involved in that war, 53,007 were killed, and 731,984 died from wounds or disease, a total of 784,-991. He gives as the total loss of life in the wars of the fourteen years covered by his study, 1,743,491, and the total cost, direct and indirect, but due to war during that period, $9,565,000,000.

The material available at the time when M. Leroy-Beaulieu made his investigations has been considerably augmented by subsequent research, and there can be no question of the unique interest which attaches to a table appended as a note to the classic life of Stonewall Jackson by Lieut. Col. G. F. R. Henderson, formerly Commandant of the Staff College in England, and an author of recognized authority on the science of war. Col. Henderson's figures cover eighty-six important battles in all countries, from Blenheim in 1704 to Tel-el-Kebir in 1882. The great value of the record lies in the fact that it covers losses in killed and wounded, and eliminates the uncertain element of missing men.

Of the eighty-six battles listed the highest percentage of loss occured at Zorndorf in 1758, where 32,760 Prussians defeated 52,-000 Russians, a total of 84,000 men, of whom 32,000, or 38 per cent, were killed or wounded. The greatest numerical loss listed took place at Leipsic, in 1813, where 290,000 Allies defeated 150,000 French, a total of 440,000, of whom 92,000, or 20 per cent, were

killed or wounded. The average proportion of killed and wounded in eighty-six battles was 15 per cent. It is interesting to note that the percentage of losses sustained by the victors in these battles averaged 13 per cent. In only 13 of the 86 was the percentage of the victor's losses greater than that of the defeated army, and in 8 of these the victorious troops were German, a fact not without its suggestiveness in view of the reports of recent German methods of attack. Of the remaining 5 battles out of the 13 referred to, 3 were the Confederate victories of Sharpsburg, Chancellorsville, and the Wilderness.

For purposes of information and reference we tabulate below a list of 20 battles, selected from Col. Henderson's compilation, in which the number of killed and wounded was at least 25,000. It should be noted that an accurate idea of losses cannot be had from the percentage figures alone. These indicate the severity of the contest and of course decrease in proportion as the relative numbers engaged increase. With the vast armies now engaged in Europe the percentages of killed and wounded may conceivably prove to be comparatively low. It may be mentioned that these figures do not include deaths from disease. Such deaths are of course to be included in figures covering war mortality, but they are rarely available, and fortunately are being constantly reduced.

LOSSES IN KILLED AND WOUNDED IN TWENTY BATTLES SHOWING GREATEST FATALITIES, BETWEEN 1704 AND 1882.

Battle.	Date.	No. Engaged.	Killed and Wounded.	Per-centage.
Leipsic	1813	440,000	92,000	20
Borodino	1812	262,000	75,000	28
Aspern	1809	170,000	45,000	26
Wagram	1809	370,000	44,000	11
Eylau	1807	133,500	42,000	33
Waterloo	1815	170,000	42,000	24
Gettysburg	1863	163,000	37,000	24
Chickamauga	1863	128,000	35,100	27
Friedland	1807	142,000	34,000	23
Malplaquet	1709	200,000	34,000	17
Vionville	1870	168,000	32,800	19
Zorndorf	1758	84,760	32,000	38
Solferino	1859	295,000	31,500	10
Blenheim	1704	116,000	31,000	26
Kunnersdorf	1759	113,000	31,000	27
Gravelotte	1870	320,000	30,000	9
Königgratz	1866	317,000	26,894	6
Wilderness	1864	179,000	26,000	14
Austerlitz	1805	148,000	25,000	16
Spottsylvania	1864	150,000	25,000	16

THE TENDENCIES OF SOCIAL INSURANCE

AN article in a recent number of the Fidelity and Casualty "Bulletin" brings out most clearly that, as the United States has followed the lead of the world's older countries in the adoption of the workmen's compensation principle, so the tendency is to follow also in the various other branches of the great whole of social insurance. The first workmen's compensation law in the United States (that of the United States Government compensating injuries to certain Government employes) was approved May 30, 1908. In the following year a compensation law was passed by the State of Montana, but was declared unconstitutional, and in 1910 two laws were passed in New York State, one of which (the compulsory) was later declared unconstitutional and the other became a mere dead letter on the statute book of the State. Thus it was not until 1911 that workmen's compensation became an established principle in the State laws of the United States. In that year no less than ten State workmen's compensation laws were passed, and from that year may be dated the popular adoption of the compensation idea in this country.

Now a glance at the record of some of the European countries. Measures for the insurance of workingmen against industrial accidents appear to have first found legislative expression in Europe in 1868, when a compulsory law for the indemnifying of miners accidentally injured was passed in Belgium. It was not until 1884, however, that a comprehensive system of accident compensation on a national scale was adopted, and then by Germany. Other countries took up the principle in the following order: Austria, 1887; Norway, 1894; Finland, 1895; Great Britain, 1897; Denmark, 1898; Italy, 1898; France, 1898. The next law was not passed until 1900, by Spain, after which nations all over the world have adopted the idea, and, at the close of 1913, thirty-five countries, including the United States, had compensation laws on their statute books.

The introduction of sickness insurance abroad was practically contemporaneous with that of accident insurance, but it is a noticeable fact that, except in Germany and Austria, practically every sickness insurance law is of a voluntary nature, whereas accident insurance, in almost every instance, was originally or at a later date was made compulsory. This would seem clearly to indicate that the necessity for sickness insurance was not felt to be as great as for accident insurance, and probably accounts for the fact that accident insurance only has been introduced into this country.

Invalidity insurance, old age pensions, and unemployment insurance are later developments of the social insurance scheme and have been far less widely adopted. But there seems little doubt that their principles have permanently taken root abroad and that their ultimate scope, in some form or other, will be as wide as that of the accident insurance principle.

Our point, however, is this: Although workmen's compensation for industrial accidents became permanently fixed in Germany by 1884 and was extensively adopted throughout Europe by 1898, it did not become an actual part of our State legislation in the United States until 1911,—a gap of at least thirteen years. But it has been incorporated now, most surely and permanently. Is there reason to think that the incorporation of the other forms of social insurance is less sure to come after an equal or even a shorter space of time? The evidence is all to the contrary. We are glad to print below what the Fidelity and Casualty "Bulletin" has to say on the subject.

* * *

Fifteen years ago it was self-evident to the thinking liability insurance men in this country, that workmen's compensation insurance was bound to become an established institution. Unfortunately, such men constituted a very small minority of those engaged in the business of liability insurance. The others closed their eyes, and declined to see that social betterment must come in this country just as it had in Europe. Instead of conducting an educational campaign for the enlightenment of the employers and employes, the liability insurance managers as a rule permitted the matter to drift along to take what course it might. When workmen's compensation insurance did come with an overwhelming impetus, neither the employers nor the liability insurance men were able to direct its course.

To-day, how many liability insurance managers have even thought of the other branches of social insurance? How many liability insurance company managers have considered for a moment the effect on workmen's compensation insurance when State after State takes up the great question of introducing sickness insurance, unemployment insurance, invalidity and old-age pensions?

Instead of leading in the matter of studying social insurance, the liability insurance managers are drifting along as they did fifteen years ago in relation to workmen's compensation insurance. There is one association that is determined to be forehanded—the

National Association of Manufacturers. The Board of Directors of that body adopted the following resolution May 21, 1914:

"It is moved, seconded and ordered that Messrs. Schwedtman and Miles be requested to collect and report at the July meeting of the Board information on Sick and Unemployment Insurance with recommendation as to a course of Action by the Association and a budget for investigation and collection of information."

A preliminary report was submitted by Mr. F. C. Schwedtman to the Board under date of July 1, 1914. In this report Mr. Schwedtman demonstrates clearly that the burden of real constructive work must be undertaken by the employers of this country; that the people of this country will follow the natural evolution of social insurance in Europe.

In relation to sickness insurance he says:

"I give it as my opinion that Sickness Insurance of some kind, with compulsory contribution on the part of employers, will be enacted into law by many States of the Union within the next five years, and that now is the time to go into this subject thoroughly and carry on an educational campaign such as we have been carrying on in connection with Workmen's Compensation Insurance and Accident Prevention."

As to unemployment insurance, his statements so clearly indicate the trend in this country that it is advisable to quote his views in full:

Unemployment Insurance.

"This type of Social Insurance is of much more recent origin than Sickness, Accident, Invalidity, or Old Age Insurance. It is nevertheless a fact that Unemployment Insurance is being discussed more widely in the last few years than any other style of Social Insurance.

"Let me quote from a recent report on unemployment:

'Sixteen nations and 130 cities were represented at the first general Unemployment Congress convened at Ghent during the second week of September last. The Association was organized at Paris three years ago. * * *

'In the three years' interval the membership has increased to more than 1,000 contributors, one-third of them official bodies, States, provinces, towns, labor exchanges, trade unions, employers' associations, etc.

'The City of Ghent took up unemployment insurance during the year 1900. More than a million francs have been expended in the twelve years during which the plan has been in operation and the taxpayers of Ghent feel well satisfied with the result.

'Thirty towns in Belgium have followed the example set by Ghent; twenty-five in Holland, twenty-five in France, ten in Germany, three in Italy, and two in Switzerland, and the Ghent idea—public aid to voluntary insurance—lies at the basis of the national schemes for Insurance against Unemployment, which recently became law in Denmark, Norway and Great Britain.'

"There was a national gathering called to consider Unemployment in New York at the end of February this year, at which gathering there were representatives from fifty-nine cities and twenty-five States in the Union.

"I quote from the official records:

'In the course of the two days' discussion, despite the great diversity of viewpoints represented, five main points of agreement became clearly defined.

'These were:

'1st: The necessity for accurate labor market statistics.

'2nd: The necessity for widespread system of efficient labor exchange.

'3rd: The necessity for regularizing business.

'4th: The necessity for industrial training and vocational guidance.

'5th: The necessity for Unemployment Insurance.

'The United States Census for 1900 showed:

'Six million four hundred sixty-eight thousand nine hundred and sixty-four working people, or nearly 25 per cent of all engaged in gainful occupations, had been unemployed some time during the year. Of these, 3,177,753 lost from one to three months each, representing on the basis of $10 a week, a loss in wages of approximately $200,000,000.

'Two million five hundred fifty-four thousand nine hundred and twenty-five lost from four to six months' work each, representing a wage loss of approximately $500,000,000; and

'Seven hundred and thirty-six thousand two hundred and eighty-six lost from seven to twelve months' work each, representing a wage loss of approximately $300,000,000.

'Thus approximately $1,000,000,000 was lost in wages in the year.'

"In a report of the proceedings of this convention the following statement in the introduction is significant:

'In the interest of the general welfare we have penalized workers for working overtime. The question has been raised: Shall we penalize employers for working overtime?'

"In reviewing the insurance against unemployment in Norway, a prominent investigator recently stated:

'The Danes have demonstrated two economic truths:

'1st: That unemployment is the most frequent cause of pauperism.

'2nd: That insurance is the most effective remedy for unemployment.'

"England is the only country in which Compulsory Unemployment Insurance has been introduced:

'During the six months following January 15, 1913, payments on account of unemployment benefits to the number of 774,494 were made by the labor exchanges and authorized unions, amounting to $1,180,000 approximately, the claim allowed averaging $2.50 per week. The funds of Unemployment Insurance are gathered approximately one-third from the employer, one-third from the employe, and one-third from the State.

'Germany has not so far adopted Compulsory Unemployment Insurance, but nine dependencies of the Imperial Empire have voluntary Unemployment Insurance with the State contribution. Denmark, Luxemburg, France, Holland, Belgium, Switzerland and Italy have voluntary Unemployment Insurance systems providing contribution from the State.'

"I feel confident that Unemployment Insurance will have particular attention during the International Social Insurance Congress which takes place in Washington in 1915. Can and will we be ready at that time to give the viewpoint of enlightened American employers?"

Mr. Schwedtman's conclusions as to Invalidity and Old Age Insurance are:

"There is not a doubt in my mind but that Old Age and Invalidity Insurance will be agitated strongly in the various States of the Union during the next year or two. Consequently we should now devote our time and energy to a fuller inquiry of the subject."

In every country in Europe the State controls in some degree, sickness, unemployment, invalidity and old age insurance. Stock insurance companies have been absolutely excluded everywhere in the plans adopted for the three great branches of social insurance.

The stock insurance companies have been permitted in a number of States to write workmen's compensation insurance. In nearly every State where stock insurance companies have now the priv-

ilege of writing workmen's compensation insurance there has been a decided movement to eliminate them entirely.

When the great movement for the remaining branches of social insurance is in full swing in this country, will the stock liability companies be prepared to meet the large questions involved and demonstrate their right to do all branches of social insurance?

Will the stock insurance companies be able to demonstrate that they are capable of conducting all branches of social insurance economicaly and efficiently? Is the passive attitude the proper one to assume, or should we not accumulate a deeper knowledge of the problems that we have to confront than any other body or association in this country?

The answer is clear and self-evident. If the stock liability companies are unable to prove conclusively that they are the most efficient and economical source through which social insurance in all its branches can be conducted, then the State will take over all, not a part, of this great branch of insurance. This would mean that workmen's compensation insurance would be taken over by every State in the United States in conjunction with sickness insurance, unemployment insurance, invalidity and old age pensions.

THE RESPONSIBILITY OF A LIFE ASSURANCE COMPANY FOR THE ACTS OF ITS AGENTS

By Robert Thodey, F. I. A.

(Continued from Page 433)

NO legal penalty is imposed in England upon a company if its agents indulge in the pernicious practice of rebating, and although many would like to see it stamped out it is difficult to devise suitable legislative methods to secure that object. The Corporation of Insurance Brokers and Agents is, however, seeking to promote a bill in the English Parliament which proposes the punishment of an assurance company which, either directly or indirectly, allows rebates on premiums. While the Corporation is endeavoring to enforce registration of all agents, it does not appear, from the information at present available, that any penalty is to be exacted from an agent allowing a rebate. This is surely an omission, although, possibly, the council of the Corporation will, in the interests of their profession, exercise the necessary discipline over refractory members. The Commonwealth Secret Commissions Act 1905 hardly seems to touch on the point.

The Dominion of Canada, in the Insurance Act of 1910, while not actually penalizing a company for rebates allowed by its agents, has made a director, manager or other officer "who violates or knowingly consents to or permits the violation of the rebate section by an agent, etc., liable to a penalty of over £100. Whether this will have the desired effect, it is impossible to say, although it is contended that the knowledge that the Act contains this provision will tend to check the evil spreading in Canada.

An office conniving at the practice may, it is true, be free from legal responsibility, but it incurs a grave moral responsibility, inasmuch as no other practice is more likely to bring agency work in the life assurance world into disrepute. Business obtained by rebating is never so stable as that written honestly, while the cut-throat competition engendered among the agents themselves is detrimental to the best interests of their profession.

A typical case laying down that "companies employing agents are responsible for the libels on other companies, or their representatives, circulated in the course of their business," is found in Salvation Army Society Limited v. Pearl Life Assurance Company Limited (1908). An agent of the Pearl becoming dissatisfied at losing business to the Salvation Army Society, published, in leaflet form, an article denouncing the society, which appeared in the "Commercial World" in 1895. Before legal proceedings were taken the aggrieved society called the attention of the Pearl authorities to what was taking place. The latter promised to restrain their agent and issued instructions to that effect, which were apparently ignored. Whereupon, the society took proceedings and gained the day, the Pearl Company offering practically no defense.

Nearer at home we have Brown v. Citizens' Life Assurance Company (1894), in which the Privy Council affirmed a company's responsibility for the libels circulated by its agents, although the "agent" in this particular case was a superintendent of the company. The case is otherwise noteworthy as the terms "in the course of his employment" and "within the scope of his authority" were discussed by the learned members of the committee.

The latest case in Australia was Mutual Life and Citizens' Assurance Company Limited v. National Mutual Life Association of Australasia (1909), before the Supreme Court of Victoria. In the result this case was somewhat remarkable, since practically an alternative judgment was delivered. It was alleged that the defendants' agents circulated libels (originally published in certain newspapers) calculated to prevent people assuring with the plaintiff, but Mr. Justice a'Beckett expressed the opinion that "it is no part of an insurance company's business to depreciate other companies, that the company itself would not have done the class of acts involved in depreciating other companies, and therefore that company cannot rightly be held to have put the agent in its place to do them." The learned judge was possibly desirous of distinguishing between the action of a superintendent (as in Brown v. Citizens') and that of a canvassing agent, and it is therefore not surprising to find, on reading the whole of his judgment, a verdict for defendants proposed, but the latter having intimated that they were not prepared to face the possibility of a successful appeal by the plaintiffs, and the consequent heavy outlay for costs, judgment was company assuring the risk, and if such proposal contain inaccuracies the proponent is certainly responsible if the agent is unaware of the irregularities. How does the knowledge of the agent that the irregular answers have been inserted, either by himself entered for the plaintiffs. The case, like that of the Salvation Army Assurance Society, v. Pearl Assurance Company, mentioned above, had reference to a company's responsibility for the acts of its canvassing agents in publishing libels, and it is to be regretted, although perhaps not by the litigants, that a more decided result was not attained.

A couple of minor points may be mentioned before closing this paper:

(1) An agent cannot delegate his authority, and so cannot appoint sub-agents whose actions will be binding on the company employing him.

(2) An agent collecting money on behalf of his principal is required, subject to any established custom to the contrary, to see that the payment is made in cash. If otherwise, he may be liable for any checks or other negotiable instruments dishonored, while the debt is not regarded as discharged.

The second point is obviously handy in connection with industrial business.

In the course of this paper an endeavor has been made to indicate the directions in which life companies may be held legally responsible for the acts of their agents, but it cannot be said that the position is in any way too clearly defined. This will be apparent to any one who has the time and patience to peruse and consider the reports of the many cases decided in the law courts. Reports that reach the press are often very short, and so indirect, no doubt, the salient point is missed, so that decisions of what are

apparently identical sets of facts show unexplainable divergencies. In order to gain a more accurate insight into the subject, it is necessary to consult the fullest possible report of the proceedings, so that one may learn the exact position of affairs, and gather, if possible, what was passing in the mind of the judge when the case was being argued.

However important it may be that the exact responsibility of the company should be adequately defined, yet the greatest safeguard against irregular actions by agents is to be found in the exercise of a wise discrimination in the selection of men to fill the various positions. Life assurance agency work is an honorable profession, and all persons engaged therein should be trained and encouraged to demonstrate that they are the trusted servants of the company they represent, and to realize that any actions not strictly in accordance with a straightforward conduct of their business may not only involve their company in litigation, but will be derogatory to the dignity of their labor, and bring discredit on their profession.

As far as the office itself is concerned, much may be done by effective administration, especially in industrial insurance. The industrial agent himself is often a man unversed in financial matters, and, as a rule, he deals with people who, although doubtless experts in their trades, etc., are likewise not usually able to readily understand matters which to persons of a wider experience of the world are quite easy of comprehension.

Effective administration will include the careful selection of agents and close supervision of their work. Policy contracts will be put forward which do not lend themselves to misrepresentation, especially in dealing with the industrial classes. The writer has seen an industrial policy form, understood by the policyholder to represent an endowment assurance with full benefit throughout the whole term, which, only after careful scrutiny, revealed itself as a pure endowment, i. e., there was no death cover. Such a policy invites misrepresentation, and fosters misunderstanding, thus fastening on the office responsible for its issue no inconsiderable amount of odium and mistrust. In industrial work it is part of the superintendent's duty to ascertain, by careful inquiry of the proponent, that no misrepresentation of any kind has been made when the policy is first written, and also to keep a watch over policies already written, so that they may learn from time to time whether any representation has been made, or information supplied, which is not in accordance with the terms of the contract or the instructions issued by the office.

Many offices accept responsibility for acts performed by their agents in cases where it is very doubtful whether any responsibility attaches. While this is an evidence of liberality toward the assured, and shows that offices, as a rule, are averse to taking advantage of pure technicalities, yet it is a moot point whether it is always safe to give way, as, assuming the contract to be a plain one, easily understood, the company should not be asked to perform more than is promised in the policy itself. Instances have been reported in the insurance press in which companies have made good losses caused to policyholders by their agent's frauds, but for which the company could not in any way be called to account. I am not referring to these cases, but to those in which the company, although feeling that it is being over-reached, shrinks from the publicity of the courts and the glorious uncertainty of the law.

On the subject of errors and misstatements in the proposal I feel somewhat strongly, as the law seems in a more than usually unsatisfactory condition. There are conflicting decisions as to the company's responsibility for misstatements in a proposal which has been filled in by an agent, there being a pronounced tendency to hold any policies so obtained valid, and to deny the companies relief. This, in my opinion, is unjust. If the agent is informed of an unfavorable answer to what he knows to be an important question, and, practically, arranges with the proponent that a favorable, or at least a colorless, answer shall be inserted instead of the truth, surely that agent has ceased to be the agent of his company in respect of that particular transaction. On the whole, I favor Biggar v. the Rock Life, as dictated by sound common sense, and as being in accordance with accepted business principles. To hold that, when a man of intelligence signs a statement containing inaccuracies, the company shall be liable because those inaccuracies were inserted by its agent when he had full knowledge of the truth, seems the height of absurdity. How can the knowledge of the agent be the knowledge of the principal when the agent goes out of his way to assist a third party to supply inaccurate information in a proposal for assurance, where, above all things, the utmost good faith in disclosing all material facts is essential? The position might be different if the proponent communicated the information to the agent on a document (not intended or not required to be submitted to the employing company) and the agent neglected to report to his principal the unfavorable information he had received. Here, obviously, disclosure would be made to the agent in such a way as would no doubt bind the principal. But a proposal for assurance is a document usually submitted to the officers of the or the proponent, alter the case, when that agent is obviously acting against the interest of his employers, and really in the interests of the proponent? The principal is often made responsible because he is not allowed to benefit by the fraud of his agent, but, in such a case surely the fraud is being committed for the benefit of the proponent, and has for its object the cheating of the principal.

Those interested will, no doubt, consult the various cases themselves, and it only now remains, in closing this paper, to acknowledge my indebtedness for some of the information supplied herein to the papers and legal notes of M. A. R. Barrand, F. I. A., and to Mr. Wendell M. Strong, the writer of "Legal Notes" in the Transactions of the Actuarial Society of America. Considering the interest attaching to all legal questions affecting assurance companies and their contracts, I would suggest that the Insurance Institutes of Australia might well make an interchange of information re local legal decisions, with criticisms thereon for publication, a feature of their Federal activities.

A considerable quantity of information re agents and their authority, etc., is contained in Macgillivray's Insurance Law, published in 1912. Had I known before starting how much that monumental work contains, I should have hesitated considerably before writing this paper.

NOTES ON INSURANCE, AMERICAN AND FOREIGN

New York Compensation Developments.—Last week witnessed two very definite developments as to workmen's compensation in New York. The first was an estimate by the Compensation Inspection Rating Board as to the July workmen's compensation premiums of the various liability companies (stock and mutual) doing that class of business in New York State. The estimate is based on the assessment of one per cent of premiums written which each company pays to support the Board. On this basis total premiums of $9,150,100 are indicated. This represents July business which was largely written for a period of six months. Taking into account the possibility of a wide margin of error in this calculation, it is conservative to say that premiums collected in New York by liability companies alone will amount to at least $20,000,000 this year.

This, of course, does not include premiums collected by the State Fund nor payments made and reserves put aside by the various employers in the State, most of them large, who have decided to carry their own risks. Obviously the first year's cost to the employers of New York through the compensation law is to be far nearer the approximation of Chairman Dowling of the Workmen's Compensation Commission,—namely, between $25,000,000 and $30,000,000,—quoted in this paper last June, than the estimate of Superintendent of Insurance Hasbrouck, made this week in his report to Governor Glynn on the progress made in inspection of factories under the workmen's compensation law with the aim of preventing accidents and keeping down insurance rates. Mr. Hasbrouck said, in part:

"The total annual premium for compensaion insurance, according to the most reliable information, to be paid in this State will approximate $20,000,000. On the foregoing basis, the estimated reduction in premiums will exceed $3,000,000, and there is likely to be a further reduction in future premiums through cutting down the accident losses."

The second development of which we spoke above was the publication by the New York Insurance Department of rules and rates for the cancellation of long term casualty policies. The Department's ruling read as follows:

"It has come to the attention of this department that the short rate cancellation tables used by casualty insurance companies in this State, in connection with contracts written for periods longer than one year, produce earned premiums which are inconsistent with the earned premiums produced under like conditions on one year contracts. The premium charged the policyholder in such event is discriminatory, in that the long term contract holder is required to pay a greater amount of premium for the same protection than is required of the person who takes a policy for one year only.

"To correct this discrimination you are advised that from and after the receipt of this letter all cancellations of long term contracts when computed at short rates must produce the same amount of earned premium as if the policy had been written for one year. This, of course, applies only to the first year of the long term contract. For the remainder of the period the short rate percentage should be based upon an equitable sliding scale that will produce the entire earned premium at the end of the term for which the contract has been written. Speciment percentages applicable to certain periods within the policy term are inclosed with this circular.

Elapsed Time, Months.	$100 1-Yr. Premium. Per Cent Earned.	$270 3-Yr. Premium. Per Cent Earned.	Resulting Earned Premiums.
1	20	7.4	$20.00

Fire Losses in September.—The fire loss of the United States and Canada for the month of September, as compiled from the records of "The Journal of Commerce," shows a total of $14,383,050, a considerable reduction from the 1913 figures. The following table gives a comparison of the losses by months this year with those of the same months in 1913 and 1912, together with the monthly record for the balance of those years:

	1912.	1913.	1914.
January	$35,653,150	$20,193,250	$23.204,700
February	28,601,650	22,084,600	21,744,200
March	16,650,850	17,511,000	25,512,750
April	16,349,400	16,738,250	17,700,800
May	21,013,950	17,225,850	15,507,800
June	16,103,450	24,942,700	29,348,000
July	15,219,100	20,660,900	17,539,800
August	14,158,800	21,180,700	11,765,650
September	13,779,300	17,919,300	14,383,050
Total nine months	$177,529,650	$178,456,550	$176,706,750
October	$13,651,650	$14,932,750	.....
November	16,172,300	15,207,600	.....
December	17,967,000	16,126,450	.....
Total for year	$225,320,900	$224,723,350	.....

Infant Mortality in New York City.—The following paragraphs on the subject of infant mortality appear from a recent issue of the Weekly Bulletin of the New York City Department of Health:

"It has sometimes been suggested that the efforts of all organizations to prevent infant mortality consisted simply in keeping babies alive during the first year of their lives only to have them die during the second or third years. Without for a moment subscribing to this view, but merely in order to determine the facts in the case an investigation has been made of the deaths and death rates of the various age periods under one year, between one and two years, and between two and five years. The results of this investigation are given in the following table:

	Under 1 Yr.		Bet. 1 & 2 Yrs.		Bet. 2 & 5 Yrs.		T'l Under 5 Yrs.	
	No. of Deaths.	Death Rate per 1,000.	No. of Deaths.	Death Rate per 1,000.	No. of Deaths.	Death Rate per 1,000.	No. of Deaths.	Death Rate per 1,000.
1904	16,125	162	5,021	56.9	4,396	17.9	25,542	61.7
1905	16,522	159	4,294	47.2	3,723	14.7	24,539	57.3
1906	17,188	153	4,713	50.0	3,876	14.8	25,777	58.1
1907	17,437	144	4,493	46.1	3,864	14.2	25,794	56.2
1908	16,231	128	4,231	41.9	3,679	13.1	24,141	50.8
1909	15,976	129	4,740	45.3	3,803	13.1	24,519	49.8
1910	16,215	125	4,351	40.1	3,702	12.2	24,268	47.5
1911	15,053	112	3,878	34.4	3,311	10.5	22,242	38.6
1912	14,289	105	3,633	31.1	3,056	9.4	20,978	37.7
1913	13,780	102	3,703	30.5	3,228	9.5	20,711	36.2
Av'ge rate, 5 years, 1904—08 equals	.....	149.2	....	48.4	....	15.0	.....	56.8
Av'ge rate, 5 years, 1909—13 equals	.....	114.6	....	36.3	....	10.9	.....	42.0
Decrease, %	.....	23	....	25	....	27	.....	26

"A comparison of the five-year period from 1904 to 1908, i. e., previous to the establishment of the Bureau of Child Hygiene, with the five-year period from 1909 to 1913, shows that there is a decrease in the death rate of 23 per cent under one year, of 25 per cent between one and two years, 27 per cent between two and five years, and a total of 26 per cent in the death rate under five years of age. These figures show that the work which the Bureau of Child Hygiene and the allied agencies in New York City have been carrying on during the past five years has been highly successful. Its influence has extended not only through the first year of life, but throughout early childhood."

Workmen's Compensation in the English Law Courts.—Under the above head the "Insurance Journal and General Financial Record," of Manchester, England, gives a striking paragraph showing that the workmen's compensation law has not done away with ac-

cident litigation in Great Britain and that there is apparently no decrease in the number of cases arising under it. The paragraph is as follows:

"Legal problems in plenty are still yielded by the Workmen's Compensation Act. Fifty appeals under the Act stand for hearing, several of which, notwithstanding their vital importance to the injured workmen concerned, have been allowed to remain unheard three or four months. The judge of the Court of Appeal received, last sittings, a good deal of assistance from some of the King's Bench judges, who, with Lord Sumner, assisted to form a third court. They will want it again. In the Chancery Courts 354 cases are entered, which, notwithstanding Mr. Justice Neville's absence all last term, is only forty-one above the number twelve months ago. Only once, however, in ten years has the number been larger: 1905, 252; 1906, 201; 1907, 273; 1908, 345; 1909, 275; 1910, 355; 1911, 200; 1912, 350; 1913, 313; 1914, 354."

* * *

Railway Accidents in Great Britain in 1913.—A return made recently by the British Board of Trade shows that in 1913, 1,131 persons were killed and 9,054 injured in the course of public traffic on the railways in the United Kingdom. Compared with the previous year, the fatalities increased by twenty, and the cases of injury by 355.

	Killed.	Injured.

INSURANCE NEWS IN THE WEST

Illinois Anti-Trust Suit Developments.—This week the attorneys of the fire insurance companies filed a demurrer in the anti-trust case brought by Superintendent Rufus M. Potts, of Illinois. It was along the general lines that the facts set up did not constitute a cause of action. Hearing was set on the demurrer for some time after October 24. Thus all the litigation between Mr. Potts and the companies has been postponed until about election time, and it probably will not come up till after election. If politics has played any part, as has been suspected, it is difficult to see how these suits can be of any political advantage or disadvantage at the coming election.

The anti-trust suit particularly had a very disagreeable look when it was started, and there was fear that the Superintendent of Insurance would make considerable trouble. As the attorneys have dug into it, however, it has become more evident that it is one thing to make charges and quite another to prove them, and also to prove that they are in violation of law, so the feeling has changed considerably. With the delays that have occurred and the prospect of a considerable time passing before the preliminaries are finished, the feeling has grown in some quarters that there is little cause to worry about the outcome, as it is too far in the future.

Blue Goose Meeting in Chicago.—The grand nest of the Ancient and Honorable Order of the Blue Goose held a very satisfactory annual meeting at Chicago on Tuesday. For the first time in four years the membership has shown an increase. Two new ponds were established during the year, and all but two State ponds were represented at the grand nest meeting. Among the delegates present the feeling existed that the days of high pressure and frothy enthusiasm are past and that henceforth the order is likely to have a normal growth and continue to serve its purpose of creating better feeling among field men and acting as the agency for their social enjoyment as men in one line of work.

* * *

Meeting of the Fire Underwriters' Association of the Northwest.—If a greater co-operation between insurance companies and insurance commissioners is not brought about in the West, it will not be the fault of some of the clear thinkers in the business. In arranging the programme for the meeting of the Fire Underwriters' Association of the Northwest, held in Chicago this week, President D. W. Andrews suggested that "Co-operation" be the keynote. Those who delivered non-technical addresses were W. E. Haines, secretary of the Ohio Farmers; George K. March, special agent of the New Hampshire in Michigan; B. T. Duffy, State agent of the Royal in Ohio, and H. W. Binder, a prominent local agent of Council Bluffs, Iowa. They handled the subject of co-operation independently and from various angles. It was noticeable that Messrs. Haines and March followed the same line of thought to such an extent that parts of the address of either might almost have been a "re-write" of that of the other. This was especially true of their attitude towards State supervising officials and legislators. Both took the position that these representatives of the public are endeavoring to do their best and that they are not unfriendly to the insurance interests, but that the unsatisfactory laws and, in some cases, their unsatisfactory administration are due in a large degree to the aloofness of the insurance men themselves. Those who know the problems and the needs of insurance were urged to get on friendly terms with the public officials and legislators and give them the information in their possession to be used for the benefit of the public. It was noticeable also that these two speakers emphasized the great need of anti-discrimination laws and that both admitted that in the event of the enactment of such laws the public is entitled to State supervision over rate-making as a safeguard to its interests. This is the same position as that taken by the Michigan Association of Insurance Agents at its annual meeting in July, when it committed itself to the plan of securing such a law in Michigan if possible.

Another point on which Messrs. Haines and March agreed is the desirability of co-operation to bring about conditions under which American fire insurance companies can be organized and have a chance to thrive instead of being crowded out of business by the writing of jumbo lines and the reinsurance of large parts of them.

The State insurance federations now being organized in the West are also built on the foundation of greater co-operation between insurance men, the public and State officials and legislators, with a view to securing legislation which shall be in the best interest of the people as well as of the insurance companies and their agents.

* * *

State Federation in Indiana.—Steps were taken in Indiana last week by a number of prominent insurance men to form a State insurance federation and a call went out for a general meeting at Indianapolis on Friday of this week. Some prominent insurance men from adjoining States are expected to be present at the meeting to give such assistance as they can to the movement.

* * *

Life Companies Alter Investment Policy in the West.—Orders received by Western representatives of a number of life companies to discontinue making farm loans has created much interest and some apprehension. The cause assigned for this action is the need of harboring cash to meet the demand for policy loans that may arise. Rates are reported to have risen, so that around Kansas City the real rate that the farmer has to pay, including the brok-

ers' commission for negotiating the loan, amounts to 7 per cent on five-year loans. The tightening up by life insurance companies has naturally created a stronger demand on the banks. They are reported as not desirous of tying up their funds in long term loans, but the trust companies are said to be doing as much of this business as they can consistently with sound business practices.

It has been pointed out that land values may be affected. Comparatively few sales of farms are effected without some borrowing. If it is hard to borrow money and the interest rates are high, sales may be expected to be slower with a tendency to depreciation in farm values.

* * *

Supreme Court Decision Under Workmen's Compensation Act in Michigan.—The Supreme Court of Michigan last week handed down a decision as to the proper method of computing the wages of a workman for purposes of determining compensation. It is said that the court was unable to find precedents and was obliged to depend upon an analysis of the workmen's compensation act itself. The industrial board had awarded compensation to the widow of a miner who was killed, computing his wages by multiplying the daily wage by 300 to get the annual earnings and dividing that sum by 52 to get the weekly wages. The Supreme Court took cognizance of the fact that mining is a seasonable occupation. It was found that the miner had worked but 211 days during the year just previous to his death and that his total wages for the nine years he had been employed by the mining company amounted to $5,175. On this basis the annual wages were $575 and the weekly wage $11.06. The compensation to the widow was ordered paid on the basis of 50 per cent of this amount.

* * *

Influence of New York Compensation Act in the West.—As was to be expected, the high compensation provided by the New York law is having an influence in the West. From Michigan it is reported that the labor organizations are beginning to make a demand that the law of that State be amended to pay higher compensation, and that this demand is being taken up by some who are seeking office. Former Governor Osborne, who called the special session of the Legislature that enacted the present law, is seeking election as Governor again and is making his canvass in part upon the ground that he favors a law much more liberal to the workingmen. There is little question that the labor unions in States where compensation is based on 50 per cent of wages will come forward at the right time with demands for a higher scale. As Michigan employers are expected to oppose the charges proposed, so it is to be expected that employers in other States will raise similar opposition.

Chicago, October 9, 1914. LA SALLE.

ITEMS OF INSURANCE NEWS.

Press notices and dispatches as collated by the Bonding Department of the Fidelity and Casualty Company of New York, indicate, for the month of August, 1914, the following defalcations:

Banks and trust companies	$233,615.64
Beneficial associations	4,200.00
Public service	69,203.16
General business	217,317.40
Insurance companies	775.00
Transportation companies	4,889.00
Miscellaneous	4,319.82
Total	$534,320.02

Life insurance companies in the United States made the lowest record in their history last year in the matter of mortality. The percentage to expected mortality was 66.09 per cent, as compared with an average of 72.38 for the past decade. Last year 11 of the 70 companies scheduled had a mortality below 50 per cent of the expected, while 18 were under 60 per cent. The industrial companies, while naturally having a higher mortality than those writing ordinary business, showed a ratio of actual to expected of 86.09. This is an increase from 85.54 in 1912, but compares with an average of 95.37 for the past decade.

During the year 1913, there were 499 steam boiler explosions in the United States; 180 persons were killed and 369 injured.

There were 21,510 deaths in Alabama during 1913 and 47,926 births, according to the vital statistics report recently made public. Of the deaths, 10,524 were whites, and 10,968 negroes. Of the births, 31,195 were whites and 16,731 colored. Tuberculosis led in the toll of death, claiming 2,026 negroes and 737 whites. Pneumonia followed, with 1,624 black deaths and 836 white. Organic heart trouble came third, with 1,018 black and 478 white deaths. Of the 21,510 deaths, says the report, 7,475, or 34.7 per cent, were preventable.

According to the record of the fire marshal of the State of Virginia as contained in the report of Commissioner Button there were 1,854 fires in that State reported between May 1, 1913, and the same day of the current year. The value of the property is given as $14,792,407; the amount of loss as $2,300,374, and the insurance as $7,651,256. Four hundred and sixteen of the buildings in which the fires occurred were of brick or stone and 1,329 were of frame. Of 630 of the fires the cause is not known, 250 were due to defective flues, 150 to sparks, 136 to stoves and stove pipes, 67 to careless use of matches, 61 to carelessness of adults, 25 to carelessness of children, 61 were of incendiary origin, 43 were caused by lightning, 34 by gasoline, 44 by electricity and 14 by rats and mice.

The total net premiums, including interest on perpetual policies, collected by fire insurance companies in Philadelphia in the six months ended June 30, 1914, were $3,091,584. This compares with $2,670,936 in the six months ended December 31, 1913, and with $3,045,402 in the six months ended June 30, 1913. The increase over a year ago was $46,182. These figures were tabulated from returns made to the Philadelphia Fire Insurance Patrol for the first half of the year.

On the other hand, Charles B. Hill, secretary of the Fire Insurance Patrol, reported that for the first five months of this year there had been an increase of $321,082 loss, resulting from fires over the same period in 1913. The estimated total loss for the first five months of this year had been $1,253,556, as compared with a total loss of $932,474 in 1913.

The number of fires has also greatly increased. During the first six months of this year there have been 218 more than the corresponding period in last year. The total number of fires for the first six months of this year is 2,187. There have been 329 more alarms rung in during the first six months of 1914 than in that period in 1913. The total number of alarms for that time this year is 2,542.

Premiums and losses on tourists' baggage insurance in 1913, as reported to the New York Insurance Department by the respective companies, show total premiums received as $147,973, with total losses of $29,-608, a loss ratio of 20.1 per cent.

Figures on sprinkler leakage insurance in 1913, as reported to the New York Insurance Department by both fire and marine and casualty companies, show total premiums received of $508,936, with total losses of $225,-077, a loss ratio of 44.2 per cent.

The Ohio State Fire Marshal's office reports that in the year 1913 there were 5,340 fires reported to that department. Of this number 2,448, or well along towards half of them, occurred in dwellings. Defective flues caused 443 and sparks from chimneys, 347, while incendiarism was responsible for only 43. Thus, we find that statistics bear out the statement that a very large proportion of all fires are preventable.

Statistics of the results of fire underwriting in Canada by the regularly licensed companies under the supervision of the Dominion Government of Canada from 1869 to the close of 1913, a period of forty-five years show that while here and there individual companies may have earned good profits as a result of their fire underwriting in Canada, as a whole the business yields exceedingly modest returns. Attention has been given to this matter by the "Chronicle" of Montreal, which states that the amount which has been received by the fire companies during the forty-five years is almost $370,000,000. Classified according to nationality the amounts received by the respective companies are as follows:

Canadian companies	$81,706,778
British companies	225,693,037
American and French companies	61,620,365

Only eleven years ago the aggregate premiums received by the fire companies from 1869 onwards totalled $177,000,000, the average rate of growth during the last eleven years having been nearly $17,500,000. During the forty-five years the losses paid by the whole of the companies amounted to $227,602,002, divided as follows:

Canadian companies	$51,590,419
British companies	140,758,700
American and French companies	35,257,883

The proportion of losses paid away by each class of company was, Canadian, 63.1; British, 64.6, and American and French, 57.2 per cent, the general average being 61.7 per cent.

Insurance Commissioner Taylor, of North Dakota, admits that after four years' trial the State hail insurance scheme has proved to be a failure. In the first year loss claimants received 70 per cent; in the second year, 55 per cent, and last year 88 per cent. This year the losses have greatly exceeded the premiums, and it is now probable that not more than 70 per cent can be paid. Up to August 10, with all the premiums in, the

losses incurred exceeded the total premiums by $1,000, and a number of serious storms occurred after that date.

Following the resignation of Hon. Fred E. Richards as president of the Union Mutual Life, of Portland, Me., after twenty-one years of service in that capacity, comes the announcement of the election of Arthur L. Bates, former vice-president, to fill the vacancy. President Bates has been in the service of the company during his entire business life, a period of nearly forty-five years, starting as a young man with the company in the position of a junior clerk, and advancing through the several departments of the offices. He has been vice-president and a member of the board of directors for upwards of twenty years.

J. Frank Lang, former secretary of the company, was elected vice-president and Sylvan B. Phillips second vice-president, was elected secretary.

Captain John H. Mitchell, eighty-six, vice-president of the Phoenix Insurance Company from 1888 until his retirement in January, 1908, died at his home on October 6. He was made captain for gallantry in the battle of Gettysburg, having enlisted in a Pennsylvania regiment. The burial will be in his native town, Warren, Pa.

The United States Office of Zurich General Accident and Liability Company has announced that $250,000 of additional funds has been received from the home office, which, with the present showing of assets, reserves and surplus, make those figures stand out prominently, the assets now totaling $2,008,997.51. After special reserves of $100,000 are set aside for contingencies, in addition to legal reserves, the surplus now amounts to the handsome sum of $1,006,930.20.

It is stated that the 4,000 shares of the capital stock of the New Amsterdam Casualty Company underwritten by the syndicate of Baltimore bankers, have been marketed at $50 per share, the par value being $25 per share. The excess of each share will go to the surplus fund of the New Amsterdam Casualty. This company will have on January 1, 1915, a surplus of $317,221 and a cash capital of $500,000.

The Alabama Insurance Company, which was recently restrained from doing further business in Alabama by an order issued by Judge Miller, of the City Court of Birmingham, will be operated as a going concern during a temporary receivership. The company was organized in 1911 and does an industrial life insurance business. Dr. F. B. Sutton, of Birmingham, is president of the company.

The new manual for workmen's compensation, public liability, teams, elevator and automobile liability, for all States, has just been issued by the Workmen's Compensation Service Bureau. It has been compiled by Actuary Stanley L. Otis and is on an entirely new basis from anything heretofore attempted. All the classifications are expressed in symbols which, when read in connection with the differential sheets provided, give the rate on the class in any State according to the differential used.

The following resolution was unanimously adopted at the recent convention of Insurance Commissioners. It was offered by the Executive Committee, to whom were referred telegrams from President Edwin Warfield, of the Fidelity and Deposit, and Editor James R. Gray, of the "Atlantic Journal," asking that the commissioners approve insurance companies investing in cotton and to carrying the investments as assets:

"Resolved, That while the individuals of this convention are in full sympathy with the spirit of the buy-a-bale of cotton movement and with the spirit of any similar movement which has been or may be hereafter started, it is not within the power of this convention or of its individual commissioners to approve of any specific act or of any investment by our insurance companies, unless such act or investment be authorized by law."

There is much speculation among Virginia insurance men regarding the probable recommendations of the State Tax Commission as applied to their business. Some of the commissioners are said to be urging a proposition to increase the amount each company is now paying in taxes and to fix the insurance tax at a lump sum which shall be paid in lieu of all State and municipal taxes on the insurance business. Though the matter is still in the hands of a sub-committee, it is generally understood that a rate of between 2 and 3 cents on the gross receipts of all companies will be recommended, the life companies to be placed on the same basis as the fire companies.

Under the permanent warehouse and marketing bill passed by the Texas Legislature the contents of such warehouses must be insured in regularly licensed companies. It is also stipulated that no stock company shall have at risk on any such warehouse and contents over 10 per cent of its combined capital and surplus, except on cotton and grain. More than 10 per cent may be written, under the provision, but it must be reinsured down to 10 per cent.

National legislation, requiring boiler and steam engine specifications and boiler inspections in every State, was favored by the members of the National Association of Stationary Engineers at the annual convention held in Milwaukee. The organization will send representatives to the annual convention of the American Society of Mechanical Engineers for the purpose of co-operating with that association in demanding uniform national steam boiler inspection laws.

The meeting of the American Institute of Actuaries will be held at Madison, Wis., on Monday and Tuesday, October 19 and 20. The meeting of the institute will be held in one of the assembly rooms in the University of Wisconsin. An interesting programme has been arranged as follows:

1. Interim premiums; 2, War and insurance, special reference to the present European War; 3, Methods for conserving business; 4, The fraternal situation; 5, Methods of conversion as of age and entry, charging difference in reserves or difference in premiums; 6, What constitutes discrimination? 7, Group insurance; 8, The lapse factor; (a) In computing premiums; (b) Reserves; (c) Its mortal aspects; 9, Methods for restricting the volume of policy loans; 10, When does a policy take effect? 11, Waiver of premiums and other disability benefits for female risks; 12, Acceptance of premiums after due date; (a) On application for reinstatement; (b) medical re-examination.

The following officers were elected at the recent meeting of the International Claim Association to serve for the coming year:

President, M. Barrett Walker, attorney, United States Fidelity and Guaranty.

Vice-President, P. N. Trone, secretary, Indiana Travelers' Association.

Secretary, Harry J. Nesbitt, attorney, United States Casualty at Pittsburgh.

Treasurer, F. L. Templeman, Maryland Casualty.

Executive Committee, Dr. W. L. Gahagan, chairman, superintendent accident and health department, Globe Indemnity; D. N. Case, chief adjuster, Travelers Insurance; W. A. Budlong, Commercial Travelers Mutual Accident, and W. R. Freethy, superintendent claim department, Employers' Liability.

The Insurance Federation of Minnesota has been organized at Minneapolis by nearly a hundred leading agents representing various parts of the State and all branches of the insurance profession. The officers and executive committee chosen are as follows:

President—Theodore Williams, Mankato.

First Vice-President—Alexander Campbell, Minneapolis.

Second Vice-President—R. M. Neely, St. Paul.

Third Vice-President—A. A. Wright, St. Cloud.

Secretary—F. C. Wynne, Minneapolis.

Treasurer—W. T. Lemon, St. Paul.

Executive Committee—Casualty, Fred L. Gray, Minneapolis, chairman (elected for three years); Lane MacGregor, Duluth (one year). Fire, Frank A. Mannen, Minneapolis (one year); A. P. Pierce, Red Wing (three years); P. W. Parker, St. Paul (two years). Surety, Wirt Williams, Minneapolis (one year); W. S. McCurdy, St. Paul (three years). Life, Byron Timberlake, Minneapolis (two years); C. E. Learned, St. Paul (one year).

The Illinois Farmers' Institute has made arrangements with State Fire Marshall Walter H. Bennett to be present at twenty-five County Farmers' Institute meetings during the year 1914, and to address the meetings on the subject of Fire Prevention and the Conservation of the State's Resources from the Red Plague of Fire.

An excellent plan for handling injured or sick under compensation or employers' liability policies has been adopted at New Orleans. The idea emanated from Edwin Shelby, manager of the New Orleans Casualty. Whenever possible, patients are sent immediately after an accident to Dr. Brosnan's Hospital, at New Orleans, at the expense of the company, and treated there at a pre-arranged scale of charges, under contract. Cases are often brought a distance of two hundred miles. The results have been eminently satisfactory to employer, employe and the company.

The National Fire Protection Association advocates the following measures in its warfare against the needless sacrifice of human lives and property by fire:

(1) The encouragement of fire-resistive building construction through the adoption of improved building codes by all States, cities and towns. The inclusion in such codes of adequate rules for exit facilities based on the occupancy for all buildings.

(2) The adoption of laws or ordinances requiring the installation of automatic sprinkler systems as fire extinguishing agents in all factories, commercial establishments, and city blocks. The adoption of ordinances requiring the construction of fire division walls not only as a property protecting device, but as providing the best life-saving exit facility.

(3) The establishment by law of a fire marshal in every State, who shall be a trained man, with statistician, educator, and prosecutor.

(4) The investigation of the cause of all fires by public officials.

(5) The consolidation of all legal forces so as to provide for the systematic inspection of all buildings by local firemen and technically trained building and factory inspectors so as to insure the vigorous enforcement of rules for cleanliness, good housekeeping and the maintenance of safe and unobstructed exits, fire-fighting apparatus, and other protective devices.

(6) The especial safeguarding of schools, theatres, factories and all other places in which numbers of people congregate or are employed.

(7) The vigorous State and municipal regulation of the transportation, storage and use of all inflammable liquids and explosives.

(8) The careful study of municipal water supplies, their adequacy and reliability, with special reference to their adequacy in case of conflagrations.

(9) The universal adoption and use of the safety match.

(10) The education of children and the public generally in careful habits regarding the use of fire.

FINANCIAL AND COMMERCIAL REVIEW

REGRETS for the prosperity that might have been are of course vain in the presence of the terrible catastrophe which the European War means. How much of an economic disaster the war is going to prove for the world in general is a question which must be left for time to answer, although it is doubtful whether Americans in their own favored country have begun yet to realize that the war is going to hurt their business and values severely. Faced with the actualities of the prospect it seems to be the most idle of all futilities to indulge in reckoning the difference to us had there been no such mad collapse of civilization in Europe, but the October crop report can hardly fail to prompt some reference to the situation which we might have had to deal with.

Although the South is distressed to-day on account of the loss of an immediate market for at least a third of its cotton crop this year, and although business and financial interests generally are troubled over the position in which the South has been placed, it is quite probable that the South would have been groaning anyway under the weight of the huge yield of its chief staple in 1914. We may not accept the 17,000,000 bale estimate as an accurate measure of the size of the crop, but apparently there is going to be as much cotton as was picked only a few years ago when the price went below 8½ cents a pound. The chances are that the South would have been filled with vast discontent this Autumn even had there been no European war and would have been clamoring at Washington almost as frantic as now for governmental action designed to keep cotton at or above 10 cents a pound.

There is a good deal of reason for believing that the South is not going to be really ruined by the present misfortunes of the cotton market, and we are sure that after the initial loss on the crop has been pocketed the country as a whole, which includes the South, will gain by having such an abundance of the staple, and there will be trade and industrial compensation for the agricultural damage if the 1914 cotton crop is moved into consumption at a low price. The South itself will among other things have learned the lesson that cotton is a commodity and not cash like so much gold turned out of a mine, and will be led to its great advantage to perceive other agricultural possibilities in its resources of soil and climate.

It is not only the cotton crop which is of bumper size. The total wheat yield is put at 892,000,000 bushels, which is 128,000,000 bushels larger than any previous outturn. The exportable surplus of wheat will go far to repair the difficiencies of the export trade in cotton as a creator of foreign exchange, and it must be remembered in the case of wheat at a high price as in the case of cotton at a low price, that it is not dollar values which determine the amount of a country's wealth, but the abundance of its commodities and products and the facilities which it has for production and distribution. The wheat crop of the year is colossal and there is no other result of farm effort to be placed beside it, but the agricultural season as a whole has made a gratifying record. There have been larger crops of corn, but final figures are likely to show that the harvest was about 2,800,000,000 bushels, which would be up to the average called for by the statistics of recent years.

On agricultural conditions we would, if there had been no war in Europe, be looking forward to a Winter and Spring of active and profitable trade. All the more reason for this anticipation would have been vouchsafed by the liquidated basis on which trade, industry and finance had been placed before the war. Accordingly may not the retrospection in which we have been indulging be regarded as warranted by its encouraging intimations for the actual posture of affairs to-day? Had the war struck us in the midst of an inflated boom with trade volumes expanding and prices soaring in all directions and had the agricultural year been more or less a disappointment, our outlook would have been decidedly dark under the circumstances which the war is creating. It is undoubtedly cloudy and in some quarters gloomy, but the basic economic factors in this country are all such as to give us hope that with a wise and prudent use of our resources and an intelligent management of affairs the people of the United States will be able to prevent the destructions of war from impairing too much the general welfare.

Trade and industrial gains in some directions are already beginning to offset losses in more directions and unless the fortunes of war takea pronounced turn unfavorable to prevailing views, as to where American interests lie in the outcome of the war, our prospect is one that holds out hope of some improvement to counterbalance deterioration. We have not begun to take all the losses which the war will inflict upon us, but there has been a good deal of reckoning of probable losses, so much so that in many respects the worst seems to be known for the immediate present. In dealing with so tremendous a cataclysm as a general war in Europe, which mankind had come to talk of as something calling for only academic apprehension, we have to admit that its long range effects are incalculable, but there is no advantage now in looking too far ahead.

According to the nearer view matters in the United States are far from being as bad as they might. Among intelligent persons this view takes account of the inevitable certainty of much hardship this Winter because of reduced employment, shrunken profits and bankruptcies in numerous important lines of industrial and financial enterprise. At the same time there seems some reason to believe that as long as the United States can, as it assuredly can, keep from becoming politically involved in the conflict abroad, its economic consequences to ourselves are not going to be of such protracted severity as to prevent a large variety of profitable mercantile and manufacturing, as well as banking readjustments, which will tend to overcome the difficulties of the war.

Some foreign trade which we would not otherwise have had must come here from absolute necessity. Consumers are going to have economy, assisted by ability to buy goods at liquidating prices. Many branches of trade and industry will be freed in the home and foreign markets from the customary competition of Europe. Others will find opportunity to manufacture or sell commodities and merchandise which we have been wont to regard as obtainable only from Europe. Once we get over the hurdle denoted by the obstacle of the closed cotton and stock exchanges we will be in a fair way to recover prosperity. Mention might also be made right here of the vision which the financial community is beginning to get of the possibility that the war will compel us to institute measures for the early establishment of the United States as banker for the world. If that happens the economic future will unfold a profitable vista such as hitherto has been only imagined, but never described.

At the moment the larger lines of trade and industry are suf-

fering from a good deal of paralysis. Copper has sold at the lowest level in a dozen years. Steel is languishing for a continuing and increasing lack of orders. The list of securities on which dividends are being reduced, or interest in threatened with default is steadily lengthening, and despite some small growth of dealings under restrictions no real progress seems to have been made in the task of contriving a way to resume regular business in the securities market. Apparently, the cotton exchanges are likely to open before long and a helpful contribution will be made to the whole financial and business situation if this is the case. Once a chance was afforded to trade in a future market for cotton with all the protection which it gives, consumers could begin to accumulate supplies out of the present large admitted surplus against the hazards of a more than probable shortage in the next year or so.

Some hopeful symptoms were manifested by the money market in the last few days. There has been a noticeably freer absorption of commercial paper with the rates tending to fall below 7 per cent instead of rising above it, as has been the case lately. Bankers in general are becoming more used to war conditions and credit is loosening up a little. The currents of cash suggest that the emergency issues of bank notes have caused a redundancy which is beginning to make itself apparent, and it would not be surprising to hear soon that banks were beginning to retire extra circulation. This would be an omen of eventually easier interest and discounts for as long as the banks have borrowed money outstanding in emergency circulation and clearing house certificates they are not going to be very liberal in the terms on which they grant loans.

The foreign exchange market is the principal impediment in the way of domestic monetary improvement. The monetary situation at London is such that the foreign exchanges should be relaxing. Our bankers are puzzled and not a little annoyed by the disposition of the London money market, denoted in the utter failure of American banking effort to evoke any co-operative response from British finance, which has it in its power to bring about workable international monetary conditions. The provision for $80,000,000 of gold exports in the New York City loan operation and the creation of a $100,000,000 gold fund have been followed by displays of strength in sterling remittance and it is not too much to say that British finance is making it hard for our finance to discharge American obligations.

London	23¾	24⅛	24	24	23 13-16	23⅞

COTTON

October 10, 1914.

IT is now the almost universal belief of the cotton trade that the cotton actually produced in this year's crop will exceed in quantity 16,000,000 bales, unless a killing frost occurs over the entire Cotton Belt within the next ten days or two weeks. With regard to the amount of cotton that will be gathered and ginned opinion is by no means so unanimous. On the contrary there are many,—and these among the more far-sighted,—who estimate that perhaps as much as 2,000,000 to 3,000,000 bales (being the last bolls to open) may not be picked at all, because of cotton at the present level would not warrant the payment of wages to pickers of this scattered cotton, and the charges for ginning. It is reasonable to assume that there is much truth in this contention; and, if it be accepted, the prospective burden is seen to be greatly lightened, though the crop would still, according to the estimates most widely accepted, very considerably exceed the consumption possible before the end of August next. We are dealing here, however, with purely theoretic figures on both sides of the balance sheet, and, moreover, with figures that are probably for the time being having next to nothing to do with the price of cotton. It has been an obsession of members of Congress through all the long debates upon the marketing of the American cotton crop that at the beginning of each marketing season the cotton trade estimates the amount of cotton produced(the supply) and the amount required for consumption (the demand) and with these figures before it "fixes" the price of cotton. In this hazy notion there is, when things are normal, this modicum of truth, that the multitude of persons dealing in cotton, whether as producers, merchants or manufacturers, do arrive, each on his own account, at a rough consensus of opinion as to the probable balance of supply and demand, and base their dealings upon this. A price roughly correspondent to the general expectation of the demand and supply value of cotton is arrived at, and is maintained so long as nothing happens to prove the whole calculation wrong. But at the present time no calculation is possible; the only guides to the market value of cotton are the economic cost of production, on the one hand, and the pecuniary necessities of the cotton producers, on the other. The only cotton manufacturers in the world who are in a position to buy cotton at all freely, those of the United States, have, to be sure, in the prices they can obtain for their goods a criterion of the worth of cotton. According to this criterion cotton is now very cheap indeed, and these spinners are disposed to buy with moderate freedom. But they are also very well aware that their own total buying power is sufficient for only forty or fifty per cent of the crop, and that the season's price for cotton will be determined not by their buying, but by the buying that may be developed in foreign markets. Of this, unhappily, there is very little thus far, despite of any deductions that may be drawn from the gradually increasing export figures. As things now stand, therefore, the ultimate balance of supply and demand count for virtually nothing in fixing the price of cotton; and the question of prime importance to the cotton trade and above all to the cotton producers is whether this situation must last for months to come. The rather steadily declining price of cotton in the South would seem to indicate some degree of hopelessness there upon this point. The cotton farmers have, as a class, been exceedingly determined in resisting prices so far below the cost of production as are present prices. But enough cotton is coming out, whether of necessity or through discouragement of the holders, to make the markets still decline. Perhaps some of the panaceas proposed have not appeared substantial enough to the farmers to make it worth while for them to await their effects. The "buy-a-bale" movement is obviously being used for the most part for advertising purposes, and there is only too much reason to fear that it is being made use of for illegitimate gain. In any case, its effects cannot be great. The extravagant proposition advanced from day to day in Congress and by Governors of States are lacking in the ring of sincerity; and the average cotton farmer is no fool. He knows the sounding brass and the tinkling cymbal when he hears them, and he expects nothing of them but idle sound upon the unsubstantial air. Is he, then, right in heing skeptical of genuine assistance in his hard plight? It appears to us that he is not right; that, on the contrary, events are perhaps all too slowly shaping themselves for his relief. The cotton exchanges are nearing the end of the work of repair and self-protection which the sudden outbreak of the European War forced upon them. They will surely be able to re-open in the near future, at least in so far as their internal affairs are concerned. And there are cumulative evidences that external conditions are in no long time to be made right for them. Large plans are shaping in that direction and it is impossible to say whether one or all of them will prove to be adequate. But something concrete is coming out of them before long. It may be that Mr. Festus J. Wade, of St. Louis, will be able to whip into shape his scheme for having American banks provide credit to the extent of $150,000,000 for the financing of temporarily unneeded cotton. More probable still, in our opinion, is that something important wll come of the plan of Sir Charles Macara to have the British Government, in co-operation with the American Government, devise a way for setting up a great reserve of cotton. Of course, danger lies in this direction; but it is in times of war that the nettle danger is, not avoided, but grasped.

THE CONTRACT MARKETS

THE NEW YORK COTTON EXCHANGE.

The following were the high, low and closing bid prices for each delivery, on Friday, July 31, in cents and hundredths of a cent per pound, gross weight:

The MOVEMENT OF THE AMERICAN CROP.

The American crop year has been changed to run from August 1 to July 31, and all comparisons are made up accordingly.

The following tables, derived from the New York Cotton Exchange, show the movement of the American cotton crop for the past week and since August 1, 1914, with comparisons for previous years:

CROP MOVEMENT INTO SIGHT.

Weekly Movement.	1911-12.	1912-13.	1913-14.	1914-15.
Port receipts	435,150	413,332	411,256	164,816
Overland to mills and Canada	15,007	16,188	24,576	9,565
So. mill takings, est., exclusive of takings from Southern ports.	80,000	80,000	80,000	50,000
Gain of stocks at interior towns	65,213	70,130	56,326	93,493
Brought into sight for week	595,370	573,640	571,958	317,874
Total Movement—				
Port receipts	2,354,908	2,064,373	2,163,769	615,383
Overland to mills and Canada	41,355	32,444	63,340	21,265
Southern mill takings..	397,032	370,873	409,796	173,000
Stocks at interior towns in excess of Sept. 1..	282,251	213,652	179,837	286,521
Brought into sight thus far this season	3,075,546	2,681,342	2,816,744	1,096,169

The total crop movement is respectively for 74 days, 72 days, 71 days and 70 days.

The Cotton Situation in Egypt.—Vice-Consul General Paul Knabenshue, of Cairo, writes as follows, under date of August 25, concerning the cotton situation in Egypt:

The movement and shipment of this year's cotton crop is un-

Cotton for Spinners' Use.

doubtedly the most vital problem now confronting Egypt as a result of the European crisis.

The Egyptian cotton crop for this year is estimated at nearly 800,000,000 pounds, or more than an average yield. There are still nearly 100,000,000 pounds of last year's crop on hand and practically nothing has been exported since the beginning of hostilities. The usual channels of distribution are momentarily blocked owing to the collapse of the international exchange system and the paralyzed state of the cotton spinning industry. The problem is specially serious for Egypt, for the reason that its one and practically only source of wealth—cotton—is facing a most serious crisis.

In normal times Egyptian banks are accustomed to import large quantities of gold—$50,000,000 to $75,000,000—in order to finance the movement of the crop. Since the beginning of the war almost no gold has been imported. To overcome this difficulty the Egyptian Government first promulgated a decree on August 3 making National Bank of Egypt notes legal tender with the same value as gold.

On August 19 the Prime Minister presided at a meeting attended by the members of the Superior Board of Agriculture and representatives of the leading cotton companies and financial institutions of the country. The meeting appointed a committee of local experts to make a report upon the subject of financing and handling the Egyptian cotton crop. It was further decided that although the local resources were probably sufficient to deal with the financing of the crop, it was desirable to obtain the concurrence of Great Britain also, and it was decided to nominate special delegates who were then in London to discuss the matter there with the proper authorities. While no further definite action was taken it was decided in principle that the National Bank of Egypt should advance money to the cotton growers for all cotton offered to it, storing the lint as security in its warehouses. To enable the bank to accomplish this the Government will authorize it to make a further issue of bank notes against the cotton thus held.

As a result of this measure the small cultivators will not be asked or forced to sell their crop at sacrifice prices. They will have the opportunity of pledging it for a portion of its market value—an amount sufficient to tide them over current financial difficulties—and will receive in return notes of a legalized tender. When the international situation resumes a more settled aspect and the foreign demand for cotton for manufacturing purposes again becomes normal, the stocks held by the bank will be disposed of at market value and the producers will receive full prices for their commodity.

It is expected that the larger and wealthier cultivators will hold their cotton for some considerable time until they can demand

higher prices than can be obtained at present. Many of the smaller cultivators will undoubtedly take advantage of the advances proposed to be made by the banks, but their stocks of cotton will probably not be held for any great length of time, and the ultimate price obtained will in all probability be much lower than usual.

While it is expected that the measures adopted by the Government will largely facilitate the financing and movement of the cotton in Egypt, the questions of finding foreign markets for the crop and means of shipping it from Egypt also present difficulties to be overcome. The Continent of Europe will undoubtedly not take its usual supply of Egyptian cotton this year, and English spinners will also take less Egyptian cotton, owing to the fact that their exports to the Continent of products manufactured from such cotton will be materially less than usual. Egyptian cotton is looked upon as a luxury and it will undoubtedly be affected, as well as all other such commodities, by the present Egyptian crisis. Consequently the greater part of this year's crop will undoubtedly be held until the war is over and trade revived again. In order to prevent a surplus supply of Egyptian cotton next year, with resulting low prices, the Ministry of Agriculture has already formulated plans for reducing the area to be planted under cotton next year by about 60 per cent. The cultivators will be instructed to grow in its stead corn, rice, beans, and other grain and food products.

The Commission de la Bourse des Marchandises, at its meeting on August 6, decided that all contracts then open must be closed forthwith at the prices of $15⅝ per cantar (100 pounds) for November contracts, $15 9-16 for January, and $15 13-16 for March. That is to say, if a buyer has bought cotton at a certain price for delivery in November, he would be obliged to sell it out now at $15⅝; or, if a seller had sold at a certain price for the same delivery he would be obliged to buy it in then at the above rate. In ordinary circumstances he would complete his operation in November, or sooner if he chose, but now he is compelled to close it at once and at the price fixed. There was considerable opposition to this measure, which was not carried unanimously, but by five votes to three.

The Liverpool Cotton Association, it is understood, sent a formal telegram of protest against this arbitrary method of dissolving the contracts of its members and a protest was also lodged with the Egyptian Government.

The Egyptian Government has since vetoed the decision of the Commisison de la Bourse des Marchandise, and has allowed the commission a few days in which to bring forward some proposal acceptable to all sides or to rescind its decision.

THE WORLD'S DEMAND FOR COTTON, AND INDIA'S SHARE IN MEETING IT

By Arno Schmidt*

Secretary of the International Federation of Master Cotton Spinners' and Manufacturers' Association, Manchester, Eng.

THE cotton industry of the world has, during the last ten years, been suffering from a scarcity of raw material. This scarcity has frequently been so pronounced that mills in all parts of the world have been obliged to curtail production at one time or other. At a meeting of the International Committee held two weeks ago in Paris, it was generally admitted by the representatives of fifteen countries that the cotton spinning industry all the world over had never been in such a depressed condition as at present, and it was stated by the members of the committee that many English and Continental spinning mills are curtailing their working hours. This slackening of trade is partly due to the Balkan War and the Chinese Revolution, but very largely also to the high price of American cotton, which rules the prices of all other cottons.

The primary cause of short-time working undoubtedly arises from the fear that the world's yearly supply of cotton will not be sufficient to meet the yearly demand. During last season, we were told that the American cotton crop would be about 13,500,000 bales, whilst it is recognized that 14,500,000 bales of American cotton are required annually. This probable scarcity caused an increase in the price of the raw material and of the finished article, and a falling off in the demand for manufactured goods. It must be remembered that by far the vast majority of the people in the world, the poorest, who have no choice but to use cotton clothing, have only a very small fixed amount per annum to expend on clothing, and it makes a great difference to them, in the quantity of clothing they can afford to buy, whether cotton is 6d. or 8d. per pound.

What Are the Possibilities of Extending Cotton Cultivation in the World?

Africa.

At one time the hope was entertained that Africa would solve the problem of supplying the cotton spinning industry with its ever-increasing requirements, but after ten years' work in that continent it has been proved that, in consequence of the absence of the requisite training of the people, the comparative scarcity of labor, the absence of transport facilities, the necessarily slow development of research work, and of the unwillingness of the people to work longer than is absolutely necessary to keep their few wants supplied, developments in these parts must be slow. Perhaps the next generation will reap the benefit of the present pioneer work. Most valuable work is being carried on, not only by the British Cotton Growing Association, but also by the German, French, Italian and Portuguese colonial cotton growing associations. The very existence of these associations is a proof of the earnestness with which this question of increasing the supply of cotton is being handled.

Egypt.

Egypt is limited in its cotton crop by the comparatively small area that can be irrigated; Lord Kitchener is doing his utmost to reclaim some considerable stretches of waste land, and bring it under irrigation. Egypt now produces about 1,000,000 bales, of 700 pounds, per year, but there has been during the past ten years a falling off in the yield per acre.

Anglo-Egyptian Sudan.

The possibilities in the Anglo-Egyptian Sudan are certainly very great, but it will probably take fifteen years for that country to produce half a million bales. In view of the threatened shortage of long-staple cotton from America, owing to the advance of the boll weevil into the Sea Island tract, the irrigation scheme in hand in the Sudan should be accelerated, and money should be liberally supplied for the work.

United States.

Cotton planters of the United States of America, and others interested in land, often assure us there is no need to look elsewhere for the supplies to meet the increasing wants of the cotton industry. I would say, in reply to this contention, that it would be unwise for the world's spinners to depend upon one source of supply only, especially when, as in the case of the United States, there is a climate which, judging from the alarmist reports issued every year, seems to be the most uncertain in the world. Further, the cotton districts in the United States are suffering severely from lack of labor. Several experts who have recently visited the country state, that in 1911, when the cotton crop of the United State

*An address before the semi-annual meeting of the National Association of Cotton Manufacturers, Lenox, Mass., September 30, 1914.

reached 16,000,000 bales, much more was grown, but that it had to be left to rot in the fields, as there were no people to pick it. Some authorities maintain that wages have increased of late to such an extent that the growing of cotton is becoming unremunerative, and that unless cotton can be sold by the planter at 6d. per pound, which means that the spinners will have to pay considerably more, cotton cultivation in the United States of America will decline. As an example of the recent wages paid in the United States I am able to state that, whilst the "piece rate" for picking in Texas usually began at 50 or 60 cents per 100 pounds of seed cotton, rising later, as the crop became thinner and more difficult to gather, to over 100 cents, during the early part of last season pickers could not be got in Texas below 70 cents, and the 100 cents rate was reached very quickly. If we remember that it takes about 300 pounds of seed cotton to make 100 pounds of lint cotton, the cost of picking works out to 1½d. per pound. Under these conditions, countries outside the sphere of such high wages seem to have an excellent opportunity of competing with the United States of America, even if the climatic conditions are not as favorable. Experts seem more and more of the opinion that cotton growing in the United States will only be remunerative in the case of long-stapled cottons, such as are produced in the Mississippi Delta, whose value is much above the ordinary type.

These considerations seem to justify the prevalent assumption that the limit of the cotton crop of the United States has been reached. It is true that owing to the excellent organization of the United States Department of Agriculture the yield per acre is gradually increasing; but if labor cannot be found to harvest the cotton, the full advantage of its capacity cannot be realized. So long as no efficient mechanical cotton picker is invented (and so far the results obtained have not been satisfactory), the cotton crop of the United States will probably not far exceed 16,000,000 bales. In the event of an efficient mechanical cotton picker being put on the market, it is doubtful if many planters would be able to afford to purchase it. The tendency in the States is to split up the large plantations into small holdings, and the small farmer has not the capital with which to buy such a machine. We must not leave out of consideration the boll-weevil scourge which is devastating vast stretches of territory. It is stated that in five years time the Sea Island cotton districts will be attacked, and that the farmers there will be forced to grow early-maturing varieties of cotton, which are largely of short staple. It is for this reason that every effort should be made to complete the irrigation works in the Anglo Egyptian Sudan. Egypt and the Sudan will be called upon to make up for the shortage that will result in the supply of long-staple cotton, when the Sea Island districts have become a prey to the ravages of the boll weevil.

South America.

The republics of South America are already suppliers of cotton to a small extent (500,000 bales), and when better means of transportation are established, and the population increases, it is probable that Brazil and Peru will furnish large quantities of cotton. But for a generation or two, this cannot happen. At present the unsettled financial condition of these republics prevents development.

Asiatic Russia.

Asiatic Russia supplies the Russian cotton industry with 1,000,000 bales of cotton of 500 pounds, quite equal in quality to Middling American. The principal cotton growing districts are Ferghana, Syr Darja, Semiretschensk, Samarkand, and the Transcaspian territory. The danger of the increasing evaporation of moisture from the soil in Turkestan, the lack of transport communications for the importation of fodder and food crops, as well as for the exportation of the cotton crop, and the lack of labor, are the principal reasons why the extension of cotton cultivation in Asiatic Russia is bound to be slow. The average wage of a laborer is 4 shillings per day; this alone is enough to prevent any large extension.

China and Korea.

It is estimated that China and the Korea produce about 1,500,000 bales of cotton of 500 pounds, but very little is known as to the possibilities of extension. The quality produced is very low, and the cotton is adulterated with over 15 per cent of water and sand. The unsettled political state of China is bound to impede developments there.

Turkey.

Turkey produces about 100,000 bales of cotton per annum. Owing to the massacres which have recently taken place in Asia Minor, the country suffers severely from lack of labor, and even if the projected works of irrigation are successfully carried out, it will be a long time before appreciable quantities of cotton can be exported.

India.

After considering the possibilities of the extension of cotton cultivation in all these countries, we come to India, which possesses an excellent network of railways, has a hard-working population, 90 per cent of the 315,000,000 being born agriculturists, and in which cotton has been an important crop from time immemorial. It is true that crops in India are largely dependent on the monsoons, but it is equally true that the climate of India is no less favorable to cotton growing than that of the United States. Besides, the Government has developed a wonderful system of irrigation, especially in the North; and the Indian ryot, taking him as a whole, is a steady, plodding worker, who has begun to appreciate the advantages resulting from an increased income. This is a very important factor. The Indian ryot has discovered that well-irrigation makes cotton growing profitable; indeed, in Madras and the United Provinces, the number of wells constructed by the cultivators in recent years may be said to represent the savings that have resulted from the increased profits on cotton cultivation. These wells are the best insurance against famine.

I now turn to the question of the demand for raw cotton. It has been said that a demand for cotton goods is one of the first signs of civilization.

Mr. Alexander J. Kusnetzoff, one of Russia's leaders of the cotton industry, stated at the Seventh International Cotton Congress at Brussels (1910) that of the 1,500,000,000 inhabitants of the earth, there are only 500,000,000 completely clothed, whilst 750,000,000 are partly clothed, and 250,000,000 do not possess any clothing whatever, and that in order to provide clothing for the whole of humanity, at least 42,000,000 bales of cotton, or 15½ pounds for every human being, were annually required.

The world's consumption of cotton has increased from 1909 to 1913 at the rate of almost one million bales per annum! These figures are based upon the statistics issued by the International Cotton Federation, compiled from the individual returns of the spinners.

Russia has increased its consumption of cotton as follows:

	Consumption, Pounds (Eng.)		Consumption, Pounds (Eng.)
1855	54,195,000	1901	603,371,000
1860	90,325,000	1902	541,950,000
1870	144,520,000	1903	794,860,000
1875	162,585,000	1904	726,213,000
1880	307,105,000	1905	614,210,000
1886	361,300,000	1906	755,117,000
1890	252,910,000	1907	751,504,000
1894	444,399,000	1908	794,860,000

The weight of cotton cloths produced on power looms and consumed in India has increased from 536,960,200 pounds in 1896-97

to 988,027,318 pounds in 1912-13. The consumption per head of the population in India is equal to 3.63 pounds, or roughly 14 yards. The clothing of the people of India requires at present 3,250,000 bales of cotton (including wastes), but every additional yard used per head of the population represents an increase of about 232,000 bales of 500 pounds each. The increased prices which the cultivators of India are receiving, not only for their cotton, but also for other produce, are bound to place them in an improved financial position, which will undoubtedly lead to an increased expenditure on clothing.

But besides Russia and India there are other vast countries, such as China, Africa, Central Asia, etc., all of which will demand increasing supplies of cotton clothing.

Consideration must also be given to the fact that cotton has entered into many new uses in Europe. It is in great demand for the making of motor car tire covers, bagging, ropes, aeroplane cloth, etc.; and, as a result of the discovery of the mercerizing process in the manufacture of certain classes of goods, cotton has replaced silk to a considerable extent. As soon as the fashionable ladies of Europe revert from the "hobble" skirt to the fuller skirt —and fashion seems to be developing in this direction—large additional supplies of cotton will be wanted. Spinning and weaving machinery has extended to meet the increased demand, and this extension will continue; but the cotton industry must obtain an annual increase of about 1,000,000 bales of raw material.

As a further example of the growing consumption of cotton by the European countries, I may state that, according to Government figures, the consumption per head of population in Germany has increased from not quite three-quarters of a pound in 1840 to 16 pounds in 1912. Whilst the figures for the consumption of wool show a decline, the cotton consumption is more than twenty-five times bigger than seventy years ago.

This enormous and ever-increasing demand for raw cotton secures the cultivator for many years to come a remunerative price for his cotton crop, and not only the Government of India, but every other Government is fully justified in encouraging the cultivation of cotton in face of this regularly increasing demand.

It is not yet twenty years since Middling American cotton was 3d. per pound, but for the past few years it has rarely fallen below 6d. per pound.

The demand outside India for the cotton grown there comes principally from Japan and the continent of Europe; Lancashire and the United States of America are only small consumers. On the European Continent Indian cottons of superior qualities are being employed more and more to take the place of American cotton, and the statistical compilations of the International Cotton Federation, showing the stocks of cotton in the mills of the whole world, on March 1, 1914, indicate the increased use to which Indian cotton has been put during the last year.

The question of the cotton supply should be looked upon from an international point of view, as all the nations are interdependent.

The International Cotton Federation has at all times urged, in the first instance, the growing of larger quantities of cotton in India. Although the question of quality has been looked upon as a point of secondary importance, yet it is one which would naturally receive the attention of the growers.

The results achieved in regard to quality in Madras, in the Punjab, in the Sind and Gujarat are very promising, for taking these together we have had during last season a crop of some 300,000 bales which are of a quality equal to Middling American, though owing to defective picking and mixing the price obtained for these cottons may not have been as high as it might otherwise have been.

It is a mistaken idea to suppose that India can produce only coarse and short cottons. It is an historical fact that India used to produce cotton from which the finest kinds of tissues were woven, and it is only through mixing of different cotton varieties and the lack of scientific supervision that the Indian cottons have deteriorated. I am, however, able to state the experience of many cotton spinners to the effect that the Indian cottons have improved again of late years in quality, no doubt due to the activities of the agricultural experts, and there is every reason to hope that further progress will be made in this direction.

The tour which I undertook during last Winter through the Indian cotton-growing provinces extended to Sind, the Punjab, Northwestern Frontier Province, the United Provinces, Madras Presidency, Central Provinces, Burma, Assam, and part of the Bombay Presidency. Thanks to the excellent arrangements made by the India Office, I was able to make a pretty exhaustive survey of the conditions in the comparatively short time of five months. I will content myself here simply with drawing attention to the salient features of each province, and refer those of you who are specially interested in the question to the report which the International Cotton Federation will issue in a few days.

Sind.

The most interesting development arises from the formation of a syndicate of Bombay mill owners, which has started operations as the result of a suggestion I made four years ago on the occasion of my first visit to India. This syndicate acts as a buying agency for the purchase of cotton grown from American seed, which the Deputy Director of Agriculture has introduced amongst the cultivators in Lower Sind. Unfortunately, this year, owing to unexpected rains in August, this American cotton has suffered severely, almost one-third of the plants having been washed out of the ground, and the color of the lint has been considerably damaged in the remaining plants. Instead of having a crop of 800 bales of American cotton from Lower Sind, only 450 bales have been harvested. This syndicate has also erected a ginning factory in the Upper Sind, but there the cultivation has suffered from a lack of water in the canals. The future of Sind as a cotton-growing area depends largely on the supply of water in the canals, and it has been proved that unless the construction of the Rohri Canal, a project that has been before the public for about thirty years, is undertaken, Sind cannot be relied upon as an annual supplier of large quantities of cotton. It is a great pity that this district, which is very similar to Egypt, is withheld from producing good cotton owing to the impasse in connection with the canal project.

The indigenous Sind cotton is short, but is much appreciated on account of its whiteness.

Punjab.

The outstanding feature of this province is that this season from 25,000 to 30,000 bales of American cotton have been grown in the Lyallpur district. This cotton originally came from Dharwar, but experts agree that the staple and color have improved since it has been taken into the Punjab. The great drawback is that the ginners who purchase the cotton from the cultivators try to mix the local cotton with this Llyallpur-American cotton in the hope of cheating the buyer. The effect is that this cotton mixture is not sold at the price it would command if it were kept pure and that when the seed is used in the second year for sowing purposes the mixture has already taken place. It is of the utmost importance that the Department of Agriculture of the Punjab should undertake a wide distribution of American seed and confine it to certain villages. The more that cotton of one variety is grown in a district the more difficult becomes the task of mixing it with others. In this connection I might say that one of the character-

stics of the Indian is a bent for gambling. No one else in the world is so given to speculating and gambling as the Indian, and although he may have been found out nine times in some underhand practice he will persevere and try the tenth time in the hope that he will not be detected.

The licensing of ginning factories would undoubtedly be a remedy for this mixing.

The Punjab Government has undertaken extensive irrigation works, and besides those canals already supplying water to the northern part of the Punjab there will be inaugurated at the end of this year the Lower Bari Doab Canal, which will supply water to a large tract of country where the prospects of growing good cotton, Lyallpur-American, are excellent. The land is level and therefore most suitable for irrigation, and the clearing will cost comparatively little.

The International Cotton Federation has received the offer from the Punjab Government of a free lease of 7,500 acres of cotton land in the Lower Bari Doab Canal Colony for the purpose of establishing a model cotton plantation and a buying agency. The special features of this undertaking are: Intensive cultivation will be introduced; American cotton, similar to that grown in Sind and the Punjab, will be grown; pure strains of seed will be distributed; and cotton will be bought from the surrounding districts at a premium made known at the time of the planting season. The land has been offered free for twenty years, and in the event of more than 10 per cent being earned, the surplus of profits above that figure will be returned to the Government, thus ensuring that the Indian cultivators will not be exploited. The undertaking is to be an educational movement, for the good of India, and not primarily a money-making venture.

Northwestern Frontier Province.

There are two kinds of cotton grown here. One has a staple one inch long whilst the other measures only five-eighths of an inch. The former is grown on land flooded by hill streams, whilst the latter is grown on canal-irrigated tracts. Unfortunately, the ginning outturn of this cotton is only 25 per cent, but there is no reason why it should not be improved by seed and plant selection. As in the Punjab, so in this province, the mixing of two different kinds of cotton is going on In both cases the ginners, who are the first buyers, and not the growers are the culprits. It is high time that it was realized in India that the shortest fibre in a mixture of cotton decides the price of the whole mixture, just as the value of a chain may be gauged by the strength of its weakest link. The growth of cotton in this province has more than doubled during the last five years, but the possibility of extension is not very great. I recommended in this province the establishment of a cotton market with a Government grader, such as there is in Tokar in the Anglo-Egyptian Sudan.

United Provinces.

In the western circle a white-flowering cotton with a ginning percentage of 39 to 40 has been largely introduced and gives a very remunerative result to the farmers. This cotton is very short, but owing to its high ginning outturn is very remunerative A longer cotton of American origin, Buri, seven-eighths of an inch long, has been introduced as an experiment and promises well. It will be a contest as to whether it will be more remunerative for the farmer to grow the short or the longer cotton. Round Cawnpore, an American variety, is being grown, and 200 bales of this were bought last season by a Cawnpore mill owner at 6½d. per pound. The ordinary cotton round Cawnpore is very short Bengal. There is urgent need for the work of an additional agricultural expert for Bundelkhand, where the conditions are entirely different from those in the Cawnpore area, the soil and climate of Bundelkhand being almost identical with those of the Central Provinces. In Bundelkhand has been inaugurated during the last decade an extensive canal system, but whereas in 1904 it had 160,000 acres under cotton, only 90,000 were cultivated last season with cotton. This is all the more strange as all the other districts of the United Provinces have gradually increased their cotton acreage. The Department of Agriculture holds the opinion that Bundelkhand offers a good future for the growing of cotton.

Central Provinces.

The organizations which assist the Department of Agriculture, and have been created by it, are excellent. Agricultural Unions and Co-operative Agricultural Societies attend to the distribution of cotton seed, and it is probably due to the excellent organization of the Department of Agriculture of that Province that it is now the second largest cotton producer of India. Since 1902, when the activities of the Agricultural Department started, the area under cotton has increased by almost 900,000 acres. The cotton grown generally is short, about one-half of an inch long, but the quantity is large and ever increasing. Cambodia has been tried with enormous success in Chanda on the new Government farm, under tank irrigation; it not only yielded well but produced a lint that has been spoken of by a Cawnpore mill owner as "the best cotton grown in any part of India." The Central Provinces are the new home of Buri cotton, for it is from here that the United Provinces and Assam have received the seed.

It is unfortunate that the good reputation which the Agricultural Department is endeavoring to gain for the cotton raised in the Central Provinces and Berar is suffering largely from the malpractice of watering the ginned cotton prior to pressing. At all the most important centres one can see the hose pipes being used freely, say half an hour over 100 loose bales, and, in spite of the remonstrances made by the spinners of the world it is surprising that the Government of India cannot see its way to suppress this practice, which has been termed a "fraud" by the Secretary of State for India.

Madras.

As regards Madras, an improvement has undoubtedly taken place in the quality of Northerns, which the Agricultural Department has improved by plant selection. A slighter improvement has taken place in the Western cotton but, unfortunately, owing to lack of staff, hardly any work has been carried on by the Department of Agriculture for the improvement of Cambodia. When this Cambodia was introduced it had a ginning outturn of 44 per cent, now it varies from 33 to 35 per cent. With plant selection and importation of new supplies of seed good work might be done by agricultural experts. Spinners complain very much of the falling off in quality of Cambodia cotton. This cotton has one-inch staple and is a phenomenal yielder, as 500 pounds of lint per acre is quite a common crop. As Indian cotton generally yields only 100 pounds per acre, it will be readily understood that many ryots are using all kinds of unsuitable land for the purpose of trying this wonderful cotton. Unfortunately, the Co-operative Credit Societies in Madras are not yet sufficiently developed to take up agricultural work. A great improvement would take place if the Department of Agriculture were to sell selected seed on credit in this Presidency.

Burma.

So far little attention has been paid to Burma cotton. The Government state that about 47,000 bales are grown every year, but last year, and again this year, between 70,000 and 80,000 bales, were exported. Burmese cotton, as now marketed, is a mixture of long and short varieties. The long cotton has a staple of one inch, white in color and silky. It is known under the name of Bhamo

cotton and used to be exported to China. The Chinese insisted upon the different pickings being kept apart, but when about fifteen years ago mechanical ginning factories were started in Burma their managers were not so particular as to quality and insisted upon quantity, with the result that the mixing has continued, and even now no satisfactory difference is made in price for the different qualities or for clean picked cotton. Three large European firms have formed a combine, and, in the absence of effective competition, the low prices paid by the combine to cultivators must result in a reduction in the acreage next year. One advantage has resulted from this combine, and that is that its buyers steadily refuse to accept any seed cotton that has been watered.

Considerable quantities of a coarse cotton giving 50 per cent ginning outturn are grown on the sides of the hills in the Shan States and other hill districts, under perennial cultivation. The method of cultivation is to burn down the hillside and then put in cotton plants and allow them to stay for three years. By that time the soil has become impoverished and the tribes then go to other tracts and start the same process afresh. Owing to lack of staff and railways the Agricultural Department has not been able to introduce more economic methods in these parts.

Assam.

There is a small plantation in the Kamrup plain of Assam, where last year several acres of Buri cotton had been grown as an experiment. The results have been excellent. The spinner who obtained this cotton bought it at the rate of 7d. per pound. The result of this experiment has astonished the officials of the Assam Agricultural Department, who had previously declared that cotton could not be cultivated in the plains of Assam. The Lieutenant-Governor, Sir Archdale Earle, showed great interest in this new venture, and promised that the Agricultural Department should take up the question of cotton growing.

Baroda.

I was exceedingly pleased with the general conditions at Baroda, especially with the Government farm there, under the management of an Indian. Extensive areas are grown under the Cambodia cotton and the Dewan and his officials are evidently alive to the necessity of helping on the Department of Agriculture. Five hundred farmers met at Baroda on February 20 to hear an address from H. H. the Gaekwar on the advantages of Co-operative Credit Societies in relation to the improvement of the cultivation.

The Broach and Nausari cottons of Baroda have a world-wide reputation for their excellent qualities.

Bombay Presidency.

I did not visit, on this occasion, many parts of this Presidency, but I had previously made a thorough investigation. In the north of Bombay Presidency the Government have achieved very good work with regard to improved Broach cotton, and the Bombay mill owners established, on the recommendation of the International Cotton Federation a buying agency, guaranteeing a premium for cotton that had been raised from the improved seed. Unfortunately, last season difficulties arose, but it is hoped that the Government will undertake a stricter superintendence of the distribution of seed and the collection of the cotton from the small farmers.

In the south of Bombay Presidency, in the Karnatack tract, Dharwar and Gadag are the principal centres. At Dharwar we find the only saw-gins in use in the whole of India. Indian cotton is ginned, in general, by roller gins, but here in Dharwar saw-gins are used for the purpose of separating the fibre of American cotton from the seed. Latterly the Dharwar American cotton has deteriorated, and the Government has introduced with success Broach and Cambodia cottons.

Bombay Presidency is the largest producer of Indian cotton, supplying over 29 per cent of the total Indian crop.

Conclusions.

The outlook in general, as regards India as a large supplier of cotton, is most promising, but the Government will have to engage a much larger staff of farming experts. The few who are at present in the Government's employment are a great credit to the British nation, and are the most remunerative investment which the Government of India has ever undertaken. I can prove that in almost every province, through the instrumentality of these farming experts, additional millions of rupees are annually brought into the country.

The Government of India spends about £1 per thousand of the population on agriculture, leaving out veterinary expenditure. Comparisons with other countries show how absurdly small this outlay is. The United Kingdom spends £46 per thousand, Queensland, £92.5; Austria, £86.5; Prussia, £62.5; United States of America and Canada a little over £36; France and Hungary about £27. The "Pioneer" of Allahabad, which supplied this information, in a leading article dealing with an address I gave before the Board of Agriculture, says this comparison is very instructive, and that no one can fail to see State expenditure on agriculture in India is only in its infancy, and that an unanswerable case exists for its expansion.

On my journey I advocated the system of supplying seed on credit, the same as has been introduced by our chairman, Lord Kitchener, in Egypt. All the machinery exists for the collection of the value of the seed through the tax collector. If this method were adopted in India, we would soon see the Department of Agriculture obtaining a monopoly over the supply of seed, and in this way the ryot would gradually free himself from the hands of the money lender. The more general establishment of cotton markets, with Government graders, and possibly in some provinces the licensing of ginning factories, would be effective means of stopping the mixing of the various cottons, for not only is the purchaser cheated through this practice, but much greater harm is done when, in the following season, the mixed seeds are sown in the field. The watering of cotton should be made a penal offense.

I feel convinced that the introduction of such methods as I have suggested would enable India to supply in the near future, say in about five years, a cotton crop of 10,000,000 bales. Cotton is a crop that can be readily converted into cash at any time. It is a crop that requires a food or fodder crop as a rotation and therefore does not interfere with the growing of food and fodder crops. Of course, the man who owns only half an acre must in the first instance devote his land to the raising of food crops. The cottonseed cakes, or better, the meal of these cakes, form, in all agricultural countries, an excellent cattle food which is not yet sufficiently used in India. The meal can be conveniently packed in a small compass and can be transported expeditiously by rail to famine-stricken districts when necessary. These cottonseed cakes have found great favor in England and the United States, and one may justly look upon cotton quite as much as a fodder-producing plant as a fibre plant, seeing that the seed grains are the heaviest portion of the crop.

At present 5.9 per cent of the gross cropped area of India is under cotton, whilst 79.6 per cent is under food and fodder crops; even in famine years India exports foodstuffs. It must be remembered that cotton is a crop that can be warehoused for years without suffering in the least, and as I have shown at the beginning of my paper, there is very little possibility, owing to the ever-increasing demand, that we shall see in the near future low prices prevailing for cotton for any length of time.

Even if Lancashire does not herself use very large quantities of Indian cotton, yet two great advantages accrue to the English

cotton industry from the extension of cotton cultivation in India, viz.:

1. Every additional bale of cotton raised in India liberates a bale of American cotton, and consequently lessens the demand and price for it. Seeing that this year's crop in India will probably amount to 6,000,000 bales, the boon to the cotton industry as a whole, as a result of a crop of these unprecedented dimensions, must have been very great. Had the Indian crop been of normal size, the price of American cotton would undoubtedly have risen to record figures. As it is, the cotton manufacturing industry of the whole world has benefited.

2. Lancashire's secondary advantage is that by extending cotton cultivation in India by improved methods, especially by seed selection, the ryot becomes financially better off, the consequence being that he is able to spend more money on his clothing, of which about 90 per cent is supplied by Lancashire.

Cotton Manufacturing in Belgium in 1913-1914.—The ravages of war have undoubtedly affected very severely the cotton spinners of Belgium. In some of the smaller cotton mill centres,—as, for example, Alost,—the German troops are reported to have destroyed everything, cotton mills with the rest. In the most important cotton manufacturing district, however, Ghent and its environs, the Germans have hardly penetrated at all as yet, and cotton manufacturing is still going on there, though of course in a restricted way. Should the troops of the Allies succeed in interposing their battle line permanently between the German army and the Western portion of Belgium, it is probable that the larger part of the Belgian cotton mills would continue in operation throughout the war, and that the military demands alone for their goods will enable them to dispose of their products to advantage. It is known that Belgian spinners are ready and able to buy cotton at present prices, though probably not as yet in their customary quantities. The assurance that the forces of the Allies could successfully protect Ghent and the adjacent Belgian territory would, however, speedily lead to a considerable demand for cotton. This being the case, it is of interest to have the information contained in a recent consular report to the United States Department of State upon the conditions in the Ghent district during the year preceding the outbreak of hostilities. The reporter is Consul H. Albert Johnson, stationed at Ghent. It is as follows:

"It appears that conditions in the cotton spinning industry of this district during the past year have been far from satisfactory. The climatic conditions reported as especially favorable in the case of the new crop of cotton appeared to have stimulated activity in the market to a considerable extent, when a general strike brought business almost to a standstill. The strike itself was of relatively short duration, but it aroused such serious misgivings concerning its possible effects that it partially paralyzed the industries of this district as well as those of other sections of the country, and the demand for cotton yarns declined to an alarming extent, while prices dropped to an abnormally low level.

"The appearance on the Belgian market at this time of large consignments of cotton yarn from the South of Europe which, owing, it is claimed, to the prevalence of an industrial crisis in that quarter, were offered at exceptionally low quotations, served to neutralize any tendency toward improvement in the conditions prevailing in this locality. Finally, toward the end of August of last year [1913], reports concerning the new crop having been unfavorable, prices gradually advanced, futures being quoted at 93 francs [$17.95 per 50 kilograms, or 110¼ pounds]. Overproduction of stocks being feared on account of the cessation of operations in a number of textile establishments, the Association Cotonniére of Belgium decided to suspend operations in the cotton-spinning mills for six days during November and December [1913].

"At the end of the year the agitation in the case of raw cotton seemed to have subsided, and quotations eventually indicated a retrograde tendency toward a level more in conformity with existing conditions.

"The improvement and extension of dock facilities at Ghent resulted in increasing to a considerable extent the direct imports of raw cotton to this port, and it is predicted that in the near future all vessels arriving in Belgium with cargoes of American cotton will in all probability unload at this port. Direct shipments of Indian cotton to Ghent appear also to have been inaugurated, and it is hoped that this port will in future establish direct connection with the oriental cotton markets.

"The total number of spindles operated in the cotton-spinning industry of this district (including spinning and twisting), last year, was 1,569,452."

* * *

The Market for Cotton in Russia.—A cablegram from Consul General John H. Snodgrass, of Moscow, states that the Russian cotton crop is good; extremely high prices are quoted. American cotton can be sold in Moscow by way of Siberia for lower prices than Asiatic. Home-grown cotton is worth $23.53 per 100 pounds in Moscow. A war tax of $1.43 per 100 pounds on foreign cotton and $2.14 per 100 pounds on domestic cotton is contemplated.

[The Russian cotton district (Turkestan and Transcaucasia) produced 917,352 bales (of 500 pounds each) of cotton fibre in 1912-13, and 1,004,328 bales in 1913-14. Imports of raw cotton and cotton waste into Russia during the first five months of 1914 amounted to 521,200 bales, valued at $36,591,000, as compared with 336,000 bales, valued at $22,088,000, during the corresponding period of 1913.]

W. B. MARSH, Business Manager

SINCE the passage of the Federal Reserve Act by Congress nearly a year ago and its in the main general acceptance by the financial and commercial community, as promising better things than we have ever known in the field of banking and currency, public attention has been chiefly directed to the gradual working out of the necessary organization of the new system. The process of determining the reserve districts and of selecting the cities in which the Reserve Banks should be placed, with the controversies growing out of the disappointment of many local hopes and ambitions when the selection was announced, occupied the public mind for some months. Then came the nomination and confirmation of the members of the Federal Reserve Board, giving opportunity for much discussion of personal qualifications. After this followed the election and selection of the various classes of directors of the Reserve Banks. Before this last process was completed, the outbreak of the European War had thrown the entire financial machinery, domestic and international, of the country into confusion; and the serious question had arisen whether it was safe and prudent to undertake the actual organization as going business concerns of the Reserve Banks, until the times became more propitious. Furthermore, the Federal Reserve Board was hardly completed and organized when certain specific questions of the gravest import had to be presented to it, notwithstanding that it still lacked the actual machinery to make its judgments effective. The paralysis of foreign exchange necessitated action on an unheard-of scale in the way of providing for the indebtedness of the United States; and the tremendous effect which this action would obviously have upon the country's stock of gold was evidently a matter so profoundly concerning the new banking system that our bankers very properly felt obliged to proceed with the sanction of the Federal Reserve Board. Another problem of nation-wide importance was and is that of providing for the satisfactory marketing of our cotton crop, of which an unprecedented proportion must evidently be carried by the South for many months, instead of its being sold immediately to domestic and foreign spinners. Here again it has been clearly necessary that the Federal Reserve Board should take the multitudinous plans of cure under consideration, inasmuch as one of the first perplexities of the entire Reserve System, when put into operation, will be how to deal, in accordance with sound banking principles, with the extraordinary volume of cotton notes and cotton bills which must somehow be taken care of.

All these virtually unavoidable accompaniments of the gradual progress of the Federal Reserve Act towards actual realization in a co-ordinated banking and currency system have had one interesting result for the generality of us, viz., that we have almost forgotten the terms of the Act itself and have for the most part come to assume that with the organization of the Federal Reserve Board and the establishment of the regional Reserve Banks the system will be complete, and ready to fulfil the functions expected of it, as soon as the propitious moment is found for the inauguration of actual business. It is not hazardous to assert that, outside of banking circles proper, not one business man in a thousand in the United States at this moment realizes that even with the Federal Reserve Board and with the organized Reserve Banks, the Federal Reserve System is still not complete in accordance with the terms of the law establishing it. We venture to say that even a considerable number of bankers fail to remember that there remains still another essential member of the system to be provided, the Advisory Council.

In spite of the public forgetfulness and indifference, it is certain that a few at least of the banking fraternity are giving no little thought to this Advisory Council and to the part it will play in the actual operation of the new banking and currency law. This was evidenced in the annual address delivered at Richmond, Va., before the American Bankers' Association, on Wednesday of this week, by the president of the Association, Mr. Arthur Reynolds. The passage devoted by Mr. Reynolds to this point is decidedly worth quoting at the present juncture, if for no other reason, in order that the impending selection of this Advisory Council may not proceed uninfluenced by public discussion of its proper function and of the kind of members of the Council who may be expected to see to it that this function is fulfilled. Mr. Reynolds said:

"During the lengthy discussions over the modifications of the Federal Reserve Act, and especially those relating to the Federal Reserve Board, the bankers of the country exhausted every effort to obtain that representation, by provision in the law, to which their interests clearly entitled them. Failing in that effort, they obtained, in lieu of what they should have had, a clause authorizing an Advisory Council, similar to that in vogue in Germany.

"While the powers of this Council are confined to specified activities, yet from the character and experience of the men who will be chosen by the directors of the various banks, it should wield an influence upon the administration of the system that was denied them in its management. The Federal Reserve Board must convene the Council at least four times a year; and it has the right to make such recommendations in relation to the general affairs of the reserve banking system as its wisdom may dictate. It may also meet at its own discretion and has power to call for the in-

formation to keep it fully advised of events and conditions in all matters relating to the system.

"The experience in Germany has been that the advice of its Council in the conduct of the Reichsbank is rarely refused and generally followed. The result is logical; and as those in charge of the new system become involved in the intricacies of the financial system of this great nation, they may be glad to avail themselves of its assistance. The fundamental features of the bill organizing the Federal Reserve Banks are in the main sound; and the establishment of the Advisory Council may furnish the balance without which the system might be deficient."

It must be said that the reports of the discussions, public and private, at the meeting of the American Bankers' Association, just concluded, have been on the whole indicative of no inconsiderable concern on the part of the bankers who are members of the Association, lest serious disappointments lie ahead of us in the matter of the conduct of the Federal Reserve System. The address of President Reynolds may be asserted to have had this note running through it; and it is significant that his mind should evidently have turned to the Advisory Council, still unconstituted, as the possible protection of the bankers, who must work under the system, from embarrassments, political and other, and perhaps from positive distortion of the entire system from its true purpose. In the Federal Reserve Act the most indistinct of all the provisions are those of Section 12, concerning this same Advisory Council. At first sight, its powers appear to be extensive and important, but a closer examination of the language of the law seems to show them void of that effectiveness which might give their exercise real value and authority. Perhaps it may not be a waste of space to rehearse briefly the precise terms of this Section 12 of the Act, despite the fact that Mr. Reynolds has done this in a general way. In the first paragraph it is provided that the Advisory Council shall consist of as many members as there are Federal Reserve Banks and that "each Federal Reserve Bank by its board of directors shall annually select from its own Federal reserve district one member of said Council." Meetings of the Council are to be held in Washington at least four times a year, "and oftener if called by the Federal Reserve Board." But the Council may also hold meetings of its own motion, either at Washington or elsewhere; and it has complete control over its own organization and procedure. In only one respect is it wholly subject to the final authority of the Federal Reserve Board, namely, as regards the compensation and allowances of its members, although these are to be originally fixed for each member by the board of directors of the Reserve Bank that appoints him. It is in the second paragraph of Section 12 that we find the enumeration of the powers granted to the Advisory Council; and scrutiny of the terms employed shows these powers to be as remarkable for their inclusiveness as they are noteworthy for their complete lack of substantial effectiveness. The entire paragraph may well be quoted:

"The Federal Advisory Council shall have power, by itself or through its officers, (1) to confer directly with the Federal Reserve Board on general business conditions; (2) to make oral or written representations concerning matters within the jurisdiction of said board; (3) to call for information and to make recommendations in regard to discount rates, rediscount business, note issues, reserve conditions in the various districts, the purchase and sale of gold or securities by reserve banks, open-market operations by said banks, and the general affairs of the reserve banking system."

Here is a wide range of matters, virtually all of them demanding highly expert knowledge and long experience on the part of those dealing with them; and the Advisory Council is empowered and by implication directed to procure information about them and to impart this information, accompanied by recommendations, to the Federal Reserve Board. This latter body, however, need do no more, under the terms of the law, than throw the recommendations into the waste-paper basket. It is not required to heed them at all in the actual conduct of the affairs of the Federal Reserve System. Hence a question not unnaturally rises as to what purpose this Council was intended by the legislature to subserve and as to what function it will finally be found to fulfil in the economy of the new banking and currency system as a whole.

It is well enough known that the prototype of this Advisory Council was found in the Council representing the interests of the stockholders of the German Reichsbank and actually, though without legally effective powers, controlling the conduct of the business of that institution. Nominally, public officials carry on the Reichsbank, but in real truth these officials always heed the recommendations of the shareholders' Council. It is perhaps no secret that the suggestion of the incorporation of this provision in the Federal Reserve Act came originally from the eminent English financial authority, Sir George Paish, who had been struck with the important part played by the shareholders' council of the Reichsbank and who conceived that a similar council, representative of American bankers as a class, might diminish the danger that our new Federal Reserve System may have over-much of political management about it. There is no denying, then, that the principle has been tried and has been found to work well, at least in the environment in which it has been tried.

What is primarily important to Americans, however, is the part which the Advisory Council will obtain for itself in the direction of our reformed banking and currency. And this, as we see it, is something which will lie almost wholly in the hands of our bankers. It lies within their power to make the Advisory Council of importance or not, according as they treat seriously or not the selection of the men who will compose it. If they resolutely and speedily set about procuring from the boards of directors of the district Reserve Banks the nomination to the Advisory Council of powerful and experienced men, who will regard their duty as being the largest and most continuous possible informing of the Federal Reserve Board, on the one hand, and of the public, on the other, as to the commercial and industrial, the financial and economic conditions throughout the country, and as to the banking requirements inherent in these conditions, the Advisory Council so composed will quickly become the predominant influence in directing the policy of the entire Federal Reserve System; and this will be the case, notwithstanding the lack of positive legal authority and control. On the other hand, an Advisory Council composed of men selected for reasons of a purely honorary kind will just as quickly become a mere fifth wheel of the coach, and bankers will have no direct representation of their interests with the Federal Reserve Board.

Arthur Richmond Marsh

THE BELLIGERENT COUNTRIES OF EUROPE AND THE GOLD STANDARD

AT the time of the American Civil War the fundamental principles of banking and currency were far less completely understood than they are to-day and the financing of the war by the United States Government was in the main empiric, rather than scientific. Everybody is now familiar with the consequences of the course pursued, though it is improbable that any one at the time, at least in this country, anticipated those consequences. In order to pay the immediate cost of the conduct of the war, the Government first borrowed as much as it could in the open market, then had recourse to so large an issue of pure fiat money (greenbacks) as to threaten the complete demoralization of the country's entire finances, and finally took refuge in the National Banking System, which provided a market for the bonds of the Government because these could immediately be turned into currency by the National banks. The aggregate amount of currency in circulation was enormously increased by the two last of these processes; the internal money of the United States separated itself very widely from the gold money of European countries; and a tremendous enhancement in the prices of commodities, in terms of United States money, almost immediately ensued. Long years were required to reduce the currency once more to a gold basis; and in the meantime one of the heaviest burdens upon our industry and trade was the constantly fluctuating rate of exchange between our paper currency and gold.

The European War, involving so stupendous an immediate expenditure on the part of all the chief industrial and commercial countries abroad, raises the very important question whether these countries, in spite of the supposed perfection of their banking systems, will be able to avoid precisely what happened in the United States during the Civil War. Will it be possible for these countries to maintain such a relation between the amount of their outstanding currency and their supply of gold that the two will not, so to speak, pull apart, with the result that the countries will find themselves at the end of the war with enormously redundant paper currencies, greatly depreciated in comparison with gold, which they can bring back to the gold basis only after a long period of time? The theory of modern banking is that a country's currency should represent in certain proportions gold and the continually liquidated credits given by banks on commodities in course of production and distribution. A currency resting upon essentially permanent and unliquidating credits, such as government securities, is held to be unscientific and pernicious. But can the European countries find the wherewithal to meet their current war expenses, without giving rise to a vast currency supported only by these governmental credits? And, if they cannot, must not the effect be vast amounts of practically irredeemable currency, with all its consequences in greatly enhanced prices for goods within the countries so situated and with a long continued disturbance, both of the domestic exchange between gold and currency and also of the international exchanges between these countries and those other countries of the world which have succeeded in maintaining the gold standard, as the United States and probably England and her dependencies?

These possibilities are suggested by paragraphs in a recent number of "The Economist," of London, in which the reported successful domestic flotation of Germany's war loans is subjected to critical analysis. These paragraphs are as follows:

"The official statement received from Berlin through Amsterdam on September 24, declares that 13 hundred million marks of the war loan (about 66 million sterling) have been issued in 5 per cent Exchequer bonds and 3,071 million marks (about 153 million sterling) in the Imperial 5 per cent loan, both at 97½. At this price the bonds give a yield of £5 11s. 8d., and the loan yields £5 2s. 7d. The total of 4,389 million marks is imposing, but is susceptible, we think, of an explanation.

"What happened doubtless is that the German Government told the German banks what amounts they must apply for. There is no need to suppose that their clients have been able to provide more than a tiny fraction of the amount, and if our view is correct, we may confidently expect continued issues of German paper money, which will be followed by a great rise of prices in Germany.

"On the other hand, there is doubtless enough wheat and rye in Germany to supply the whole population with bread for many months to come, and the Government, by controlling the supplies of the shops, can fix the prices of this first necessity of life. Germany will also be able to exchange its large surplus of sugar, and its surpluses of dyestuffs, drugs, and chemicals, potash, and coal, etc., for other things which it will most need, with Denmark, Scandinavia, Holland and Switzerland."

An analysis of the weekly figures of the Reichsbank, as they are now reaching us in their new form which makes impossible comparisons with the past, would seem to bear out the suggestion of "The Economist." Thus, for the week ending July 25, the bank note circulation of the Reichsbank was only 1,890,893,000 marks, while for the week ending October 12 it had risen to the unprecedented total of 4,382,902,000 marks, having gained the huge amount of 292,014,000 marks in a single week. Nor does this tell the whole story; for, at the same time, there was during the past week a gain within the Reichsbank itself of no less than 690,781,000 marks for the practically new item of "Bullion (silver), bank notes and Treasury notes." And at the very time when these great increases in the paper circulation were most marked,—i. e. the week of October 5 to 12,—there was a tremendous decrease in the amount of the Reichsbank's holdings of the chief basis of its note issues, other than gold, viz. discounted commercial bills and security carry-overs. The shrinkage in this item for the single week just past has been no less than 1,455,735,000 marks. In other words, the Reichsbank's weekly statements are now showing a very rapid increase of the note circulation, with an even more rapid decrease of the very items which theoretically should form the only basis for note issues except gold. It is true that the past week's statement shows some increase in the Reichsbank's gold holdings, 54,629,000 marks, representing doubtless the hoarded money which is being forced out of the hands of those who withdrew it from the banks during the past eighteen months and who must now part with it in order to live. But this gain in gold is insignificant in comparison with the increase in paper money put in circulation at a time when commercial paper is shrinking most severely. The conclusion, then, seems to be inescapable that the increase of the note issues really represents, directly or indirectly, the indigestible government loans.

But this carries us straight back to what happened in the United States at the time of the Civil War, i. e. issues of government bonds, for the taking up of which there was no real capital available and which consequently had to be translated at once into bank note issues by the National banks subscribing for them. The redundancy of the virtually irredeemable paper money thus issued speedily split it away from gold; Gresham's law came into full operation, and the gold was to all intents and purposes driven out of the country (except, of course, in so far as it was absolutely required for international exchanges); prices, in terms of the paper currency, rose violently and stood out of all certain relation with

prices in the gold countries abroad; and for a quarter of a century the commercial and industrial activities of the country were hampered by uncertainty as to the value, in relation to gold, of the monetary unit by which all interchanges of commodities, present or future, had to be measured and liquidated.

The present indications, then, point to an enforced abandonment of the gold standard by more than one of the countries now involved in the European War. If the war lasts a year or more, it is hard to see how any of them, except England with her enormous income from foreign investments, particularly in non-European countries and her unequaled credit, can avoid this unhappy disturbance of their currency systems. Perhaps France may escape, if the war is not too prolonged; but this is doubtful, because France has been too much given to investing in the governmental securities of Europe alone.

One more point of no inconsiderable importance may be mentioned. If the above reasoning be correct, American business men selling goods for future payment or for future delivery and payment to the European countries likely to be affected should begin at once to stipulate payment in gold. It may be highly unpleasant, for example, for a merchant who has sold cotton to Germany (if a way be found to do this), to discover that gold in Germany has suddenly advanced, say to par and one-half in the Germany money which he must accept in payment of his account, because his contract fails to stipulate that he is to be paid in gold. The same principle, of course, applies to bank balances and balances of account which Americans may have in Germany. The more quickly these can be withdrawn, either in the form of credits in countries unlikely to have to depart from the gold standard or in commodities still selling at gold standard prices, the less the risk of a severe shrinkage in them, when the flood of bank notes, or paper money, issued to finance the war, shall have produced its inevitable effects.

THE QUESTION OF INCREASED TRADE BETWEEN THE UNITED STATES AND RUSSIA

THE signing at Washington of a peace treaty between the United States and Russia, similar to the treaties concluded with Great Britain and France on September 15, points decidedly toward the renewal of commercial as well as political friendliness between this country and Russia. This may well lead to a new commercial treaty, to take the place of the convention of 1832 between the two countries, which was abrogated by Congress several years ago.

The signing of this Russian treaty follows close upon a highly interesting and significant statement of M. Sazonoff, Russian Minister of Foreign Affairs, quoted in a dispatch from Petrograd to the London "Times" and reproduced in various American papers, of which the essential portions are as follows:

"The present situation furnishes the greatest commercial opportunity to England and America that has been offered. Germany for years past has been vigorously pushing her trade in all quarters of the Russian Empire. She now sells us $300,000,000 worth of products yearly. These enormous markets in machinery, chemicals and all sorts of manufactures are now suddenly cut off from her.

"America and England should send experts here now, while the war is in progress, to study our wants, import duties, and methods of business, so that when peace comes the channels which for decades have flowed deeply with German products will continue to flow deeply with English and American products.

"For America especially Russia opens an industrial outlet such as can hardly be overestimated. We have an empire of 170,000,000 souls, and what we have been paying Germany yearly is but the beginning of a demand that soon will make Russia among the most desirable and valuable markets in the world.

"Railroad building and new developments everywhere are a prelude to an era of prosperity in this country such as never has been seen here before. I cannot too emphatically express the hope that merchants abroad will realize this wonderful opportunity and act promptly."

In the light of this persuasive statement of M. Sazonoff, it becomes particularly worth while at this time to review briefly the economic conditions existing in the Russian Empire, with a view to estimating the opportunities which actually exist for increasing the trade between the United States and that vast country for which so much is promised both in the near and in the more distant future.

Russia, European and Asiatic, comprises about one-seventh of the land surface of the globe, with an area of nearly 8,500,000 square miles. The area of the United States, including Alaska, Hawaii, and Porto Rico, is approximately 3,500,000 square miles. Notwithstanding the common impression of Russia's Northern bleakness and consequent lack of real productiveness, great portions of Russian territory are exceedingly fertile. The vast area of European Russia may be imagined as consisting of three successive broad belts running from Northeast to Southwest,—the forests, the black lands, and the steppes. Deep forests cover the entire northern section, and in great clearings have been built many of the older Russian cities. South of the forest belt lies the belt of black lands, which are hardly equalled in their fertility by the lands of any other country. South of the black lands are the steppes, or prairies, so rich that on them grows grass higher than men's heads. The black land belt and the steppes are the great grain producing areas. Thus, the country affords a fruitful and ample theatre for the operations of a numerous race. In the words of the French economist, M. Paul Leroy-Beaulieu: "Man meets there only two obstacles,—cold and space. Cold, more easily overcome than extreme heat and less to be feared by our civilization; space, an enemy already mastered by Russia, and become its great ally for the future."

Another notable characteristic of the Russian territory is its physiographic unity. Unlike Western Europe, broken up and divided by its mountain ranges, its gulfs and bays, Russia in Europe is practically a continuous unbroken plain. This geographic fact obviously has an important bearing on the homogeneity of the people, and their ability to absorb alien races.

As to the population, the best available estimate is 175,000,000 souls, but distributed very unevenly. In the extreme North and South the population is not very dense; but in the Southern part of the forest belt, on the black lands, and in Poland the country is thickly settled. The population of the largest cities is, in round numbers, as follows: Petrograd (1912), 2,000,000; Moscow (1912), 1,600,000; Odessa (1911), 620,000; Kiev, (1911), 500,000; Warsaw (1911), 870,000. These are the only cities with population of half a million. While there is a mixture of many races in the Empire as a whole, yet, as has been suggested, the character of the country, and possibly the form of government, have tended to amalgamate and blend together these races more fully than is popularly supposed. To quote M. Leroy-Beaulieu again: "With all its diverse races, Russia is by no means an incoherent mass, a sort of political conglomerate or marqueterie of peoples. It resembles rather France than Turkey or Austria in the matter of national unity. If Russia can be compared to a mosaic, it is one of those ancient pavements where the basis is of a single substance and a

single color, and whose surface only is made of an embroidery of different pieces and diverse hues."

But from a commercial and industrial standpoint, it may fairly be said that the greatness of Russia is still largely potential. This will appear from a comparative view of her farm lands and forests, and her foreign trade. First, as to farm lands. There are in the Russian Empire, if available statistics are to be trusted, not quite 275,000,000 acres under cultivation. In the United States, the improved farm acreage is nearly 490,000,000. The forest area can be reckoned accurately only for European Russia, Finland, Poland and the Caucasus. In these regions the total reaches 550,000,000 acres, about 40 per cent of the area of these parts of Russia. The forest acreage of the United States is approximately 545,000,000 acres, which is not quite 25 per cent of our total area.

As to the foreign commerce of Russia, it is worth while to survey this somewhat in detail. In 1913 the total value of imports was $610,000,000, as against the $1,790,000,000 of the United States, the $2,755,000,000 of Germany, and the $3,740,000,000 of Great Britain. Russia's exports for 1913 were valued at $710,000,000, as against the $2,485,000,000 of the United States, the $2,305,000,000 of Germany, and the $3,090,000,000 of Great Britain.

The value of Russia's imports from and exports to three leading nations was as follows:

RUSSIAN FOREIGN TRADE, 1913.

	Imports from	Exports to
Germany	$322,000,000	$226,000,000
United Kingdom	85,000,000	134,000,000
United States	37,000,000	7,000,000

This table brings out sharply a vital point to be considered in connection with any movement in this country to act upon the suggestion of the Russian Foreign Minister, namely the proximity of Germany, and the complementary character of her industrial and commercial wants with those of Russia. Unquestionably a certain natural advantage in respect of Russian trade accrues to Germany from these facts, as has been pointed out by an editorial writer in the New York "Journal of Commerce," who remarks:

"Germany has the same advantages in dealing with Russia that we have in our commercial intercourse with Canada—that of geographical contiguity. Thus Germany can get her goods into the Russian markets usually at the cost of one 'handling' and one train journey at fairly moderate rates. These advantages have been reinforced by the provisions of a particularly broad and liberal commercial treaty in which the balance of profit was emphatically on the side of Germany.

"The result was shown in the rapid expansion of German exports to Russia in the course of the last twenty-five years. For the five-year period 1889-93 German exports to Russia had an annual average of $38,770,000; while for the five-year period 1904-8 the average per annum was $108,275,000. Here was an increase in twenty years of $70,000,000 in the annual average of Russian imports from Germany. During the same period the annual average of imports from England increased only from $28,220,000 to $49,050,000."

It is also notable that the Russian imports from the United States have consistently fallen off during the last three years. They were $37,000,000 in value in 1913; nearly $43,000,000 in 1912; and over $50,000,000 in 1911. The exports to the United States, valued at $7,000,000 in 1913, showed a falling off from the 1912 figure, which was nearly $9,000,000, but was slightly in excess of the 1911 exports, which reached a value of nearly $6,750,000. During the same years the Russian imports from Germany have shown a steady increase, though the exports to Germany showed a falling off in 1913, as did the total value of exports from the Russian Empire. Of course, some allowance must be made in judging the commerce between Russia and the United States of late years for the lack of a commercial treaty between the two countries.

It will now be of interest to show analytically the character of goods which at present are comprised in our Russian trade. It appears from the governmental statistics that the principal imports from the United States into European Russia are as follows:

RUSSIAN IMPORTS FROM UNITED STATES, 1913.

Raw cotton	$23,282,000	Scientific apparatus	129,000
Agricultural machinery	3,679,000	Jute and jute tow	116,000
India rubber and gutta percha	3,066,000	Hides and skins	98,000
Machines and machinery	2,999,000	Copra	88,000
Manufactures of wood	633,000	Cast iron manufactures	63,000
Automobiles	291,000	Hand tools	49,000
Mineral oils	187,000	Mineral and vegetable wax	17,000

While these figures, in their relative proportions, are probably correct enough, the total figures are certainly too low; for it is well known that a large amount of American merchandise is shipped to Russia through other European countries, whose agencies exact a profit for the transactions, and at the same time swell their own export figures beyond the mark set by their native products. On this point, Mr. J. D. Whelpley, in his instructive book, "The Trade of the World," has said: "There is reason to believe that American sales of one item alone—raw cotton—exceed the total officially stated value of Russian annual imports from the United States ($37,000,000). The annual consumption of raw cotton in Russia is approximately $125,000,000. Fifty million of this is grown in Central Asia; $25,000,000 comes from Egypt, India, and other places, leaving at least $50,000,000 worth to be bought from the United States, as there is no other place from which it can come."

But even after making all possible allowances we are tremendously far behind Germany in our trade with Russia, and that, too, after all proper deductions are made from the German export figures for American commodities, like cotton, re-exported to Russia. As compared with our $291,000 worth of automobiles exported to Russia, Germany in 1913 exported thither automobiles to the value of $6,005,000; our cast iron exports to Russia were valued at $63,000, Germany's at $1,552,000; and so on, until we reach the total of $332,000,000 in value of goods exported by Germany into Russia in 1913, as compared with our figure of $37,000,000 for the same year. In short, Germany's position is strategic. Her exports to her Eastern neighbor in 1913 included woolen goods to the value of over $6,000,000, while those of the United Kingdom, which is commonly supposed to dominate the woolen goods markets of the world, exported to Russia last year only $1,285,000 in such goods.

Nevertheless, it is quite possible that war conditions have created new opportunities for American exporters. Certainly, the suggestion of the Russian Minister that experts be sent to Russia "to study (her) wants, import duties, and methods of business" is worthy of careful consideration. Assuredly, everybody who believes in the ability of American merchants to solve the difficulties which problems of this character present should desire to have M. Sazonoff's suggestion and, indeed, invitation, taken up and examined in the light of the materal facts upon which action, whether individual or co-operative, must be based. Thus it may be possible to avoid the waste of misdirected enthusiasm and energy, excited by a tempting general appeal, and to turn the attention and efforts of our exporters to the fundamentals of their task.

It will require all their native energy and more than ordinary skill in export matters permanently to divert streams of American merchandise into what M. Sazonoff has called "the channels which for decades have flowed deeply with German products." This is not to imply that, with good relations between the two countries, both so vast in their economic possibilities, the commercial inter-

course between the United States and Russia may not be very rapidly amplified with much profit to both sides. But it were idle to hope that what amounts to a commercial revolution can be accomplished out of hand.

AN ENGLISH VIEW OF THE FIVE PER CENT INCREASE OF FREIGHT RATES CASE

By W. M. Acworth

Reprinted from the "Railway Age Gazette"

I AM invited to say what I think of the recent 5 per cent rate advance case. Let me begin by making my own personal attitude clear. Three or four years ago I started to write a continuation of my little book, "Elements of Railway Economics." Several of its chapters as they were written appeared in the "Railway Age Gazette." One chapter concluded in these words: "A law court is not a proper body to decide questions of railway rates. On the other side of the Atlantic they seem to be gradually working out a system of regulation much more logical in theory, and likely in the long run to be much more satisfactory in practice." I then held the belief—justified I think by the then evidence—that commission control was going to afford a satisfactory solution of the problem. And I accordingly went on to sketch its gradual development in the United States, showing how commissions and legislators had sown their wild oats, and how the railroads had come, first reluctantly to submit to, and then almost to welcome, reasonable regulation.

And then two years ago my writing abruptly stopped; for the facts unfortunately ceased to fit the theory on which I was proceeding. Legislators refused to be guided by experts, and passed two-cent fare laws, full crew laws, and the like, by scores, for reasons quite other than those of general public interest. Commissions failed to become more expert. They still regarded it as their duty to establish, not just and reasonable rates, but low rates. Some of them even, in defiance of the spirit of the Constitution, which forbids any State to lay any imposts or duties on imports, manipulated local rates so as to prejudice the freighters, outside their own State. There remained still the Interstate Commerce Commission. And to that commission, strengthened in authority, in numbers, and in personnel, one could surely look to uphold the credit of commission control. And now comes the decision of that commission in a case, not only the most important that has ever been submitted to it, but surely the most important in the magnitude of the interests involved that ever has been submitted in the world's history to any tribunal. That the decision will be a landmark in the story of the relations between railways and governments, I have no doubt. That it will inspire confidence in commission control as a system—can any one hope?

I am not going to attempt to criticise the decision in detail; as it seems to me details are out of place in a case going down to the whole financial basis of the railroads of America. Three years before the commission inquired into the same question, whether an advance of rates was required. Though they came, as I believe, to a wrong conclusion, they dealt with the matter in a broad and statesmanlike manner. They based their judgment that an increase was not required on the view that new net revenue was not then needed, and on the expectation that neither wages nor cost of supplies would much advance; and added that, if they were proved wrong, they would not hesitate to give their sanction to increases that would be reasonable. In 1914 the commission finds that the expectations of its predecessors of 1911 were wrong. Wages and fuel costs have largely increased, and "the net operating income of the railroads in official classification territory, taken as a whole, is smaller than is demanded in the interests of both the general public and the railroads." But thereupon the commission decided that the railroads in official classification territory, taken as a whole, shall not receive at their hands any increase of income whatever.

The commissioners of 1911 were bad prophets. But fate was at least kinder to them than to the prophets of 1914, who—on the very day on which the stock exchanges in New York and London closed their doors, and two days before Germany declared war on France and Russia—put out the opinion, "Shortly after the commencement of this proceeding there began another period of depression from which we appear now to be recovering." * * * "Subsequent developments have shown that there was little foundation for any such view" as that "carriers would encounter great difficulty in renewing their maturing short term notes and other obligations. With the growing ease in the money markets this difficulty has largely disappeared."

But in truth this was not a case either for detail or for prophecy. In England our courts take judicial cognizance, as it is called, of certain facts that do not need to be proved. They take it for granted, for instance, that the sun goes around the world; that New York time is always five hours behind London; that the United States since 1776 has been an independent nation, and other similar facts that are part of our common consciousness. And so, it seems to me, the commission might have taken judicial cognizance of the elemental facts of the railway situation. We all know, for example, that American railways have been built and operated hitherto with an economy unknown in older countries; but that of recent years the standard of construction, and the standard of operation have been rapidly raised, implying the expenditure of vast additional capital and a much larger proportion of income. We know that freight rates the lowest in the world have gone down rather than up of recent years. We know that operating costs have increased faster owing to increased prices than could possibly be offset by increased economies. We know, to put it in the broadest possible way, that it cannot in the long run be possible, in a country where $1 purchases less than almost anywhere else in the world, to give the European standard of service at the old American standard of price. We—including the commission—cannot help having all these things at the back of our heads, and 1,000 pages of statistical tables do nothing more than confirm—though they do abundantly confirm—our pre-existing impressions. And yet the answer of the commission is a refusal, and ten items of paternal advice.

One would have thought the natural course of the commission, having found the net revenue inadequate, would have been to go on to say: "Take then, as an interim measure, this 5 per cent increase for which you ask, for you have abundantly discharged the burden of proof laid upon you that your rates as a whole are too low. But the general increase must of course be subject to the right of any individual complainant to show that his case is an exception; and, if that is proved, the money must of course be refunded. But we do not think that a general 5 per cent increase is the best thing that can be done. Let us all get together, commission, railroads and freighters, and see if we cannot work out a better scheme, it being understood that the commission has made up its mind, on the one hand, that the railroads must have increased revenues, and therefore increased rates; and, on the other hand, that no trade and no locality must be unjustly discriminated against."

But, far from taking this course, the commission have intrenched themselves in a semi-judicial dignity against "the general impropriety" of what they call "the campaign of publicity." Why

there was any impropriety in the action of the Traffic Association which "offered to deluge the commission's offices with thousands of telegrams"—presumably to declare that, in the opinion of the members of the association, the proposed increases were just and reasonable—it is difficult to understand. I had always hitherto believed that the great advantage of a commission of the American type over our purely judicial commission in England was precisely that with you the commission was responsive to public opinion, both guiding it and being guided by it in turn; and was not confined to the consideration of sworn evidence produced in court. In our procedure there is no method by which the interests of the public at large can be brought before the court. But, if with you the public at large, who are expressing their opinion through hundreds of leading articles or through thousands of telegrams, are to be refused a hearing, what is the advantage in the commission being only "semi-judicial?"

I have long thought that the proper method of control over railway rates is that a body of experts, such as the commission, should consider the question, and, instead of deciding it, should publicly give their advice to a cabinet minister, and that he should then act on his own responsibility, being himself in turn responsible to Parliament. Under our form of government in England there is no difficulty in establishing machinery of this kind. But it would, I imagine, be impossible under your Constitution with its rigid limitations of the sphere of legislative, executive and judicial action. But you will, I think, have to face the question, how the statesmanship of the country can be brought to bear on the railway problem; for this question the Interstate Commerce Commission by its latest decision has raised in so acute a form that it cannot now be evaded.

INDUSTRY, COMMERCE AND FINANCE

British Trade in September.—According to the estimate of the Board of Trade British imports fell off $81,515,000 in value, and exports $18,750,000 in value, as compared with figures for September, 1913.

The principal declines in imports were: Food, $10,000,000; wood, $11,250,000; cotton, $7,500,000; manufactured articles, $42,500,000.

In exports, coal fell off $8,750,000. The remaining deficit was in manufactured articles, of which cotton textiles figured to the amount of $17,500,000.

The following figures show the value of imports and exports for the past four months, as compared with the values for the same months in 1913, and the total value for the first nine months of 1914 and 1913:

BRITISH IMPORTS AND EXPORTS, 1913 AND 1914 (IN PART).

Imports.	1914.	1913.
September	£45,056,086	£61,359,086
August	42,362,034	55,975,704
July	59,383,792	61,783,683
June	58,272,042	58,309,519
Exports.		
September	£33,527,877	£49,277,877
August	28,631,104	52,261,228
July	52,231,296	55,475,551
June	48,626,410	51,377,685
Nine Months.		
Imports	£522,635,714	£557,807,499
Exports	429,124,314	473,126,041

* * *

Production of Silica in the United States.—The marketed production of silica in the United States in 1913, as reported to the United States Geological Survey, was 232,192 short tons, valued at $953,832. The general term silica includes vein quartz, sand and crushed sandstone, tripoli, and diatomaceous earth. The marketed production of quartz in 1913 was 97,902 short tons, valued at $201,488, against 97,874 short tons valued at $191,685 in 1912. There was a total production in 1913 of 106,857 short tons of sand and sandstone used in paint fillers, polishing powders, scouring material, etc., valued at $466,523. The production of tripoli in 1913 was 20,831 short tons, valued at $215,617. The total output of diatomaceous earth in 1913 was 6,602 short tons, valued at $69,304.

* * *

United States Borax Production in 1913.—In 1913 the production of crude borate materials in the United States was 58,051 short tons valued at $1,491,530, compared with 42,315 tons in 1912 valued at $1,127,813, according to an advance chapter from Mineral Resources 1913 on the production of borax, just published by the United States Geological Survey. All the borax in the United States is produced from ores derived from California, and mainly from a few mines in Inyo and Los Angeles counties, although a small quantity was produced in Ventura County. Thus far there has been no output of borax from the potash properties in the Searles Lake region, where the promoters expect to obtain borax as a by-product of the potash mining operations. The imports into the United States in 1913 of borax and borates were valued at $18,434, against $11,249 in 1912.

* * *

The World's Production of Coal and the Part of the United States Therein.—A recent paragraph in the "Coal Age" calls attention to the opportunity of the United States in the coal industry arising through the war in Europe. The statement is as follows:

"The annual producion of coal in the entire world is approximately 1,350,000,000 short tons. The United States produces 575,000,000, or more than 42 per cent. Great Britain produces about 305,000,000, or 22 per cent, while Germany produces 265,000,000, or 19 per cent. Other countries in their order of production are Austria-Hungary, 50,000,000; France, 45,000,000; Russia, 28,000,000; Belgium, 25,000,000, and Japan, 19,000,000 short tons. It is true, therefore, that of eight countries producing 97 per cent of the world's coal output, the only one not now engaged in war is the United States.

"Great Britain is still producing a large tonnage, and is endeavoring to maintain her place as the world's most important exporter of fuel. Her foreign business in coal amounts to approximately 110,000,000 tons annually, leaving 195,000,000 tons for domestic use. There is no doubt but that production in Great Britain will be curtailed, but it is likewise certain that her domestic consumption will materially lessen, so that considerable coal will still be available for export. She has ships, and commands the seas, so that she must be regarded still as a most formidable competitor for the export business. The chief condition against her is the recent order prohibiting the export of her best Welsh grades. We doubt if importers will be satisfied with an inferior English coal.

"In Germany, Austria-Hungary, France and Belgium, the coal industry is completely demoralized, only enough colliers being left in the mines to supply fuel for the railways, armament mills and the more important national requirements. Japan can hardly supply enough coal for her own uses, so it is evident the United States and Great Britain must furnish the world's fuel while the present war continues.

"If the present time is not the supreme opportunity to make the United States the chief fuel exporting nation of the world, then surely the chance will never come."

INSURANCE

Articles on the Theory, Practice and Experience of Insurance.

Notes on Insurance, American and Foreign.

Items of Insurance News.

THE article upon life insurance policy loans, as a national help in time of war, by the distinguished German financial writer, Herr Georg Bernhard, of which a translation is published on other pages of this paper, not only throws interesting sidelights upon the inner financial situation in Germany since the outbreak of the European War, but also suggests economic questions of a far-reaching kind, both for life insurance itself as a business and for those who would find an adequate theoretic correlation of life insurance with all the economic forces and resources of a country. It is a marked characteristic of the earlier history and development of life insurance that the individual and personal side of it was chiefly emphasized in all thinking and speaking about it. The appeal to the sense of duty in the head of the family, in respect of the protection of those dependent upon him against penury in case of his death, was from the start the driving force of life insurance. In this country the enormous growth of the capital resources held by life insurance companies has, of course, led to comment of a descriptive, but not analytical, kind. The importance of the companies in the financial markets has been recognized; and the economic benefits in some other directions of the vast amounts of accessible capital gathered together by the companies have been pointed out. But we do not recall any attempt in this country at a thorough-going study of the place of life insurance in the total economic and social activities of the community, or of the means for making life insurance a positive force of a calculated and adapted kind in the promotion of those activities.

The Germans are much more given than we are to looking at great businesses from the point of view of the community as a whole and of its co-ordinated welfare, progress and protection from disaster; yet even they, as Herr Bernhard says, have paid too little attention in the past to the functioning of life insurance in such wise that it may serve not only private, but also public ends. Coincident with the great advances in industry and commerce made by Germany in the last forty years, German life insurance has developed with great rapidity, though by no means so extensively as in the United States. Yet even so no inconsiderable percentage of the total wealth of Germany is devoted to life insurance, and a multitude of individual Germans have made life insurance an integral part of their economic life. And, rather resisted than encouraged by the life insurance institutions, these individual Germans have inclined to push life insurance beyond its original narrow bounds, and to combine with it the process of saving in general. In this way the amount of capital controlled by the life insurance companies has been greatly swelled, while at the same time it has been in a sense substracted from the aggregate of free capital in the country. It cannot easily be turned to meet imperative financial and commercial needs in a period of extreme stress. From the German point of view this is to have life insurance in a sense a social and national detriment, instead of a blessing.

The war, with its terrific strain upon all the resources of Germany, is bringing questions of this kind out into the full light of public discussion and is driving German statesmen and publicists to scrutinize as never before the remote effects for the State of all the larger business activities. Unless the economic situation can be maintained sound for the great body of the German population, it is certain that sooner or later the country must be worn out by the struggle and be obliged to succumb to its enemies. And in this respect it is quite as important that the smaller and weaker economic units of the population should be sustained, as that the relatively few great businesses should be kept going. But with every industry and every branch of commerce suddenly subjected to violent restriction, the smaller people can survive only if they can employ their saved-up capital to tide them over until the end of the war. It has suddenly become a more imperative duty for them to live now and to keep their families alive, than to provided for their families after their own death. They have saved and they need to draw upon their savings now; but if these savings are withheld from them on the ground that they are dedicated to life insurance, they must lose even that which they have.

The problem is not one to be dismissed lightly, nor is it without significance for other countries than Germany, even the great and rich United States. It is, of course, obvious to any one familiar with the business of life insurance as it is, that Herr Bernhard, in his impatience for quick relief from an unexpected embarrassment of his war-strained country, is demanding of the German life insurance companies something which it is physically impossible for them to give. It is out of all question that these companies should grant to a multitude of their policyholders loans approximating the amount of the accumulated reserves on their policies. Herr Bernhard's own statement that over four-fifth of the assets of the most important German companies are invested in mortgages quite demonstrates that no considerable number of the policyholders of these companies can be granted policy loans even remotely approaching the theoretical loan values of their policies. At a time like this, the mortgages held by the companies as investments are utterly unsalable in any quantity; and nearly the same thing would be true, if their investments were predominantly in securities. In fact, this is virtually always the state of affairs in every country at the very times when policyholders most need loans. Panics and wars not only produce the distress that requires the relief, but also lock up the means of giving that relief. By only one expedient that we can think of could a general release, in the form of policy loans, be made of the saved capital of life insurance companies. This is the financially unsound expedient of having the life insurance companies' investments, mortgages included, guaranteed by the government as the basis for bank-note issues. Even this method, however, would speedily bring evils perhaps worse than those it was intended to cure. The deterioration in the money value of bank-notes so issued could only result in making the last state of the smaller people in the community worse than their first.

None the less, here is a question which all "forward-looking" life insurance men will perceive to be destined to play a large part in the theory and practice of life insurance in the future. There can be no doubt that the generality of buyers of life insurance now wish to save, quits as much as to protect beneficiaries after their death, when they buy life insurance. The tremendous efflorescence of life insurance in recent years is explicable on this ground alone. How, then, can their savings be made quickly available to policyholders, in case the necessity arises for them to have these savings in hand? An answer to this question has not yet, so far as we know, been arrived at.

LIFE INSURANCE POLICY LOANS IN GERMANY IN WAR TIME

SOMEWHAT over a decade ago the life insurance companies of Germany began to feel that same inclination on the part of policyholders to borrow on their policies which has given rise to so much discussion recently in the United States. At first, the borrowing was on a very limited scale; but, as with us, it grew apace, though up to the outbreak of the present war in Europe it remained in volume far below what American companies have had to meet. In a recent article by Professor Dr. Alfred Manes, in the "Vossische Zeitung," the following facts are given as to the extent of borrowing on policies, as developed between 1902 and 1912:

"While at the end of 1902 policy loans for all the German life insurance companies amounted to only 190,000,000 marks [mark equals 23.8 cents], by 1906 these loans had reached an aggregate of 250,000,000 marks; by 1910, they were 343,000,000 marks, and at the end of 1912, according to the latest statistics, they had reached approximately 400,000,000 marks. In 1902, out of every 1,000 marks of assets of the stock life insurance companies 70 marks were policy loans, and 67 marks per 1,000 of the assets of the mutual companies consisted of such loans. The corresponding figures for 1912 were 74 marks for the stock companies and 75 marks for the mutual companies. In 1902, the occupational life insurance associations had only 2 marks out of every 1,000 marks of their assets in policy loans, while in 1912 the proportion had risen to 18 marks per 1,000 marks."

The tremendous economic and financial stress occasioned by the present war for the German population as for that of every country, whether engaged or not engaged in the titanic struggle, has suddenly brought the question of loans upon life insurance policies out from the former comparative obscurity of purely insurance circles, and made it a subject of public discussion in Germany, with many exchanges of pros and cons between the hard pressed life insurance company officials and publicists suddenly made aware of accessible financial resources to which heretofore they had given but scant attention. Great numbers of persons in Germany are already in a position in which the only ready money they can put their hands on consists of the loan values of their policies. The pressure upon the companies for loans has become tremendous, and the matter has been taken up by the Association of German Life Insurance Companies, whose conclusion, according to the latest reports, is that a rigid limitation of 500 marks each (or 1,000 marks at the outside) must be imposed upon all loans made upon policies, no matter what the size of the policy or the amount of the reserve accumulated against it. The attitude of the companies is well set forth in a circular issued early in September by one of the strongest and most respected companies in Germany. In this circular the company in question absolutely denies its *obligation* to make policy loans at all and asserts its own freedom of discretion in doing so, —and this despite the apparently adverse terms of Chapter 6 of the General Insurance Provisions of the German Imperial Code. The company outlines its own proposed course of action (consonant with the conclusions of the Association of German Life Insurance Companies), as follows:

"As a consequence of the war we are now in daily receipt of a steadily increasing number of requests for advances on policies; and, generally speaking, the highest possible amount is demanded. Often it is a question of sums of 50,000 marks, 60,000 marks or even more.

"Inasmuch as upon the aggregate of the policies which this company has outstanding, advances on policies to a total amount of over 200,000,000 marks are actuarily permissible, it is perfectly obvious that neither we nor any other life insurance company can meet all the requests for loans for the full amounts desired, unless we are to be deprived in the course of a few days of the sum total of our quick assets. Since, furthermore, we are wholly unable to foresee what contractual payments we may be called upon to make during the coming months, or how the premiums due us and the interest on our mortgages may come in, we shall until further notice grant policy loans to individual policyholders only to the maximum amount of 1,000 marks each. Moreover, in apportioning policy loans among applicants, we shall endeavor first of all to provide as far as possible for those of our policyholders who are insured for small amounts, since for such persons their life insurance policy is often the only piece of property upon which they can realize ready money."

This not unnatural and at first sight probably very necessary policy adopted by the German life insurance companies appears to have led to a good deal of recrimination among policyholders, who assert that when they bought their insurance it was with the understanding that they could always, in case of need, obtain loans upon their policies. At the same time the financial writers have taken the matter up, as one of vital concern to Germany, if she is to mobilize all her financial and economic resources, as well as her army, for the life and death struggle in which she is engaged. Some of the most brilliant and most widely known German writers on financial and economic matters are taking up the question of policy loans from this point of view. One of the most striking articles put forth by a publicist of this class is one by Herr Georg Bernhard, in a recent issue of his publication "Plutus." The title of the article is "Life Insurance as a War Help"; and the reputation of the writer should make interesting to American readers, particularly in life insurance circles, not only his views on policy loans as temporary aids to the population of a country in time of war, but also his conception of the economic place of life insurance policy loans at all times and under all conditions. Hence, in spite of its length, the article is here translated in full.

* * *

LIFE INSURANCE AS A WAR HELP

By Georg Bernhard

Translated from "Plutus"

It is reported that the Association of German life insurance companies has adopted a resolution, by the terms of which the German life companies are, as a preliminary step, to restrict the amount of the policy loan granted by them on a single policy to 500 marks. I have not myself read this resolution in published form, and only know that various companies in replying to applicants for policy loans have referred to it and have declined to lend upon their policies a higher sum than that mentioned. In my opinion this action is very regrettable, both in the interests of the community as a whole and also in that of the extension of the principle of life insurance. Hence I feel myself called upon to occupy myself with the question involved, and at some length.

The ninth paragraph of the Law of the Empire with regard to private insurance enterprises,—Law of May 12, 1901,—enumerates among the stipulations which must be included in the general insurance provisions of all insurance companies operating in Germany, "stipulations with regard to the presumptive rights given by policies and with regard to the contractual extent of the advance payments or of the loan values provided by the policies." All insurance companies undertake to make such policy loans; and they

are able to do this without any risk, inasmuch as no question of the granting of personal credit is involved in the making of a policy loan by a life insurance institution. These loans are, from an economic standpoint, however they may be legally interpreted, identical in character with payments in advance of claims which later will become due and payable in any case. For the benefit of those who are not closely familiar with the technique of life insurance, the following additional remark may well be made: However hazardous and speculative the life insurance business may appear to laymen to be, it is in reality pure applied science. Mathematics and statistics from the assured bases of its successful operation. The risk which a company assumes when it insures a human life is exactly calculable; and even though this calculation upon the life of a single individual should in many cases prove too favorable or too unfavorable for a life insurance company, the "Law of the Large Number" affords assurance of correctness for the great average of individuals. The premium which the taker-out of life insurance has to pay is for the most part simply the equivalent in money for the risk of the insurer. The risk upon a human life naturally increases with every year of the duration of the insurance; and the logical consequence of this fact would really be that every taker-out of insurance must pay higher and higher premiums as he advances in life. It is clear, however, that, were the premium rates continually changing and increasing, with the increasing age of the insured, the activities of the life insurance companies would be very materially hampered. Therefore, almost all the insurance companies have adopted the plan of charging equal, or "level," premiums for all of the years of the contract period. The result of this is that all persons carrying life insurance pay more in the earlier years than the actual risk to the company calls for; while, on the other hand, in the later years they pay materially less than the actual cost of the risk. The excess payments of the first years are accordingly put aside by the companies as so-called premium reserves, to the end that the greater risk of the later years may be covered by them. A well conducted life insurance company has the risk of all its outstanding insurance mathematically established every year, and from this calculation it determines what part of its annual premium receipts must be put aside as premium reserves. Originally, the setting up of the premium reserves was looked upon as simply an internal procedure of the individual companies, and hence was thought to have the result that the accumulated reserves became properly inner resources of the individual companies themselves. But in Germany legislation on the subject of life insurance has proceeded from the standpoint that the premium reserves are compulsorily set aside for the protection of the insured; that the accumulated premium reserves actually belong to the insured; and that these reserves must be applied by the companies in accordance with this principle. This conception of the legal right of the insured to the premium reserves has also found practical expression in that our legislature has interdicted the alienation from the insured of the premiums he has already paid in, should his payments cease after a specified number of yearly payments has regularly been made by him. Without regard to other procedures which are possible and which the life insurance company may put into effect, the company is bound, upon the expressed wish of the insured, to buy back, or redeem, the latter's policy for a sum that corresponds with a fixed percentage of the accumulated premium reserve against the policy. More than this far the greater part of German life insurance policyholders have a claim upon the insurance companies, which may be asserted at any time whatever according to their pleasure, for the full amount of this redemption value. It follows, then, that an insurance company runs no risk at all, if it promises to make loans upon the policy, which are smaller by a specified amount than is the redemption value of the policy; for when the company makes the loan, it simply makes an advance against a claim which the insured actually has against it.

The provisions and stipulations with regard to the making of policy loans are not the same for all the life insurance companies. In particular, they vary in that some of the companies include in their insurance contracts only the possibility of obtaining such loans, which others promise them out and out. This whole question of policy loans was given very little consideration in that stage of the development of life insurance when insurances payable in case of death were chiefly made and when the first thought of the taker-out of life insurance was to insure to those surviving him a sum of money in case of his dying and especially in case of his dying suddenly and prematurely. The business of insurance against death pure and simple, however, has at the present time been pushed far into the background, in favor of the insurance in case of the survival of the insured. As the years have passed, there has been an incessant increase in the multitude of persons who have entertained the hope that they might themselves come into the enjoyment of the amount of the insurance they have carried and paid for. For these persons the life insurance company has really been a savings bank, which to be sure had the disadvantage of being relatively poor in the matter of the interest accruing on the deposits, but which, on the other hand, had the advantage of guaranteeing to the savings depositor the sum which he hoped to save up during a long life, even should his ability to save be interrupted by his premature death. For many also the compulsion to save regularly which is inherent in the life insurance contract was found to produce a very wholesome effect, recognized by themselves. As this revolution in the life insurance business proceeded, the loaning facilities of the policy naturally gained greatly in importance. For it was only through this provision that there could be an escape from the disadvantage of life insurance saving, as compared with deposits in regular savings banks or other ways of putting capital by, that the savings were not, in principle, available in case the need for them should arise between times. So it was that in connection with the selling of life insurance the loan value of the policy was continually pushed more and more into the foreground; and inasmuch as, by way of recognition of the new situation, loans on policies were very liberally granted by the insurance companies, the public was brought to an even greater extent to look upon the taking out of life insurance policies as a substitute for savings deposits and for straight-out accumulation of capital in any form.

In view of the facts just mentioned, it was not surprising that immediately upon the beginning of the war the life insurance companies were almost swamped by people who sought to obtain loans upon their policies. In insurance circles, however, it would appear that far from sufficient thought had been given to this possibility. In this connection it is not without interest to learn that the article upon "Financial Preparation for War on the Part of Privately Conducted Insurance," written by a director of the well-known Gotha Life Insurance Company, Dr. Jur. R. Müller, and published in this very year, 1914, by the German Association for Insurance Science, set forth that: "Policy loans may, assuming that no positive obligation to make them is stipulated, be restricted in case of necessity." I, for my part, shall not insist upon the fact that this possibility does not exist for those companies which have legally obligated themselves to make loans upon their policies; these companies cannot arbitrarily cut down the amounts of policy loans without breaking the terms of their contracts of insurance. It is not my purpose, however, to get over upon the

ground of what is legal or not legal. A much more important point of view is that of social economy, the general welfare; and from this point of view the principle proclaimed by Dr. Müller appears to me to be exceedingly questionable. If, nevertheless, the Association of German Life Insurance Companies has sanctioned this attitude through its adoption of the resolution mentioned above, this fact proves to me only the more clearly that the leading men in this association are lacking in a correct understanding of what is economically necessary in case of war.

Since the very beginning of the war I have myself insistently urged the idea, both in "Plutus" and elsewhere, that we must stake everything to keep our economic condition from breaking down, in spite of the war. I have appealed to the banks, begging them that for the present they should not only not restrict extensions of credit, but that wherever possible they should enlarge them. I have directly and indirectly given persistent warning to the public and to business people that they should not hold up making payments, but that, in so far as it was humanly possible, they should go on meeting their obligations, even under the pressure of the war. But all this is possible only upon the condition that the opportunity be afforded to the smaller people and to the business world to take advantage of any and every source of assistance which can be conveniently and safely put at their disposal. What should we say, if our savings banks or, indeed, our banks of deposit were suddenly to announce that they will no longer pay over to the public the latter's money which they have in their possession? I am well aware, of course, that as a matter of law claims derived from the contract of insurance cannot be compared strictly and without reservations to claims on savings banks and deposit banks. But, economically speaking, it is all one and the same thing, inasmuch as a multitude of persons have paid life insurance premiums under conditions that compelled the neglect of other forms of saving, in the firm conviction that at any time the stipulated loan value of their policies would be absolutely subject to their demand. If now the insurance companies deny this right and refuse the loans, the only conclusion is that we find here a real economic peril to the community, seeing that with the assistance of these loans a great number of persons would be able to fulfil obligations which otherwise they cannot fulfil. Moreover, this situation implies a no less serious danger to the future of the life insurance companies themselves; for, from now on, people will no longer assume the load of insurance policies as readily as heretofore, or, to say the least, they will materially limit the amounts for which they insure their lives. Everybody will constantly have it in his mind that other means of saving afford better protection in case of a general political crisis.

The private business side of this problem must be solved by the insurance companies for themselves; but the community and the State are interested in the public economic aspects of it. For it is obviously in the interest of our general economic welfare that those who have saved in time of peace, should be able in time of war to make their savings readily available for use and, moreover, it is a matter of no consequence for what objects they get their money where they can use it. It is only fair to recognize the fact that the insurance companies in cases of particular necessity have shown themselves thoroughly sympathetic and accommodating. As I am informed, whenever business men have been exposed to the danger of failure or have been called to the colors, and have had to face in consequence a really pressing situation, the companies have granted them policy loans to the full amount permitted by their policy reserves. But this is not sufficient. To begin with, it is imperative that persons carrying life insurance should under all circumstances be spared the shame-producing feeling that they are begging for a favor, that they are obliged to lay bare in detail their entire financial and commercial condition to the managers or officers of the insurance companies. Even in those cases in which the companies are under no contractual obligation to make the loans, it is after all their own money that the insured are asking for. They are under the form of law borrowing money; but, as a matter of fact they are simply making available for their own use the money they have saved. It must not be forgotten that the character and form of the policy loan are such as to have the great advantage that the lender cannot off-hand demand repayment of the loan. The man who goes to his country's defense can in this case return from the field with the comforting assurance that he is not to meet upon his home-coming an almost unbearable burden of debt, which he will have the greatest difficulty in getting rid of; but that, on the contrary, he can gradually, as his resources permit, pay off the obligation without being oppressed by it. The same thing is true for the business man. If he to-day gets his bills extended, he is merely pushing his debts ahead into the future, and he runs the risk that at the end of the war he will find himself laden with an indebtedness which it is beyond his strength to take care of. If, however, he is in a position to get hold of his own money upon his insurance policy, he is in just as good a case as if he had taken fresh capital into his business. Consequently it will be found that such business men as have recourse to their life insurance savings, will be much sooner in a condition of preparedness to fulfil their obligations. And this is quite apart from the consideration that at the present moment the possibility for the merchant to pay cash for what he buys, may mean an unusual profit to him. Therefore, the insurance companies are taking a wholly false standpoint when they base their willingness to make advances on policies upon the demonstrated necessities of the applicant. The community is deeply concerned that the companies should provide the business world and private individuals with amounts of capital commensurate with what they require.

Now, there is no question at all that in one respect the life insurance companies are in a worse position than the savings and deposit banks. Leaving out of account the timorous people who withdraw their money all at once from these banks, in order to keep it by them at home in cash through fear of a panic, the public in general withdraws its savings and deposit money only to the degree required for the needs that present themselves. In contrast with this, policy loans are, under existing conditions, withdrawn in their totality from the insurance companies and transferred to the ordinary bank accounts of the borrowers. Consequently, the demands made upon the insurance companies all at one time are greater than the similar calls upon the banks. The companies, however, are able to protect themselves easily from this evil; they should all, for the duration of the war, open banking departments. Then every policyholder who applies for a loan on his policy would have an account opened in his name in the banking department of his company, and whatever amount he might desire to borrow would be credited to him in this account. He would then be in a position to draw out the necessary amount as he finds use for it from time to time, or, if he preferred, to have it transferred to any other bank. Through this expedient, in the first place the demand for money directed all at once against the insurance companies would be greatly diminished. Furthermore, the companies would probably have the experience throughout that on the average the full amounts of the loans made would not actually be used by those having these accounts with their banking departments. It may even be expected that the borrowers, particularly the business men, would pay back considerable sums in the course of the war, so that upon the closing up of the accounts at the end of the war it

would in a great number of cases be found that but slight portions of the loans made had been actually taken from the companies. It is, of course, understood that the insurance companies, in their insurance departments, would charge the regular rate of interest upon the amounts loaned and that the insured would pay this. On the other hand, the companies in their banking departments would have to pay the same rate of interest upon balances left with them, that banks generally pay upon their deposits. In order to prevent the unnecessary handling of money backward and forward between the insurance companies and the banks, the expedient might commend itself that for the amount of their balances in the banking department the insured should be given check-books containing checks made out in amounts of 50 marks and 100 marks, and agreeing in total amount with the amount placed to the credit of the insured from their policy loans. These checks would certainly be accepted by the banks in payment of sums due them. If they were drawn upon insurance companies of recognized standing they could certainly also be used in payment of rents, in payment of interest on mortgages and in payment of business debts. Even if it should be true that for the moment certain legal or administrative obstacles stand in the way of such banking business carried on by insurance companies, these obstacles ought to be removed at once, for the community has the very greatest interest that the life insurance companies, of all our financial institutions, should not at a time like the present refuse their support. On the other side, it goes without saying that the insurance companies have a right to such protection of their interests that their situation is made as easy for them as possible.

It is an unfortunate fact that in peace times far too little attention was paid to the life insurance companies as an important factor in our financial mobilization. In the days of peace to come there will be all the more reason why this should be looked to. It will be particularly necessary to inquire whether the financial arrangements and equipment of our insurance companies for meeting exigencies like the present are not too weak in the direction above pointed out, inasmuch as altogether too much regard has been had to the mere safety of the companies' assets and not enough to the ability of the companies to make these assets quickly available, if necessity arises. It ought to be a cause for serious reflection that, in the year 1912, forty-three German life insurance companies had invested in mortgages no less than about 4,800,000,000 marks, out of their total resources of some 5,709,000,000 marks. Hence the requirement of a much increased investment in German Imperial and State loan issues appears to be the proper *mot d'ordre* of our life insurance companies in the years immediately ahead of us, to the end of increasing their ability to get their assets quickly into liquid form, if it becomes necessary for them so to do.

SHORTENING THE PERIOD OF CONVALESCENCE IN PERSONAL ACCIDENT AND WORKMEN'S COMPENSATION INJURY CASES

By Carl Fallén, M. D.
Late Medical Director of Zander Institute, New York, N. Y.

IT is most significant of our times that this meeting of laymen should take place at a health resort where the most modern forms of therapeutics have been installed and almost simultaneous with two important meetings for advanced therapeutics; one, the Meeting of the American Electro Therapeutic Association at Battle Creek, Mich., last week; and one, the Society for Spondylotherapy in Chicago, this week. The most elaborate, as well as the most important method that we find represented here at White Sulphur Springs, is the so-called "Zander System." Having been the manager, as well as the medical director for a Zander institute for sixteen years, and being familiar with its merits as well as its short-comings, I propose to lay before you in the simplest form its underlying theories, and I will assume my natural tendency of a teacher and show you the simplicity of it all and then suggest that you may shorten the period of convalescence by half without the expense of the Zander apparatus or extra medical service.

A favorite expression of Bismarck, the father of workmen's compensation, was, "Everything is an economical question," and his compensation law was certainly not established as philanthropy. We might now say these laws are largely a medical question, for if a casualty company could employ a man capable of removing all effects of injuries by a magic wand, that company would soon get all the business by its competition in rates; but the constantly increasing expense of medical service in Europe has raised many vexed questions there. Ever since 1884, when the workmen's compensation law was enacted in Germany, the influence of the physician in regard to these laws has been eminent and constantly increasing; in fact, at an international meeting of insurance men that took place at The Hague recently, three-fourths of the time was given to the so-called "doctors' question." Consider the treatment of hundreds and thousands, and, for the whole country, millions of cases, and you can readily see the value of saving one day in the time of recuperation of each case. Take the instance of a sprain, which I maintain should not require over three days' treatment, during which entire time the patient should be encouraged to use the injured part. Compare this with the records which show that an average time required for restoration of sprains is twenty-seven days, and you will realize what a saving could be accomplished if my statement be correct.

Numerous cases are discharged from the hospitals as cured and, while restoration of strength necessary to attend to their work may be delayed indefinitely with these so-called cured cases, no further treatment is accorded them; but the insurance company, or the employer, or the State Compensation Fund has to pay out 66 per cent of the regular wages of such employes. If these cases were properly cared for, statistics show that this time of convalescence could be shortened by 40 per cent to 60 per cent.

The promulgation of the act for insurance against accidents in Germany in 1884 has affected more than two hundred trade associations which direct nearly fourteen millions of workmen, or about one-fourth of the population of the German Empire. Hospitals had to limit their treatment of such cases to a minimum. The lack of control of the after-treatment soon made special Convalescent Homes necessary, where the after effects could be overcome in the speediest way possible. In these institutions, massage and Swedish movements, with or without mechanical apparatus, constitute the principal treatment. The first so-called "Health Home" was established at Nieder-Schoenhausen, near Berlin, by Dr. G. Schütz, the medical director of the Berlin Zander Institute, and at the expense of the trade unions. It was here these good results in reducing the convalescence period, as above stated, were obtained. Since then a great number of such institutions have been established, and some of them at very great expense, one of them costing 4,000,000 marks. Germany now has over one hundred Zander institutes; and when you figure that a complete outfit of apparatus alone costs about $20,000, you realize what large investments have been made there representing only the mechanical side of modern treatment. Quoting Dr. Schütz briefly, I will now give you an idea

A paper read at the Fourth Annual Convention of International Association of Casualty and Surety Underwriters, September 23, 1914.

of the system and some of the reasons for its success as an after-treatment of accident cases:

"The first and most important group of the Zander system contains the apparatus for active resistive movements. For each arm, leg and trunk movement there is constructed one apparatus (in all, forty) which by means of its adjustment adapted to the anatomical conditions allows of the active exercise of a certain group of muscles. The resistance to be overcome is accurately known and can be increased or diminished as occasion requires. Zander has ingeniously attained the measuring of the resistance by the application of the weighted lever with a gradation along which the resistance weight is moved. While therefore each apparatus at the same time represents a balance on which the amount of muscular action offered can be determined, it further makes possible the adjustment of resistance to the varying development of strength during the different phases of the contraction of the muscles.

"By the careful fulfilment of the main anatomical and physiological conditions in the construction of his resistive apparatus, Zander has succeeded in causing muscular exercises to be made in the most perfect manner. The movement is so unusually beneficial and strengthening in its effect, because it cannot but be given correctly by the apparatus, and because it meets with suitable resistance for each successive phase.

"Thus there is a sure guarantee for the gradual increase of strength of enfeebled muscles, as, from the very beginning, that which effects this increase,—the course of exercises,—is adapted to the exact strength of single muscles and is increased but gradually and in proportion to their increase of strength. Over-exertion with consequent decrease of strength is out of the question with proper use of the apparatus under mechanical control.

"The second group in the Zander *arsenal* for us to take into consideration consists of a small number of apparatus for passive movements, for instance, passive hand-flexion and extension of separate finger joints, passive chest dilation, etc., etc. The apparatus is set in motion by some mechanical motor, while the patient, without making resistance, allows the movement to be given him. Here again it is chiefly a question of making the joints flexible and of the tension of shortened muscles and tendons. By the uniform movement of the apparatus which cannot suddenly increase the appointed and adjusted range of movement, the patient experiences a feeling of security that the limit of painlessness, or of endurable pain will not be exceeded. He does not strain his muscles, and the absence of this half voluntary, half automatic or reflex innervation of muscles secures a more lengthened exercise for the mobility of joints than by manual passive movements during which the patient is not one moment secure against the well-meant but sudden and painful increase in the range of movement. This impersonality in the treatment with the apparatus is, therefore, of the greatest importance. Add to this that the patient is not,—passively, or completely, fettered by straps as in other apparatus,—left to the mechanical power of the motor; he can at any moment stop the movement, let go the handle and rest.

"The third group of Zander apparatus serves to effect certain mechanical operations, such vibrations, percussions, frictions, kneadings, of different and easily accessible parts of the body. Here the question is of a single massage manipulation, but only of regions where the mechanical apparatus can replace the action of the hand. It is necessary to emphasize this particularly, as 'mechanical massage' is frequently spoken of, and the subject represented as though in medico-mechanical institutes massage were exclusively given by means of mechanical aparatus. How unauthorized such a supposition is, appears from the words of Dr. Zander:

"'Even where mechanical gymnastics are practiced on a large scale and with the most complete apparatus, the hand must be called in to assist in the treatment of the disease of the locomotive organs, for accomplishing the now so generally used manipulations known by the name of "massage." However desirable it may be that this treatment, so fatiguing to the massage-giver and so expensive to the patient, could be effected by machines, there exists insurmountable obstacles for their use. The masseur must always be able to judge, by his own touch, of the anatomical and pathological nature of the tissues treated, in order to vary, as the case requires, both the direction and the nature and strength of the manipulation.'

"The disease, as represented, for instance, at the Convalescent Home for Injured, at Nieder-Schonhausen,—which, usually, is not in a position to begin the after-treatment until the tenth month following the injury, and consequently at a relatively late period—consist of the following seven groups:

1.	Fractures	49%
2.	Lesions of soft parts	19%
3.	Contusions	18%
4.	Dislocations	5%
5.	Suppuration of cellular tissues, inflammation of tendinous Sheaths	3.5%
6.	Sprains	3%
7.	Various other injuries	2.5%

"These percentages are taken from a list of 1,416 injuries treated during the last three years.

"Fractures, which according to this, form one-half of the injuries coming under treatment, result in exactly the same functional derangement as lesions of soft parts, contusions, dislocations and other injuries, and, therefore,—so far as the question is one of possible pathological improvement—offer the same therapeutical mission to the mechanical after-treatment. In the first place, we have to consider derangements in the action of muscles and joints, either as direct consequences of the lesion or as indirect consequences of the accident (caused by inactivity, tight bandages, etc.), and therefore pathological changes in muscles and articulations offer the most usual point of attack for mechanical therapeutics, and form the domain where these, according to the opinion of experts, reign supremely. In muscles there are, ordinarily, states of atony and atrophy (diminution of muscular tone or power, and wasting of muscular substance) as well as changes in the mechanical and circulatory condition of the muscles (contractions, lessened elasticity, stagnations and infiltrations).

"In the articulations, there occur agglutinations, deformities in the cartilaginous covering, infiltrations and shrinkings of the capsules and ligaments, as well as thickening of the synovia; far less frequently in increase of the said fluid and over-tension and relaxation of capsules and ligaments. The resulting functional derangements most generally consist in a limitation of the mobility of the joints (contractures), more seldom in undue mobility of the latter.

"By the side of these pathological changes in muscles and joints, changes in the tendinous sheaths (deformities as remains of past processes of inflammation), infiltrations and extravasations in the cellular tissues, and finally cicatrisations of the skin come relatively seldom under mechanical treatment.

"Besides the accomplishment of these special tasks, the important question is raised of improving the general state of strength and nutrition, especially when a lengthy confinement to the sickbed, severe blood-poisoning (pyaemia) or a wasting nervous illness have followed upon the injury."

Now as to the principles underlying this treatment, t is not generally understood, even in Germany, that Dr. Zander, of Stockholm, Sweden, great though he is as a physician and a mechani-

cal genius, is not the originator of any new principles in the treatment of human ailments for the principles are the old ones of treating diseases with motion, plainly the so-called "Swedish movements" and massage, used from time immemorial and traced back to Chinese, Hindu and Egyptian practice and recommended by the most famous physicians of Greece and Rome and in the medieval times by the Arabs whose domination in medicine lasted for centuries, chiefly following the principles of Galenus, the most prominent physician of the Roman Empire who gave this treatment much attention. But the medieval times had no use for rational treatment or simple experience. It was a time of speculation and mysticism and medicine has suffered longer than any other science from these dark ages when its representatives turned exclusively to the pharmacology and the monks found prayers and conjuration more convenient treatment than massage and exercise.

In the cases that result from accidents the primary efforts (except for surgical treatment) must be for the relief of inflammation in one form or another.

As for the consequences of prolonged inflammation with stasis and hardening of the soft tissues the drying up of synovial membranes, stiffening of joints, and adhesions, etc., these Zander machines are excellent as far as they go, but their adjustment and regulation of movements are not complete, and while this series contains various modalities for vibration they are, as a rule, not suitable for a practical breaking up of either adhesions, or clearing of articular surfaces which certainly should be the most important use for them.

This fact is quite natural when we know that Dr. Zander never intended these apparatus to be a complete substitute for either massage or Swedish movement.

Dr. Zander conceived the idea of this invention (afterwards so famous) at the time of his medical studies when he gave instruction in gymnastics at his sisters' boarding school for young ladies. He found the girls either too weak, or (possibly) too lazy, to perform the ordinary gymnastics; besides many of them needed medical gymnastics for asymmetry, deformities, or other ailments. From this simple beginning he gradually developed his complete rational medical therapeutic apparatus soon after he had graduated in medicine, which is now about fifty years ago and he is still managing the Zander Institute in Stockholm.

His first intention was to give the most rational kind of gymnastics for general constitutional effects. But they were to be used only subsequent to, and in conjunction with, manual massage and movements. In Germany there has been a tendency to promote the Zander system as an entirely new science, complete in itself and through its naturally expensive outfit and through local monopoly by means of contract, etc., exclude competition in the massage treatment which I claim every adult member of the poorest as well as the richest family should know how to give.

I heartily endorse everything that has been said here about educating the public in preventive medicine. This endeavor is now universal. But why shall we stop there? Why not deal with facts? Why not educate the public in the treatment of existing ailments, such as the effects of injuries. At least the people who assume the financial responsibility for restoration of health after accidents and in diseases should know the most economical as well as the most efficient ways of doing so.

My desire is to call your attention to a fact which seems not to have been fully recognized in Germany or anywhere else and that is the necessity of applying the principles which underlie the Zander treatment to the very earliest handling of every accident case.

All economists as well as physicians agree that the fundamental rule should be to secure the earliest possible examination and treatment of every accident case. In the admirable compilation of reports called "Accident Prevention and Relief," made by Schwedtman and Emery for the National Association of Manufacturers of United States of America, we read how the Baden Building Industry Employers' Association established that the expenditure of $8,000 in prompt and expert medical attention to injured workmen saved approximately $160,000 in compensation expenses; and that a Vienna insurance institution figured the net savings due to the establishment of a first aid medical station to be $27,000 in nine months. I cannot make my ideas clearer to you than by telling you how to apply the simplest and yet the most rational treatment of minor accidents, among which I count contusions and sprains.

Contusions.

If you knock your elbow against a doorway when too much in a hurry, you experience pain in the part which "knocked the wood" and you proceed at once to "rub" that spot in order to relieve the pain. Temporarily you obtain relief, but soon it returns and you send for a doctor who tells you it is a case of "contusion" which must be treated scientifically, as "ecchymosis" probably has occurred which may be followed by "suppuration," "anchylosis," or "necrosis." You are thoroughly frightened for the doctor certainly has told the truth; but the truth was told in such "big words" that the "contusion" has added confusion to your distress and you are willing to undergo a long process of "evaporating lotion," "compressions," "puncturing," and perhaps, "aspiration." You never realize that your good doctor in treating your case thus may be disingenuous in not telling you that you could handle your case much quicker and with very much less trouble and expense yourself. Or you may send for a masseur or "osteopath" who will proceed with a number of manipulations and gentle movements to relieve your pain and gradually reduce the swelling that may have developed. You like him and ask him to come again. He may tell you not to attempt to do any "rubbing" yourself, or to let any one in your family or in your service to do so. In this advice he may be equally disingenuous, if you are ignorant about the condition of that elbow of yours. Now wouldn't you like to know a little about this? "Contusion" is simply the medical term for a bruise, "ecchymosis" means just the oozing of blood into the injured part, and pain is caused by pressure on the numerous nerves in the blood crowded ("hyperaemic") region of any injury, small or extensive. In no case of this kind would your rubbing or anybody else's stroking and rubbing do any harm as long as you see to it that your pain is not increased by such manipulations. Gentle stroking is a great sedative always and, if done from the centre of the injured part towards its periphery, removes the superfluous blood to the adjoining regions where it will be absorbed. This is precisely what the doctor tries to do with his lotions. He may relieve the pain by causing the blood vessels to contract, thus reducing the blood supply, but this is done at the expense of a free circulation which is most essential for the removal and absorption of the hyperaemia which takes place at the very moment of the injury. By your manipulations you not only relieve the congestion mechanically, but you stimulate the small nerves in the walls of the blood vessels (the vaso-motor nerves) which cause an alternate contraction and relaxation and thus you help nature to restore the equilibrium of demand and supply of health restoring arterial blood as well as of removal of useless or deleterious matter in the venous blood.

Anchylosis (stiff joint) may result from just such irrational treatment as "immobilization," tight bandaging, or plaster of Paris encasing which is still resorted to. While it certainly reduces the swelling, it diminishes circulation in the injured part, thus pre-

venting the normal cleansing by the venous return and the antiseptic as well as the nutritive action of the arterial influx. Stasis is produced and infiltration promoted and, even if mobility is not permanently impaired, the normal function of a joint will certainly be delayed. Then a different kind of "rubbing" must be resorted to. Adhesions of soft tissues to bones or to each other must be broken up by vigorous kneading and passive movements (done by an operator). This process is painful as new counter irritations and inflammations must be set up in order to bring a fresh blood supply to the part which has hardened by infiltration and by closing up of its blood vessels. Each new inflammation thus produced will be almost a repetition of the first one produced by the original injury. What would have been accomplished in a few days by a common sense treatment may now take weeks and months.

Sprains.

Such an accident as spraining an ankle is usually looked upon as a serious affair, requiring immediate attention by a physician and weeks of idleness for the patient.

If people only knew the true condition of a sprain and the modern rational treatment of such cases, any member of the family could attend to it and the patient would never need to go to bed a single day. He would always be in normal condition in about three days.

A sprain should never be treated with bandages or plaster of Paris. The condition of most sprains is simply this: No bones are broken or out of joint; simply, the ligaments are stretched, or perhaps torn from the bones. Blood is rushed to the part, causing swelling and pain by pressure on the nerves. Some blood vessels may have been ruptured and blood oozed out from them, causing stagnation of the circulation. This is the reason why rest or "immobilization" should not be allowed. For prolonged stagnation of the blood causes stiffness of the joint. On the contrary, the blood vessels and the lymphatics should be kept open by application of water as hot as the patient can bear. Gentle stroking upward should be given with the palm of the hand above the swelling. Thus the blood in the local veins is pushed up in the larger veins giving room for the blood in the swollen part to be absorbed. By this method you can see at once how the swelling is reduced. The patient may think that the swollen part is too sore to be touched. But you may easily convince him that by simply touching the reddened skin you produce a cooling sensation and you can immediately proceed with the gentlest kind of stroking upward, even over the swelling. Then go over the parts above again with a little deeper stroking before going back to give gentle stroking to the tender swollen part. All stroking should be done in a direction toward the heart. If the stroking is done with sufficient care it may be kept up for an hour at a time. If the pain will allow any movement of the joint, do not delay trying it, as each movement causes an alternating opening and closing of the blood vessels, thus performing an act of pumping out the blood from the swelling, the retarding of which causes all the redness, swelling, heat and pain.

In daytime external heat for keeping open the small blood vessels (capillaries) is best kept up by water as hot as the patient can stand. Do not let it cool, but pour on more and more, if possible, with the foot under the faucet in a bath tub. At night, you let the affected part heat the water under a loose bandage and prevent cooling by supplying a water tight bandage. This is done in the following manner: "Wet an ordinary towel in water of the room temperature and wring it moderately dry. Wrap it around the swollen part. Outside this towel, wrap a piece of oil silk, sold in drug stores for about 25 cents a square foot. Use only one layer with ends overlapping each other a few inches. Also see that it is wider than the towel bandage, coming in contact with the skin for an inch or two above and below. Outside this oil silk wrap loosely another towel, or piece of flannel, to insure the keeping of the heat within the swollen part. This is not a bandage in the ordinary sense of compressing the part, but to prevent lowering the high temperature produced by the inflow of blood to the injured part. If properly applied, such a bandage should keep up an ever increasing heat and thus keep the capillaries open to allow a normal circulation to be restored and rapidly relieve the pain caused by pressure on the nerves. In the morning, you should find the whole ankle soft and steaming hot. Now continue the manipulations and gentle movements of the day before, increasing both as fast as the painfulness will permit; any member of the family, or servants, can readily alternate, rendering this service to the patient all day long, thus hastening the natural process of recovery. Encourage the patient to use the foot as soon as possible, gradually learning to stand the pain as much as possible. The normal functions of the part produce the speediest restoration to a normal condition. The "immobilization" of the part with rest and tight bandages will only delay recovery and cause stiffness and permanent enlargement of the joint.

Now I see no reason why any such cases should be sent to hospitals or even be granted but general supervision by the practicing physicians as neither could or would devote themselves to this simple, tedious and laborious work. I maintain that masseurs and masseuses (always restricting the cases to manipulators of the same sex) can easily be trained among the employes themselves and it will not be at all necessary that they should remain a special cast but be retained as workers in their individual capacity except for helping their injured co-workers. I go so far as to say that it would pay all employers to have every employe know the principles of massage. This would not promote quackery, as such treatment should be given only at the discretion of the physicians and under their general supervision. Thus, the prevention of numerous ailments and the quickest recovery from many of them as well as the best treatment immediately after all accidents would certainly be resorted to automatically and the effect on the number of "reported" accidents and, last but not least, the reduction in medico-surgical expense would be most startling.

The Zander method in Germany is used chiefly as a convalescent treatment usually months after an injury and the principle of treating all injuries as much as possible without bandaging or other restrictions of the circulation from the very beginning has not yet been sufficiently observed there. Otherwise there certainly would not have been the need of such tremendous efforts to overcome the evil effects of prolonged convalescence. These effects exist everywhere though we observe them less in private practice or in the ordinary hospital work when the individual must take care of himself. The world has ignored the unnecessarily prolonged suffering and sorely needed these compensation laws to realize the tremendous financial losses in order to wake up and see what should have been done and must be done in the future to prevent them as far as possible. But Zander's as well as all other mechanical apparatus are almost useless in the treatment of any injuries in the acute stage and were not devised for such service. In these conditions the human hand cannot be replaced by any machinery. And the best nurse cannot relieve the damming up of the circulation with her medicine bottle, nor with her bandages, nor with her kind words. She must proceed at once with the best machine yet constructed, the human hand, as physical means to remove the physical obstruction which is the first result of every physical injury. Now this may be used as an argument against

my plan, I mean that an excuse may be given that this work should be done by the nurses. I will answer such remarks in advance by saying: Don't be foolish or unreasonable. Their training is different and their work is certainly hard enough without this specialty which should not be expected of them. Massage, honestly given, is about as hard work as anybody can undertake for a living. I have seen the strongest mechanics and the hardiest nurses give up their regular occupation and become financially successful masseurs and masseuses, but, in a few years, succumb completely under the strain of their work. This will not be the case when every employe knows how to do this simple but arduous work so there will be no lack of relays when needed.

Now we may preach hygiene in every form and have many listeners and few followers, but when diseases come or accidents with their painful sequences occur we can show the people what to do for themselves, we need not preach any further and the value of hygiene will be realized later and if any of you are interested in this educational propaganda not only from a philanthropic point of view, but also from its economical side, the world will join us when we raise our banner with the motto: *Layman, Heal Thyself.*

NOTES ON INSURANCE, AMERICAN AND FOREIGN

Bomb Insurance in London.—The swift advance of the German forces, during the last few days, through Antwerp toward Ostend and the coast which lies little more than twenty-five miles across the English Channel from England itself, has caused considerable fear in London of German airship raids with the accompanying danger from bombs. This fear has lead many to seek safety in so-called "bomb insurance," which is being issued principally through Lloyds.

A cable to the New York "Times," under date of October 14, states: "There was such a rush to-day for insurance against bombs that the rates at Lloyds' took a decided upward turn, being the highest for risks near the houses of Parliament, Buckingham Palace, the Mansion House, the Bank of England, Saint Paul's Cathedral and the railroad stations."

In these neighborhoods the rates charged are naturally higher than in others because certain buildings are sure to be the objective points of any German attack, should such an attack transpire. In such places rates are quoted from five shillings per cent to seven shillings and sixpence, and even ten shillings per cent in some localities (this would be, roughly, $1.25, $1.87 and $2.50 per $500 of property insured). The rate up to this time has been two shillings and sixpence per cent (62.5 cents per $500).

The so-called airship clause of the policies reads as follows:

"This policy is to cover risk of loss of and (or) damage to the property hereby insured directly caused by aerial craft, hostile or otherwise, including bombs and (or) missiles dropped or thrown therefrom, including risk of fire and (or) explosions directly caused thereby."

An official of one of the large English insurance companies is quoted as saying:

"Several large insurance companies have decided to write no policies against damage by bombs. They took such a step after considerable deliberation. They are of the opinion in the event of a real invasion by the Germans there would be a great chance that it would be impossible to pay claims."

Another question considered by the principal companies was the possibility of heavy loss on such policies, in view of which they were unwilling to make other policyholders share such responsibility.

However, one of the properties so insured is the office of the American Society, and a firm in Oxford Street, London, is said to have a policy for $750,000 on its premises and contents, for which it pays a rate of five shillings per cent ($1.25 per $500).

* * *

Fatalities in Metal Mines in the United States During 1913.—According to a paper just issued by Mr. Albert H. Fay, of the United States Bureau of Mines, the number of men employed in the metal mines was, in 1913, 193,088, as compared with 169,199 in 1912. The number of fatalities in these mines was 683 in 1913, as against 661 in 1912. The number of men employed and the number of men killed in and about the metal mines in the United States during 1911, 1912, and 1913 is shown in the following table:

	Number Employed.	Number Killed— Total.	Number Killed— Per 1,000 Employed.
1911	165,979	695	4.19
1912	169,199	661	3.91
1913	193,088	683	3.54
Average for three years	176,089	680	3.86

"While the total number of persons killed in the metal mines during 1913 was slightly more than in 1912," says Mr. Fay, "there were about 24,000 more men employed, so that the rate is reduced to 3.54 per 1,000 employed during 1913, as compared with 3.91 for 1912.

"The important mining States showing a continuous reduction of fatality rates during 1911, 1912, and 1913 are Idaho, Michigan, Montana, Nevada, New Jersey, South Dakota, and Utah, representing, in 1913, 38 per cent of the mining industry. Of the States showing a decreased fatality rate during 1913 as compared with 1912 only, may be mentioned Alaska, Alabama, Colorado, New York, Oklahoma, Tennessee, Wisconsin, and Wyoming.

"This gradual reduction is to be accounted for largely by the introduction of safety appliances, better supervision, and a more strict enforcement of rules and regulations of the mining companies, and a closer observance of the State laws. Practically all of the larger companies, and many of the smaller ones, have done much in safeguarding their employes. They have inaugurated the 'safety first' movement, with the results above mentioned. By first-aid treatment many slight injuries have been cared for, pain relieved, and a cure effected in a short time, so that many of these injuries have been of short duration and kept out of the 'serious injury' or 'fatality' class."

* * *

Workmen's Compensation in British South Africa.—In a recent "Newsletter" of the Southern Life Association, an insurance company of Johannesburg, South Africa, appears the following interesting comment on the new workmen's compensation law of British South Africa:

"The above Act was passed during the last session of Parliament, and will apply to the four Provinces of the Union. It will certainly be a great advantage to everyone concerned that one Act should apply to the whole Union, and it will undoubtedly simplify matters, in so far that the employer of labor will now know exactly what his liability is, should he obtain contracts in any Province, or have employes traveling from one Province to another. It will also probably lead to a uniform rating in respect of this branch of insurance. The new Act is certainly an improvement on the Cape and Transvaal Acts at present in force, and will do away with several debatable problems that exist under those Acts. We are given to understand that the Act will come into operation on the first of January, 1915."

* * *

Tax on Foreign Fire Companies in Argentina.—It is evident from a paragraph in an English periodical that Argentina is a

believer in home industry. It is proposed by the Argentine Finance Minister to increase the tax levied on premiums taken in by foreign fire insurance companies in that country to 15 per cent, as against 2 per cent for local companies. The present taxation is 7 per cent for foreign companies (of which there are about twenty working in Argentina, all except three being British), and 1 per cent for local companies.

INSURANCE NEWS IN THE WEST

The American Life Convention and Federal Supervision.—The declaration of opposition to Federal supervision is regarded as the most important action taken by the American Life Convention in annual meeting at Dallas, Texas, last week. The companies composing this organization are mostly Western and Southern institutions. At home many of them cut considerable of a figure and their interests are regarded as important. They recognize that in size and influence they do not compare to the great institutions of the East. So long as their own State legislatures enact the laws for their government, they are fairly sure of receiving friendly consideration. If Congress were legislating for all of them, there is no certainty that it would be friendly.

Notwithstanding the increasing cordiality between the American Life Convention and other organizations, its members are not in all cases certain that they would not suffer if it were within the power of the large companies of the East to make them do so. Thus, some of the members fear that if Congress were legislating on life insurance for the whole country, it would do away with the preliminary term system of valuation and do it on recommendation of the Eastern companies, which put up full reserves from the start. This would be a body blow to the younger companies, and they prefer State supervision with all its drawbacks to a system that might put them at the mercy of their strongest and largest competitors.

Another consideration that weighed for something in deciding the convention's attitude on Federal supervision was the fact that it is very doubtful if it could be brought about without a constitutional amendment and, if such an amendment were offered to the States, it likely would be several years before enough of them would adopt it to make it effective. During all that time insurance legislation would be more strongly called to public attention and companies would have to be constantly vigilant to try to head off legislation of an undesired character.

* * *

More Trouble in Chicago Agency Problem.—Now comes the executive committee of the Class Two Agents' Association of Chicago, and after a recitation of the causes which in its opinion have created the bad conditions now existing in Cook County, intimates that unless conditions are corrected it will seek legislation to deprive the Chicago Board of the control of the business which it now enjoys. These Class 2 agents, who are largely real estate and renting agents, small outlying banks and the like, want the same rates of commission as are paid the downtown agents. They want full voting membership in the board and various other privileges they are not likely to get. These agents control a large amount of preferred business in Cook County. This business is profitable because it is rated out of all proportion to similar risks in other parts of the State. Accordingly, certain companies which have large Class 2 agency plants and are making money out of them, have always been accustomed to look after the interest of this class in any legislation undertaken by organizations of companies. Otherwise they probably would not be faring as well as they do, for many of them are mere "interceptors" of business that otherwise would go to a broker or a Class 1 agent who is giving real attention to the fire insurance business and endeavoring to give service.

* * *

Western Coal Mine Operators and Compensation.—The recent declaration of Industrial Commissioner Warren Garst, of Iowa, that the workmen's compensation act of the State needs amending so as to provide for insurance exclusively through a State fund, has brought out an interesting letter from a prominent Western casualty man. Mr. Garst had pointed to the coal operators as a class that are nearly all staying out from under compensation and he attributed this action to the stock company rates, which he holds are about seven times too high on coal mines.

The casualty man who comments on Mr. Garst's declaration says that nearly all the coal mine operators of Iowa and of several other neighboring States are insured through an interinsurance concern. He says that it is the established policy of this institution to advise its subscribers in compensation States not to go under the compensation laws. The theory on which this practice is based is that the liability of coal operators could be carried for a very reasonable figure if it were not for the great catastrophe hazard. If the operator elect to pay compensation, the laws of most States require that he take insurance covering the entire liability. Including the catastrophe hazard, no company or concern can carry coal mine liability at a low figure. In order to limit the liability of the insurer and make a low rate possible, sbuscribers are advised to remain under common law and statutory liability. In the vast majority of cases the limited liability insurance will be sufficient. Where a mine suffers from a catastrophe, it appears that it is considered preferable to let the operator be ruined and go through bankruptcy and leave the victims and their families without recourse, rather than tax all operators enough to pay the insurer for carrying the whole liability.

If it be a fact that it is, or is to be a settled policy among coal operators in States having elective compensation laws to elect to remain outside and fail to provide for the explosion hazard, it is difficult to see any other outcome than increased efforts by constitutional amendment or otherwise, to make the compensation laws compulsory.

* * *

Merger Difficulties in the West.—Within the past few months considerable attention has been given by a number of men connected with Western casualty and surety companies or promotions to bringing about mergers. In several cases this has proved so difficult that it had to be given up although those in charge were desirous of amalgamating them. The laws of the States offer many difficulties. A company doing business in its home State in some cases cannot enter a neighboring one to reinsure a company of that State. Promotions that have been partially carried through cannot find a legal way of adding themselves to going concerns. Another difficulty is to agree upon terms of merger, even where both sides desire it. Sometimes the relative values of plant and good will cannot be agreed upon. Often no merger can be effected unless a certain number of officers of both companies are well taken care of, and to do this would break the back of the merged company in paying salaries.

Of late, at least two securities companies have been organized chiefly for the purpose of facilitating mergers. Their promoters maintain that by exchanging stock of insurance companies for stock of securities companies several companies can be brought under one management, viz.: that of the securities company, and the owner can in time merge them on such plans as it sees fit. David W. Armstrong, former secretary of the National Surety Company and now president of the National Fidelity and Casualty Company

of Omaha, is president of the Underwriters Securities Company, one of these institutions. Associated with him as officers or directors are officials of several other Western companies or mutual associations. This furnishes ground for belief that the merger of these concerns with others is contemplated, although this does not necessarily follow.

The West has a large number of casualty and surety companies that control considerable business, but either have not capital enough to enter adjoining States or are not heavy enough to carry on the lines of business they would like to do. South Dakota has several surety companies with small capital, but considerable business. In Nebraska are several accident and health companies doing a fine business, but without capital enough to permit their expansion. Wisconsin also has one or two accident companies of this class. There are other larger Western companies chartered to do a multiple line business that have looked with longing eyes towards Illinois and the large business of Chicago, but cannot possibly get into the State with their present capital and broad charters. Possibly through the medium of the securities companies a number of these will be amalgamated into one or two large companies which can enter any of the States.

Chicago, October 16, 1914. LA SALLE.

ITEMS OF INSURANCE NEWS.

At a conference held in the offices of the Maryland Casualty Insurance Department in Baltimore the Manual Committee of the Workmen's Compensation Bureau submitted a basis of insurance rates of companies transacting ninety-three per cent of the business written in Maryland. Insurance Commissioner Shehan and the Maryland Industrial Accident Commission have decided upon a manual of minimum rates.

The Maryland Accident Commission has selected as counsel J. Walter Lord, Esq., who has for a number of years made a special study of American and European workmen's compensation legislation and is recognized as one of the leading authorities in this branch of underwriting. The commission has also selected Edgar S. Montell, for some years identified with a Baltimore casualty company, to prepare plans for operating the workmen's compensation bureau. The commission has under consideration a uniform policy which was submitted to the companies operating in Maryland and only two raised objections. After making a few minor changes the policy was referred to the counsel of the commission for his judicial opinion.

Insurance Commissioner Welch of Oklahoma, has been advised by the Attorney General of that State that in making deductions from premiums collected, for cancellations and dividends, to secure a basis for the State two per cent tax on foreign life companies' premiums, cash surrender values paid to policyholders in the State may not be deducted.

In the language of the opinion it was held that the cash surrender values may not be "embraced in cancellations and dividends within the terms" of the statute providing for the annual fees and taxes.

A system of investigating and approving all factory safety appliances and devices and labeling those approved is about to be put into effect by the Workmen's Compensation Service Bureau. This new departure in accident prevention endeavor will be undertaken on behalf of the bureau by the Underwriters' Laboratories, Inc., of Chicago, with which the bureau has affiliated for this special work.

The Underwriters' Laboratories, with its extensive plant and well established inspection and testing system, has facilities for extending its inspection work to cover safety life devices, and thereby render great service to the bureau members. When the plan is fully put in operation it is intended that the label of approval in use shall be applied to workmen's compensation and employers' liability risks which use the labeled appliances of the laboratories.

A revised plan for inspection of compensation risks was submitted at a special meeting of the Compensation Inspection Rating Board held last Wednesday and referred, after discussion, to a committee of five, with Edmund Dwight, chairman. The proposed plan for inspection is as follows:

(a) That the form of inspection report for each classification be so modified in all cases as to localize the defects or conditions for which charges are made so as to enable the insurance carrier from the inspection report to make proper recommendations to the assured for the improvement of the risk.

(b) That upon special request of any insurance carrier, and subject to a charge for the extra cost, the inspection report under existing inspection of any risk be amplified to localize the defects or conditions for which charges are made so as to enable the insurance carrier from the inspection report to make proper recommendations to the assured for the improvement of the risk.

(c) That upon special request and at the expense of the insurance carrier a preliminary inspection of any risk shall be made and report furnished thereon in such form as to enable the carrier to proper recommended thereon in such form as to enable the carrier to make proper recommendations to the assured for he improvement of the risk, such inspection to be followed within the first six months of the policy term by a final inspection for ratings.

The programme for transforming the Prudential Insurance Company of America from a stock into a mutual company is being carried out as rapidly as is permitted by the legal requirements to be met. At a meeting of the stockholders held at the home office in Newark, N. J., last week, 30,839 shares out of the total of 40,000 shares of the company's stock outstanding were voted in favor of mutualization. The principal step remaining to be taken is to procure the assent of the policyholders. For this purpose President Forrest F. Dryden will call a meeting of the policyholders, probably for November 15. Publication of the notice for four weeks in every State in the Union in which the company does business, and also in Canada, will be required.

At the annual meeting of the Surety Underwriters' Association of New York the following officers were elected: President, William H. Conroy, Massachusetts Bonding and Insurance Company; vice-president, Fred C. Williams, Globe Indemnity; secretary and treasurer, John H. Manning. Executive committee, Joseph A. Flynn, Fidelity and Deposit; W. M. Smith, Jr., Aetna Accident and Liability; C. Wilson Gott, Illinois Surety; Lester H. Moore, American Surety.

At the forty-fifth annual meeting of the Fire Underwriters' Association of the Northwest, held in Chicago last week, the following officers were elected for the coming year: President, B. L. West, Western department, Insurance Company of North America, Chicago; vice-president, John Fitzgerald, Indiana State agent, Queen Insurance Company, Indianapolis; secretary, Guy A. Richards, of Richards & Hecox, Chicago; treasurer, C. L. Hecox, of Richards & Hecox, Chicago; directors, for three years, Daniel W. Andrews, Gustav Wollaeger, Jr., Robert Raynolds; for one year, F. A. Dunning, W. J. Sonnen.

Following the unanimous vote of the stockholders of the Aegis Life of Denver the reinsurance of that company by the Central States Life of St. Louis has been negotiated by Vice-President James A. McVoy, of the Central States, and E. M. Grossman, attorney for the Aegis. The Aegis had about three and one-half million dollars of business in force and an income of about $120,000 a year.

Manager J. H. Lenahan, of the Nord Deutsche Fire Insurance Company, has completed negotiations for the reinsurance of the Georgia and Florida business of the Commercial Fire Insurance Company of Washington, D. C. The business carried by these States was conducted by the general agency of Rhett & O'Beirne, of Atlanta, who arranged for the reinsurance. The business of the Commercial Fire in Virginia has been reinsured in the City of New York.

The Kentucky Court of Appeals has affirmed the judgment of the Franklin Circuit Court, which requires the Provident Savings Life to pay the premium tax on policies which it reinsured in the Postal Life of New York. The opinion, which was written by Judge Carroll, contains the following language:

"A foreign insurance company doing business in this State will not be permitted to escape payment of taxes by reinsuring its policyholders in another company never authorized to do business in Kentucky."

At a meeting of the board of directors of the New Amsterdam Casualty Company last week the original plan formulated a year ago, when change of stockholders took place, was carried out. W. F. Moore, at his own request, was elected chairman of the board of directors and J. Arthur Nelson was elected president. The other officers of the company remain as heretofore, with the exception of additional assistant secretaries and vice-presidents, for purposes usual in a company conducting the fidelity and surety business.

Professor Dr. Alfred Manes, General Secretary of the German Association for Insurance Science (Deutscher Verein für Versicherungs-Wissenschaft) and Editor of the Zeitschrift für die gesamte Versicherungs-Wissenschaft, the official organ of the Association, is serving in the German army in a Bavarian cavalry regiment. There could be no better illustration of how the belligerent European countries are calling upon all their citizens, irrespective of their position in the community or the character of their services in other directions, to give up their peaceful pursuits and join the ranks. Readers of this paper have had more than one opportunity, through translations appearing in its pages, to become familiar with the ability and learning of Professor Dr. Manes; and they will hope that the fortunes of war will bring him safely back to his labors in the field of insurance.

It is stated in a cabled despatch from Paris, under date of October 10, published by "The Annalist," of New York, that: "The (French) Government has decreed the seizure of the assets of Austrian and German insurance companies and has appointed receivers for them."

FINANCE AND COMMERCE

FINANCIAL AND COMMERCIAL REVIEW

PROBABLY because of prevailing dispositions to regard the war crisis with exaggerated optimism there was a pronounced spread of depression throughout the financial and business community in the last few days on the actual developments in the European war. These included chiefly Germany's successful prosecution of a vigorous offensive which practically completed the occupation of Belgium, the German attack extending down toward the Channel ports following the fall of Antwerp; the indications that the Russian armies were not only making no headway in the Eastern theatre of war, but were retiring and the outbreak of Boer rebellion in South Africa stimulated by German intrigue.

The natural consequence of such events was to send a chill through the supporters of schemes for the restoration of banking and business activities on the theory that the Allies in general and Great Britain in particular were not threatened dangerously by the possibilities of German victory. A secondary implication was that hopes of a comparatively early termination of the war could not be reasonably entertained except on the ground of a sweeping German triumph which would not square at all with the predominant views in this country of the most desirable ending of the conflict. It was also implied that in a war of protracted duration there must be much more adequate reckoning than has been so far apparent with the varying contingencies of the fortunes of war.

One thing which these developments undoubtedly did was to lend enhanced interest to the proposals to be submitted to our Government and to our financiers by the official representatives of British finance, which includes the British Treasury, sent to this country for the purpose of considering the difficult situation in foreign exchange and the troublesome problems of the suspended securities and cotton markets. It would seem hardly likely that Washington will incline very much, nor that our bankers will feel, that we can afford to venture very far in the direction of allying ourselves economically with the war fortunes of Great Britain. However, the initiative which British finance has taken in steps to relieve conditions that are preventing a revival of domestic banking and business activities are none the less welcome and there is room for much to be done without running excessive hazards.

Apropos the war there is little to be gained by the premature counting of its costs. Statisticians are exploiting a good deal of newspaper space with figures setting forth estimates that the war expenditure is ranging from $30,000,000 to $50,000,000 a day in the aggregate for all the belligerents, as well as for the neutral nations which are mobilized against possibilities. The excuse for these computations is suggested by the question invariably asked after the footing has been rendered, namely how long the contestants can keep up such a dire waste as is denoted. The trouble with this form of reasoning is that it is precisely the argument in which pacificists indulged for years before the war to prove that a general war in Europe could never occur.

It is conceivable that utter financial exhaustion may be the direct cause of the ending of the awful conflict that is now raging, but there is no comfort for anybody in such a conclusion. If exhaustion of that sort finishes the war it will mean the total ruin of Europe. The real cost of the war is to be reckoned after it is finished, and perhaps it will be some advantage to ourselves if we try to imagine the colossal dimensions of the bill of destruction that will then come in. We may thus begin to get some approximate understanding of what this catastrophe signifies and so prepare ourselves all the better now to adopt those measures and institute those processes which may serve to diminish somewhat the hardships and distress which must inevitably follow in the train of war.

About the most encouraging feature of the moment is the unmistakable manifestation of improvement in domestic monetary conditions. It is not safe to assume that this means very much more than that trade and industry are steadily contracting. At the same time it is of help to the situation to have some of the strain of money market tension lifted from whatever cause, and that it is being lifted cannot be doubted. The shading of commercial paper rates has been carried further, some discounts as low as six per cent being reported for names of very high grade and toward the week end Wall Street banks offered money at 7 per cent for new loans on collateral security.

This to an extent is the result of a gradual widening of the supervised market for cash dealings in securities of all descriptions except shares listed on the Stock Exchange. The Stock Exchange authorities and the banks have been feeling their way very carefully, but their prudence has been rewarded by the accommodation of a considerable decline in security values without any disturbing shock. Already prime bonds are changing hands at declines of six to seven points from the level which obtained at the end of July, but although only a limited market is furnished there is still a market for purchases and sales. In consequence a reduction of loans has been facilitated which has been assisted further by the customers of brokerage houses who have taken up outright securities that had been carried on margins.

We seem nevertheless to be a long ways from a reopening of the Stock Exchange. This is an event which must apparently wait upon some real relaxation in foreign exchange and on some arrangement with Europe to accept for the return of American securities payment in such ways as we can make it. Foreign exchange conditions are baffling to the last degree. The operations of the gold fund committee have been helpful in that they have assured an ultimate supply of exchange, but the committee has after all sold no large amount of bills, and the presumption is that it has been marking time until it could be seen what was intended by the visit of Great Britain's financial representatives and to what this was going to lead.

Our foreign debit balance must be very large indeed and because imports are keeping up remarkably under the stimulus of European liquidation of goods and commodities our present export trade movement is gaining on our indebtedness abroad but slowly. Still the outward movement of merchandise is visibly increasing and Washington has stated officially that an average of daily trade balances in our favor is now accruing. The progress which the New York clearing house banks and trust companies have made

in cutting their reserve deficit $40,000,000 from the August maximum is most reassuring as it has taken place in an interval of large demands on the country's financial centre for the provision of gold for export.

Our bankers on the whole have, with very little recourse to governmental assistance, handled the crisis so far most commendably, and it is worth observing that the sanest proposal yet for dealing with the cotton problem is contained in the bankers' plan for a $150,000,000 pool to furnish loans on cotton. There are objections to be offered to this scheme, but none that are very valid if it is made on adjunct to the reopening of the cotton exchanges and the restoration of the contract market which will, in economic fashion, take care of the large surplus of this year's cotton yield.

The grain markets have reflected the war news with another upward reaction under the leadership of wheat. It is obvious that every fresh sign of a prolonged war will evoke a rising response from staple foodstuffs. Trade reports only go to confirm in the main all the indications of a progressive slackening of industry. Operations at steel mills must now be about half capacity and the percentage is declining all the time.

Next week hearings in the reopened Eastern rate case will begin and much anxious attention will be directed toward the proceedings. Considering the part which railroad finance and railroad enterprise have played in the past expansion of domestic business of all sorts it is more than probable that the prospects of at least a partial business recovery are dependent on the Interstate Commerce Commission's disposition of this matter. Whether or not the commission alleges emergency as the excuse for reversing itself, if it makes a liberal grant of rate increares to the carriers, investment all over the country will be encouraged and capital will become more available than it is to-day for the employment in any direction.

There is more than a suggestion in new attitudes at Washington that governmental bodies and individuals have begun to see business in a different light than that in which it was regarded before the war showed its utter dependence on incentives to accumulate capital and invest it. Not the least of the hopeful changes is betokened by the announcement that the Administration party in the forthcoming Congressional campaign will proclaim a truce in the political crusade against big business.

COTTON

October 17, 1914.

COTTON markets in the sense known to the world for more than a generation past cannot exist so long as the great cotton futures exchanges in this country and England remain closed. Inasmuch as not one of these exchanges has yet found itself in a position to reopen, all that can really be recorded of the trade in cotton during the past week must have reference to the scattered purchases and sales for cash which are being made from day to day throughout the South. Reports of these sales show that, in spite of the determination of great numbers of farmers to carry their cotton back to their farms, rather than accept such prices as are now offered for it, there still remains a sufficient surplus of cotton that must be sold to make each new day's Southern quotations a little lower than those of the day before. It may be said that for the generality of interior markets, except those in close proximity to Southern mills, the price of middling has settled squarely to the level of 6 cents per pound; and there is no inconsiderable quantity of cotton that can be bought at an even lower price than this. Cotton is now cheaper in the South than it has been at any time since the early Spring of 1898; and it goes without saying that the price is far below the present cost of production of any cotton at all, no matter how favorable may be the conditions under which it is grown. Could the Southern farmers be convinced that they could not possibly get more than 6 cents per pound for any cotton they might raise next season, there would virtually be a total cessation of cotton production from one end of the South to the other. As things now are, however, even at this ruinous price the demand is inadequate to take care of all the cotton offering, and it is entirely possible, assuming that no outside assistance is rendered, that a still further decline is ahead of us. And the cruel par of the matter, from the standpoint of the cotton producer, is that there is not a single thinking person, familiar with cotton, in the world, who does not believe that the purchase of cotton at persent prices is equivalent to seizing one of the greatest opportunities for profit ever afforded in this country. All would like to buy cotton now and at this price; but all the machinery for doing so is out of order, and the opportunity must be let slip. Spinners can borrow from their banks only money enough to buy a small part of the season's requirements at a time; merchants can only buy such cotton with one hand as they can sell with the other to spinners, being deprived of their indispensable basis of credit, the hedging of their stock of cotton by means of future contracts sold on the cotton exchanges; speculators cannot buy because they have no acquaintance with the problems of warehousing, insuring and borrowing upon cotton; exporters cannot buy because they cannot sell their bills of exchange upon foreign markets, not because such bills are undesirable and discredited, but because there are no bankers in the foreign markets who are in a position to accept them. So the Southern cotton producer is left with his cotton precisely where the great London banker is left with his overdue German acceptances; both have valuable property, but neither can get his money out of it without waiting for an indefinite period, until the world is once more at peace. In the meantime the seething pot of projects, political and other, for assisting the South in its plight continues to boil, and perhaps with more violence as time goes on. A mere catalogue of the bills offered in Congress, most of which in the last analysis mean simply diverting the money of the country as a whole to the South, would be of interminable length. In scarcely one of them is there a gleam of economic sense or the faintest indication of regard for the ultimate consequences, even to the cotton producers themselves, of what it is proposed to do. Easily the most vicious of these measures seem to be fathered by Senator Hoke Smith, of Georgia, who has finally pushed his propositions so far beyond the uttermost limits of governmental and financial sanity that they have become hardly more than the laughing stock of the Senate. It is therefore a refreshing fact to report that every indication points to a total failure of Congress to act upon the matter at all. Better that the South should have a year of privation than that governmental policies pregnant with future harm should be adopted even in this severe emergency. Outside of Congress, there is one proposed plan of relief for the South which cannot be criticised as demagogic, no matter what may be said of its indeterminations on the practice and technical side. This is the plan of the St. Louis banker, Mr. Festus J. Wade, to provide $150,000,000 of banking credits for the carrying of cotton. So far has this plan advanced that the required $150,000,000 has already been pledged by banks from one end of the country to the other. What is lacking is dependable machinery for loaning this money on cotton. Much has been assumed throughout, as that there will be no trouble in obtaining fire insurance on 5,000,000 bales of stored cotton, nor in procuring guarantees of the trustworthiness of the warehouse receipts fom surety insurance companies, nor in arranging that warehouse receipts serving as collateral can be kept instantly available for the owners of the cotton, should they wish or need to sell. We would not appear to be discouraging about Mr. Wade's considerable project, which at least has the advantage over all other projects as yet advanced, that the money needed for its realization is in hand and not proposed to be obtained in some vague way in the future, whether from the banks or from the Government. We cannot, however, say that we are confident that it will do the good which is expected of it. The really encouraging thing in the situation, as we see it, is that the cotton trade itself, acting through its exchanges, has almost reached the point where it can resume its normal activities. The best information is that the New York Cotton Exchange will have proceeded far enough with the adjustment of its affairs to reopen not much after November 1. After the amateurs, congressional and other, have tried their hand, it will be interesting to see what happens when the cotton trade has its innings. It may happen that more buyers of cotton will be discovered in a day on the cotton exchanges than the amateurs have discovered in the past three months.

THE CONTRACT MARKETS

THE NEW YORK COTTON EXCHANGE.

The following were the high, low and closing bid prices for each delivery, on Friday, July 31, in cents and hundredths of a cent per pound, gross weight:

The MOVEMENT OF THE AMERICAN CROP.

The American crop year has been changed to run from August 1 to July 31, and all comparisons are made up accordingly.

The following tables, derived from the New York Cotton Exchange, show the movement of the American cotton crop for the past week and since August 1, 1914, with comparisons for previous years:

CROP MOVEMENT INTO SIGHT.

Weekly Movement.	1911-12.	1912-13.	1913-14.	1914-15.
Port receipts	483,227	510,540	483,611	202,157
Overland to mills and Canada	26,172	18,344	30,047	13,125
So. mill takings, est., exclusive of takings from Southern ports.	85,000	85,000	85,000	55,000
Gain of stocks at interior towns	67,048	61,059	71,385	116,336
Brought into sight for week	661,447	674,943	670,043	386,718
Total Movement—				
Port receipts	2,838,135	2,574,913	2,647,380	817,640
Overland to mills and Canada	67,527	50,788	93,389	34,390
Southern mill takings..	482,032	455,873	494,796	228,000
Stocks at interior towns in excess of Sept. 1..	349,299	274,711	251,222	402,857
Brought into sight thus far this season	3,736,993	3,356,285	3,486,787	1,482,887

The total crop movement is respectively for 81 days, 79 days, 78 days and 77 days.

CENSUS BUREAU REPORT ON CONSUMPTION AND DISTRIBUTION OF COTTON IN SEPTEMBER.

On Wednesday, October 14, the United States Census Bureau issued its monthly cotton supply report, giving the consumption, distribution and supply of cotton in the United States for September, 1914. The figures, with comparisons for September, 1913, are given in the following tables,—round bales being counted as half bales and bales imported from foreign countries being reduced to equivalent 500-pound bales (net weight):

CONSUMPTION AND ACTIVE SPINDLES IN SEPTEMBER.

	Consumption		Active Spindles	
	1913, Bales.	1914, Bales.	1913, No.	1914, No.
In mills in the Cotton States	240,935	229,510	12,009,006	12,257,006
In mills in all other States	201,500	185,684	18,625,375	18,305,179
Totals for United States	442,435	*415,194	30,634,381	30,562,185

*Includes 14,148 bales of foreign cotton.

STOCKS OF COTTON IN MILLS AND IN WAREHOUSES ON SEPTEMBER 30.

	In Manufacturers' Establishments		In Independent Warehouses	
	1913, Bales.	1914, Bales.	1913, Bales.	1914, Bales.
In the Cotton States	196,522	161,404	1,269,892	1,550,794
In all other States	418,059	394,664	25,263	111,062
Totals for U. S.	614,581	†556,068	1,295,155	‡1,661,856

†Includes 58,163 bales of foreign cotton.

‡Includes 12,214 bales of foreign cotton.

IMPORTS AND EXPORTS OF COTTON IN SEPTEMBER.

Imports from	1913. Bales.	1914. Bales.	Exports to	1913. Bales.	1914. Bales.
Egypt	4,000	8,912	United Kingdom	376,426	50,980
Peru	1,328	516	Germany	290,805	.....
China	413	1,201	France	131,950	.....
All other countries	1,708	4,686	Italy	45,290	16,678
			All other countries	85,857	58,120
Total imports	7,449	15,315	Total exports	930,328	§725,778

§Includes 188 bales of linters.

The consumption of cotton in the United States during the two months ended September 30, 1914, was 798,874 bales, against 874,785 bales in the same period in 1913.

The consumption of linters in the United States during the two months ended September 30, 1914, was 52,669 bales, against 54,327 bales in the same period in 1913.

* * *

The Jute Crop of 1914 and Present Market Conditions.—A recent Consular and Trade Report, issued by the Department of Commerce in Washington, quotes from "The Glasgow Herald" a despatch from Dundee, Scotland,—the most important jute manufacturing centre in the world outside India,—with regard to this season's jute production and also with regard to present market conditions for jute and jute products in Dundee. The substance of the despatch is as follows:

"The official estimate of this year's jute crop places it at 10,440,000 bales, against 9,836,675 bales (actual crop) last year. The acreage given to the crop last year and this was 3,181,514 and 3,359,000, respectively. The average crop increase per acre was only .02 of a bale, using the estimated 1914 crop figure in the calculation.

"The full consuming capacity of the world in normal times is close to 10,000,000 bales a year. The exclusion of Germany and Austria at the present time means at least 1,000,000 bales, while there are other countries which will be unable to use their regular amounts. There is therefore plenty of jute in India. Business [in Dundee] is very quiet, and prices on the raw stock are declining. Spot jute has been quite neglected, notwithstanding the greater difficulty in shipments, and yarns were dull also. Sacking sizes are also off in sale, while the sacking cloth trade gives evidence of a pause, even in the trades that have been a matter of great urgency of late. There has been little doing all around, even in the matter of testing prices."

* * *

Area Planted to Cotton in India.—The following table, published by the "Indian Trade Journal," shows the estimated acreage of land planted to cotton in India in 1914-15, compared with the two preceding years. The memorandum is based upon reports furnished by provinces which comprise about 76 per cent of the entire cotton area of India.

ESTIMATED COTTON ACREAGE OF INDIA.

Provinces and States.	1914-15.	1913-14.	1912-13.
	Acres.	Acres.	Acres.
Bombay (Deccan)*	1,794,000	1,639,000	1,357,000
Central Provinces and Berar	4,646,000	4,506,000	4,222,000

Central India	*890,000	1,328,000	1,137,000
Rajputana	366,000	388,000	298,000
Mysore	11,000	15,000	11,000
Totals	14,710,000	14,833,000	12,095,000

* Including Native States.

In this connection it is interesting to note that the Government of Bombay, through its direct officers, is advising local agriculturists to grow wheat and other grains instead of cotton. It has been pointed out to them that the prices of cotton are too low and will probably go down further owing to the war, while a good demand will spring up for foodstuffs from Europe, and they are likely to bring good prices.

NEW YORK QUOTATIONS FOR STANDARD COTTON GOODS AND YARNS

The following are quoted prices in the New York market for typical standard cotton goods (in cents per yard) and cotton yarns (in cents per pound) on Saturday of last week and on Wednesday of the present week:

Cloths.	Saturday.	Wednesday.

Estimated Per Capita Consumption of Wheat in the Leading Countries of the World.—The "American Miller," in a recent editorial, calls attention to the United States Government estimates of per capita wheat consumption in the leading countries of the world. Although the editorial is inclined to doubt the correctness of the estimates, they are of value as being probably the most accurate figures available on the subject. We quote as follows:

"The estimated consumption is based on the average production for ten years, exports and imports of wheat including flour, with an allowance made for quantities used for seed. Exports and imports may be arrived at with tolerable accuracy; but the crop production is only an approximation, and the amount used for seed is also an estimate. Nevertheless, the Government believes that the figures it gives for the consumption of wheat per capita in different countries are less than 10 per cent in error and that for the United States the consumption given is a minimum of probability and may be an underestimate of 2 to 4 per cent. The grounds of such confidence are hard to comprehend.

"Excluding the amount used for seed, the per capita consumption of wheat for a period of ten years is given as follows [in bushels]: Canada, 9.5; Belgium, 8.3; France, 7.9; Spain, 6.1; United Kingdom, 6.0; Switzerland, 6.0; Australia, 5.5; Italy, 5.4; United States, 5.3; Uruguay, 5.3; Argentina, 5.2; Bulgaria, 5.0; Austria-Hungary, 4.3; Netherlands, 4.2; Roumania, 4.0; Denmark, 3.5; Chile, 3.4; Germany, 3.2; Russia, 2.7; Servia, 2.5; Sweden, 2.5; Egypt, 2.5; Portugal, 1.8; British India, 0.8; Mexico, 0.8; and Japan, 0.5."

That these figures cannot be used very accurately to estimate the per capita consumption of flour is clearly shown by another editorial in the same issue of the same paper. In answer to an inquiry as to "the average quantity of finished flour obtained from one bushel of wheat and also the average quantity of by-products (bran and shorts) obtained from one bushel of wheat, the "American Miller" says, in part:

"Can there be any such thing as an 'average yield,' except for a certain kind of wheat in a certain season and in a certain mill? We think not. Certainly we would not know how to go about figuring an average. There are tolerably well authenticated cases of a barrel of flour being made from four bushels and twelve pounds of wheat. That makes the flour yield over 77 per cent. A common figure is four bushels and thirty pounds; that makes a flour yield of about 72 per cent. Probably the commonest actual figure is five bushels; that makes the flour yield something over 65 per cent of the weight of the wheat.

"And the actual figures published show exactly this wide divergence. One test with Minnesota hard wheat showed a flour percentage of 75, shorts 11.6 per cent and bran 13.4 per cent. Tests of Kansas wheat showed a variation in flour percentage from 69.58 to 75.19 per cent. Tests with Tennessee wheat showed an average of 14.11 pounds of flour per bushel which is something over 70 per cent. Washington wheat showed 14.31 pounds of flour per bushel. Kansas samples showed 73.22 per cent of flour. In the Kansas samples the average percentage of bran was 18.54 per cent of the weight of the wheat and of shorts, 6.83 per cent. These samples included all sorts of wheat from the best to the poorest. In the Minnesota samples, which averaged better wheat than the Kansas samples, the average percentage of bran was about 17 per cent and of shorts, 6.53 per cent."

* * *

The Assessed Valuation of New York City.—The assessed valuation of New York City is approximately one-third of the total assessed valuation of taxable property in 184 leading cities of the United States, with a population of more than 30,000, according to the "Real Estate Bulletin." The total assessed valuation of taxable property in these cities was $26,059,387,438 in 1910. Of this total, $17,491,117,653, or 67.2 per cent, was in eighteen cities which have a population of more than 300,000.

The assessed valuations in some of the largest cities are shown as follows:

Total property:		Real property:	
New York	$8,322,958,952	New York	$7,044,192,674
Chicago	848,994,536	Chicago	603,022,875
Philadelphia	1,458,851,880	Philadelphia	1,457,108,534
Boston	1,409,479,723	Boston	1,118,992,100
Jersey City	241,561,118	Jersey City	184,481,409

The basis of assessment in the above cities are: New York, Philadelphia, Boston and Jersey City, 100 per cent; Chicago, 33 per cent. Chicago's totals should therefore be multiplied by three for comparison.

Statement of the ownership, management, circulation, etc., required by the Act of August 24, 1912, of The Market World and Chronicle, published weekly at New York, N. Y., for October 1, 1914.

W. B. MARSH, Business Manager

IT is impossible not to follow with great interest the newspaper accounts of the purposes and reports of the utterances of the distinguished English financial authority, Sir George Paish, who is now in the United States on a mission to arrange with our Government and with our representative bankers and business men such an adjustment of the financial obligations of the United States towards Great Britain as will facilitate the resumption of normal financial and credit operations in the latter country. It may be assumed that more than one of the plans which it is asserted Sir George Paish has in mind to propose or has actually proposed in a tentative way, are more fanciful than real. In the nature of things, the true object of his visit must be to see what can be done here in the way of strengthening England in her vast undertaking to carry her war to a successful conclusion. Suddenly and, as we believe, most unexpectedly to herself, England has found herself in a position in which she needs to have in hand a very large part of the resources which she has been accustomed to leave in other countries, employed there to her profit and to the profit of those to whom she entrusted it. And, in so far as this is humanly possible, she needs these resources, not in the shape of the commodities she has customarily taken in payment of interest or of such portion of her capital as she might choose to call in, but in actual money, at least at the start. All the nations of the earth, except possibly France and the Scandinavian countries, are debtors to England; and the chief of these debtors is the United States. Here she has invested more of her capital than anywhere else; here she sells more of her own products than anywhere else; and here more than anywhere else she expects to collect, through international exchange operations, the balances from other countries, like Brazil, to which she advances capital and sells goods. For so many years that we have forgotten any other order of things she has been able and willing to accept in payment of what we annually owe her, our cotton, our grain, our provisions and a great variety of our specialized manufactured articles. She has seldom called upon us for money in any amount. But in her present situation, she feels that, except for our foodstuffs, it is unwise for her to take and carry more than day-to-day stocks of our commodities and manufactured products. Like the sound business man who foresees and prepares for heavy drafts upon his resources, England now wants cash to put into the bank; and there can be little doubt that the real occasion of Sir George Paish's trip across the Atlantic is to ascertain how large a part of our indebtedness to Great Britain can be met by us in this form.

The first impulse of the debtor, when any change is proposed, not in the stipulated but in the usual and expected method of meeting his obligation, is to resent the fact and to feel that his rights are being invaded by the creditor. He attributes his own embarrassment to the unreasonableness and arbitrariness of his creditor. Economic history is full of illustrations of this truth, one of the most striking being the Free Silver agitation here in the United States, which was attributable in the last resort to the belief of Western borrowers of Eastern money that the decline in the prices of agricultural commodities in terms of gold, so severe in the last years of the past century, substantially altered the conditions of the indebtedness and made it iniquitous for the lenders to demand payment of interest and principal in gold. Similarly, there is no denying that on the present occasion there has been a widespread feeling among American business men, bankers, and even officers of the Government, that England, no matter what her necessities, has no right to change suddenly her practice of accepting payment from us in kind and to urge that we pay her in money. It has been only too apparent that the change is disadvantageous to us in at least two important regards: in the first place its immediate effect is to weaken our own financial and credit position; and, in the second place, it leaves our commodities, such as cotton, on our hands, to the serious depreciation of their market value, instead of giving us the most important of the usual remunerative outlets for them. And this latter burden upon us happens at this time to be the more grievous, because the war has absolutely deprived us of other outlets hardly less indispensable. In short, large numbers of people in this country can and do point to what appear to them to be substantial reasons why it is not equitable that we should be pressed by England for payment of our indebtedness, or a large portion of it, in the form that now best suits England's own situation. They resist in principle the remittance of large sums of gold to England; they urge that it is the first duty of this country to protect its own business interests and that the credits required by those interests should not be exposed to the danger of restriction by reason of the withdrawal of gold in quantity; they are for applying to our obligations to England the same moratorium which England herself applied in the first weeks of utter confusion consequent upon the outbreak of the war; and they argue that, as we are not immediately concerned in the war, it is highly improper that we should be compelled in effect to pay no inconsiderable part of the cost of it.

It is obvious that there are questions here, which, treated tactlessly, might give rise to no small amount of bad blood on both sides. Thus, the fundamental question of the absolute duty of debtors to creditors, or of a debtor nation to a creditor nation, is one of infinite complexity in fact, in spite

of its simplicity in appearance. The bald principle that creditors are entitled to be paid what is owed them and that it is the duty of debtors to pay what they owe, when called upon to do so, will not bear a moment's critical examination from the point of view of the present economic organization of the world. And this is the more true because those who assert the principle as governing are invariably found to have implicit in their thought the notion that because debts are stated in terms of money, therefore it is always money which debtors owe and ought to pay. How fallacious this notion is appears immediately if debtors as a class are set over against creditors as a class, and it is argued that in principle the former may be called upon to settle with the latter in money all at the same time. There is not money enough in the world to make this possible. It is not even possible for limited classes of debtors to settle all at once, or within a short space of time, with their creditors in money. The savings banks in the United States, for example, could not do it in a period of many months without causing general ruin. And *a fortiori* a great borrowing country like the United States could not undertake to settle in money with a great lending country like England, without utter economic disaster to both countries.

The very possibility of the settlement of obligations between debtors and creditors in money, then, is completely dependent upon having only a relatively small number of such settlements take place at the same time. *En masse*, these settlements are impossible and even unthinkable in the modern economic world, as it has come to be. General settlements of indebtedness between large classes of individuals or between nations can only be accomplished through credits, which are really the values of commodities or services in course of exchange, but translated into terms of money. And so evident is this truth that it must be assumed that lenders as a class, or the citizens of a great lending nation like England, are fully aware of it; and that it is indefensible for them to set up the claim that what was lent by them was money and that they are absolutely entitled to money in repayment of their loans. Indebtedness to-day, in a general economic sense, is immeasurably removed from indebtedness in the Middle Ages when only actual money was lent and when equivalent money might with some show of equity be demanded in payment of the debt. To-day, in the overwhelming majority of cases, credit, —i. e. the value of commodities of some kind,—is lent; and the debtor may fairly expect to repay with credit, if money is not available.

This is the large economic truth of the matter; and if England, because of her present need of money in the bank, were to revert to the mediaeval conception of her rights as a creditor, the result in this country could only be growing indignation and resistance. And yet it is just as true that the debtor is under the most imperative obligation not only to pay his debt but also to accommodate the payment, within the bounds of reason and human possibility, to the desires and needs of the creditor. In normal times, the individual debtor is unquestionably in duty bound to repay his creditor in money, if the latter calls upon him to do so. Our economic system makes this possible, just as it makes it possible for the borrower to get his loan in money, if he desires; and the duty of repayment in money is co-extensive with the possibility of borrowing in money. The same principle appears as between borrowing and lending nation. In so far as it is possible, without economic ruin, for the debtor nation to pay its debts to the creditor nation in money, if the latter desires it, it is a plain duty for the debtor nation to do so, and not to assert an absolute right to repay only in kind. In the present instance, therefore, there is not only not the slightest impropriety, but rather the clearest justification for England's calling upon the United States to marshal all its resources in money, and to pay England in money the largest possible portion of its indebtedness consistent with the maintenance of a sound economic and credit situation in the United States itself. Nor is it a tenable argument against this that the United States is not directly engaged in the European War and should not be expected to bear any part of the cost of that war. It is a general truth that the borrower, by the very act of assuming the obligation of a debt to the lender, makes himself to a degree dependent upon the fortunes of the lender. He must be prepared to suffer loss, if need be, in case the situation of the lender becomes such that the latter requires for his own use what he has lent. This truth is seen illustrated on all sides at all times.

That the United States at the present moment owes England, in the way of matured indebtedness, a large sum,—perhaps $500,000,000,—nobody would venture to deny. Equally undeniable, on the other hand, is the fact that this indebtedness could not be paid in full in gold, without economic ruin to the United States. Somewhere between paying the entire indebtedness in gold and paying none of it in gold, lies the present duty of the United States. Sir George Paish, as financial adviser of the British Government, has come to us to ascertain, if possible, how much of our debt we can pay in gold, and how much of it England must expect to get in other forms of payment. This is a wholly reasonable quest, and deserves to be treated by us as such. And there is all the more reason so to treat it, because Sir George Paish himself is a widely and deeply experienced man of affairs, completely familiar with all the commercial and financial inter-relations between this country and England, conversant with the most intimate details of our credit and banking situation, and probably better able than any other man living to bring about wise co-operation between those who are doing the constructive work in restoring normal economic activity in the United States and those who in England are bearing the double burden of making adequate and dependable provision for the awful cost of the war and of setting in order the disturbed machinery of world-wide credit, whose functioning is of such inestimable importance to every people on the globe.

We have no information, other than that contained in the newspaper reports, as to the proposals which Sir George Paish is making or is prepared to make to the officers of our Government or to our financial and commercial leaders with respect to the adjustment of our obligations to England. As has been indicated above, we cannot think that all which the newspapers have said on the subject can be correct. We do not think, for instance, that there can be substantial truth in the intimation that Sir George Paish is holding out the prospect to us of paying a large part of our present matured or maturing debt to England in cotton, to be bought *en bloc* and stored as a cotton reserve by the British Government. However much we might wish this to be true, for the sake of American cotton producers, we cannot believe that at this juncture England is prepared to em-

bark on what after all would be a gigantic speculation in cotton. We assume rather that he is discussing appropriate means for making available some portion of our vast supply of superfluous gold,—not by drawing it from our banks, but by wringing it out of our gold saturated circulation,—and getting this gold to London, where it will serve the double purpose of paying a part of our indebtedness to England and of serving as a basis for many fold its own amount in international credits, of which we as well as England herself will get the benefit. We suppose, further, that Sir George Paish is studying ways and means for co-operative action between the London securities market and our own stock exchanges, so that on both sides of the water dealing in securities may be resumed under such supervision and control that there may be no danger of insensate trading, with its possibilities of an irrational collapse of prices, spreading technical, even though not intrinsic insolvency in all directions. These are the lines of fruitful activity for Sir George Paish to pursue in this country at the present moment; and we are willing to believe that his sagacity, so often demonstrated in the past, has led him to them. He can do both us and England great good in these matters; and we deem it of good augury that it is the general opinion that this is the case.

Arthur Richmond Marsh

THE TEXTILE INDUSTRY IN GERMANY

By A. Raffalovich*

Translated from "L'Économiste Français"

IT is astonishing to mark the intense industrialization of the textile business during the last thirty years. By the term industrialization should be understood the establishing of large plants in place of those of medium or slight importance. In thirty-two years the number of establishments in Germany has diminished 60 per cent, while that of the workers (both sexes) employed has increased 17 per cent. This development is explained by the increasing use of machinery. Another development is the decrease in the number of male operatives employed and the increase in the number of women, which now exceeds a half of the working force.

	Establishments.	Workers.	No. of Men.
1875	403,024	926,767	610,220=66%
1882	406,574	910,089	547,951=60%
1895	248,617	993,257	532,037=53%
1907	161,218	1,088,280	529,899=48%

In 1907, the motive power used in Germany (steam and electricity) was estimated at 986,000 horsepower, having doubled in twelve years. From 1895 to 1907, the working force increased 9 per cent, the motive power 86 per cent. In 1895 a census of machines was taken, showing 5,304 combing machines, 10,000,000 spindles, and 448,574 looms, knitting machines, etc.

The textile industry is customarily divided into seven parts: (1) preparation of fibres; (2) spinning; (3) weaving; (4) knitting; (5) embroidery, laces; (6) bleaching, printing, dyeing, finishing; (7) trimming. The spinning mills form the largest group of establishments, after which come establishments for preparing the fibres, bleaching them, dyeing and printing. On the average, each spinning mill uses 154 horsepower and 10 kilowatts, the preparing plants come next, but some distance behind, with 24 horsepower and 2 kilowatts, and then the weaving establishments with 6 horsepower and 5 kilowatts.

On the other hand, if an attempt is made to distinguish between the different classes of fibre, it appears that cotton takes first place in number of establishments, consumes two-thirds of all the motive power used (464,072 horsepower, 37,253 kilowatts), wool employing a fourth (207,600 horsepower, 10,746 kilowatts). Electric power is largely used in silk manufacture (7,524 kilowatts).

As has already been shown, the textile industry is centered in different parts of Germany, although it is found in almost every part of the country's territory. Of the total working force employed in the different States, 41 per cent is in Prussia, 30.2 per cent in Saxony, 7.2 per cent in Alsace-Lorraine, 7.4 per cent in Bavaria, 4.8 per cent in Wurttemberg, and 3.4 per cent in Baden. Progress has been made in Saxony, Bavaria, Wurttemberg and Baden, but a falling off appears in Prussia and Alsace-Lorraine. In Prussia the greatest number of textile workers are found in the province of the Rhine, followed by Silesia, Brandenburg, Westphalia, Saxe-Royale, and Berlin.

Spinning is of chief importance in Upper Alsace, then Dusseldorf, Zwickau, Chemity, and Leipsic; weaving in Dusseldorf, Bautzen, Upper Alsace, Frankfort-am-Oder, Zwickau, Breslau, Chemity, Liegnity, Upper Franconia, Aix-la-Chapelle, Minister Souabe, and Lower Alsace. Knitting is principally carried on in Saxony (two-thirds), and at Wurttemberg (one-fifth). As for the industries which finish the product, they are mostly found in Alsace, the Rhine, Silesia, and Westphalia. The manufacture of trimming has its centre in Saxony.

The large plants (that is to say those employing more than fifty workers) employ 71 per cent of the total number of workers engaged in the preparation of raw materials (16,189 out of 22,798), 90 per cent (184,308 out of 107,205) in spinning, 74 per cent (375,000 out of 486,000) in weaving, 47 per cent (49,000 out of 103,000) in knitting, 66 per cent (77,251 out of 118,000) in bleaching and finishing, and 38 per cent in trimming. Out of 106,582 plants, 3,915 are estimated as having more than 51 workers; 981 from 200 to 1,000; 33 more than 1,000 workers; 7,538 from 6 to 50; and 95,129 from 1 to 5. In 1907 there were reckoned to be 15,386 weaving plants employing 867,657 persons, of which 459,016 were women and 408,641 men, 44 per cent being in Prussia, 26 per cent in Saxony, 8 per cent in Alsace-Lorraine, 7 per cent in Bavaria, and 5 per cent in Wurttemberg.

Three hundred and twenty-six plants, with 569 million marks [mark equals 23.75 cents] of capital, and 121 million marks of surplus made up the total stock companies; their debt obligations were 133 million, with mortgages to the amount of 34 million. Two hundred and ninety-two companies had a total profit of 88.5 million marks; 27 showed losses to the amount of 2.9 million marks. Two hundred and seventy-two companies paid together 53 million marks in dividends. The largest number of companies (114, with total capital of 247 million marks) were employed in the manufacture of cotton. The oldest of these (a spinning and weaving mill) was founded in 1835, at Augsbourg. From 1850 to 1860, 27 companies were formed; from 1861 to 1870, 16; from 1871 to 1880, 17; from 1881 to 1890, 89; from 1891 to 1900, 91, of which 24 were established in 1899. Between 1904 and 1910, 66 companies were founded, 16 of which in 1909.† This kind of enterprise appears principally in Alsace (32), then in Bavaria (28, of which 15 are at Augsbourg). According to the business census of 1907, out of a total working staff of 1,088,000 persons, there were 857,000 work-

*This is a sequel to a previous article by M. Raffalovich, published in translation in THE MARKET WORLD AND CHRONICLE for August 8, 1914, p. 167.

†In 1912, there were founded fifteen companies with total capital of 21.6 million marks; in 1913, fifteen companies with total capital of 17.8 millions.

ingmen, 41,000 office employes, and 27,000 technicists and superintendents.

The industry of the home, the small domestic establishment, is disappearing more and more; employing 287,129 persons in 1882, it employed in 1907 only 138,000. Of this latter figure, weaving occupied 70,250 or 70 per cent, embroidery and knitting 17 per cent, and laces, lingeries, etc., 15 per cent.

Although, in the early days, the textile industry used principally, if not exclusively, native raw materials (flax, hemp, wool) or silk from Italy and France or cotton from the Orient, America, the Antilles and Brazil, to-day this branch of German production could not be carried on if cut off from foreign supplies.

The following table shows, for the period since 1859, the imports, the exports and the stocks of raw materials in the country (in tons):

	Imports.	Exports.	Stocks.
1859	93,388	39,481	96,907
1875	312,670	110,925	201,645
1895	786,013	144,699	639,314
1910	965,415	181,200	784,215

In fifty years, imports have increased tenfold, exports have quadrupled, and consumption has increased twelvefold, now absorbing five-sixths of the imports. If a comparison is made of values (in millions of marks), it appears that, from 1875 to 1910, imports jumped from 613 million marks to 1,436 millions, exports from 205 millions to 280 millions, and consumption from 407 millions to 1,156 millions. If, instead of taking the totals for all kinds of raw textile material, a more detailed analysis is made, the following developments appear to have taken place from 1859 to 1910:

	1875. Tons, 000 omitted.	1910. Tons, 000 omitted.	1875. Marks, 000,000 omit'd.	1910. Marks, 000,000 omit'd.
Cotton.—Imports	154	471	203	651
Exports	39	90	52	97
Consumption	114	383	151	504
Wool. — Imports	59	232	218	492
Exports	20	45	73	117
Consumption	39	187	145	385
Jute. — Imports	9	129	4	42
Exports	...	6	...	2
Consumption	9	123	4	40
Silk. — Imports	3.8	10	117	83
Exports	1.2	2.5	39	19
Consumption	2.6	7.5	78	64
Flax. — Imports	86	122	69	83
Exports	49	37	40	19
Consumption	37	85	29	64

Germany imports not only raw textile materials, but also yarns, and these in increasing amounts. The textile industry of the country is not, thus, a ruling market factor either in quantity nor quality of goods. In 1910, taking all kinds of yarn, imports amounted to 67,663 tons valued at 250 million marks, exports to 32,132 tons valued at 144 million marks, and consumption to 35,000 tons valued at 110 million marks. For cotton, the average annual imports for the years 1907-1909 were 26,000 tons; for wool, 21,500 tons. The average annual exports of cotton for the same period were 6,450 tons, as against 9,700 tons of wool. The German consumption of foreign cotton yarns is, annually, 19,550 tons valued at 76 million marks, of foreign wool 11,800 tons valued at 48 million marks, and of foreign flax 8,075 tons valued at 20 million marks. The principal importer is England, which imported, in 1910, cotton and woolen yarns to a value of 190 million marks; then comes Belgium (wool and flax), France (wool), Austria-Hungary (wool and flax), and Switzerland (wool). Germany exports to England, Austria-Hungary, Russia, Sweden, Switzerland, Japan, Egypt, Italy, Holland, British India, China and Bulgaria. As regards woven products of all kinds, the following figures are interesting:

	Quantities (Tons). 1875.	Quantities (Tons). 1910.	Value. (Millions of Marks). 1875.	Value. (Millions of Marks). 1910.
Imports	26,659	19,091	177	150
Exports	33,900	112,125	315	837
Excess of exports	7,211	93,036	137	687

Thus it appears that Germany is exporting increasing quantities of cloths and manufactured products. Cotton goods account for over half of such exports, amounting in 1910 to 60,421 tons, against imports of 10,394 tons. The quantity has increased sixfold since 1869, while the value has increased fourfold. From 62 million marks, the value of cotton goods exported has jumped to 308 millions (being 40 per cent of the value of all textile goods). The amount of woolens exported has increased in the same period from 9,400 to 33,059 tons, while imports have declined from 7,500 to 3,768 tons. The value of exports has increased from 142 million marks in 1879 to 263 million in 1910. From 1859 to 1910, exports of manufactured silks have increased from 1,410 to 10,489 tons* (sevenfold), but their value has fallen from 200 million marks in 1889 to 183 millions in 1910. The vicissitudes of the linen industry are considerable, and this branch of the textile trade plays a very modest rôle in Germany as compared with the others.

The countries from which Germany gets its supply of manufactured goods are England (cotton and wool; value, 64 million marks), France (silk; value, 30 millions), Switzerland (value, 18 millions); Austria-Hungary (value, 7.5 millions), and Japan (value 5.7 millions). More than sixty countries purchase partly manufactured and finished textile goods from Germany. The value of exports to some of the leading purchasers was, in 1910: England, 201 million marks; United States, 110 millions; Switzerland, 42 millions; Holland, 39 millions; Argentina, 34 millions; France, 32 millions; Italy, 30 millions; Austria, 27 millions; Russia, 24 millions; Denmark, 22 milions; Sweden, 21 millions; Turkey, 21 millions; Brazil, 17 millions; Belgium, 17 millions; British India, 16 millions; Norway, 11 millions; Rumania, 11 millions.

According to M. Oppel, in 1910 the commercial movement of the different classes of textile goods was, in amount and value, as follows:

	Imports — Amount. Tons.	Imports — Value. Marks.	Exports — Amount. Tons.	Exports — Value. Marks.
Raw materials	945,000	1,436,000,000	181,000	279,000,000
Yarns	69,000	259,000,000	37,000	143,000,000
Manufactured products	19,000	150,000,000	112,000	838,000,000
Totals	1,053,000	1,839,000,000	330,000	1,260,000,000

Thus total imports and exports of textile goods in 1910 amounted to 1,384,000 tons, valued at 3,100 million marks, 41 per cent of which was cotton goods, 36 per cent wool, 16 per cent silk, and 7 per cent flax, hemp, and jute.‡ The excess of imports over exports of raw materials was 784,215 tons or 1,156 million marks, and of yarns 32,334 tons or 109 million marks. On the other hand, manufactured products showed an excess of exports of 93,000 tons, valued at 687 million marks. The net balance was, therefore, 579 million marks, in favor of other countries.

As regards finished articles of dress, Germany exported these valued at 65 million marks in 1898, 121 million marks in 1902, 103 millions in 1910, 112 millions in 1911, 118 millions in 1912, and 132 millions in 1913.

German statistics give no exact information concerning the movement of merchandise by land and by sea. If a distinction would be made between imports by land and imports through the ports, it is necessary to consult the statistics of the different maritime localities. In order of importance, from the point of view

‡In 1913, Germany imported yarns and manufactured textile articles to a total of 451 million marks, exports being valued at 1,293 million marks.

of transactions relative to the textile industry, first place must be given to Bremen (where a regular cotton market is carried on, similar to that at Liverpool), followed by Hamburg which imports cotton and wool, Koenigsberg (flax from Russia), Danzig and Lubeck. In 1910, imports and exports of textile products at Bremen amounted to 876 and 907 million marks, respectively; at Hamburg, to 939 and 752 million marks, respectively. Geographically speaking, Germany is perhaps less favorably situated than its competitors,—England, the United States and France. England has the benefit of an industry old in experience and years, the trade centres of which are within easy reach of the import points; the industry is firmly established and well concentrated, with supplies of oil and iron close at hand; and when it becomes a question of exporting, the English mills are in the same vicinity with the shipping ports. The humidity of the climate is favorable to spinning. The United States has the tremendous advantage of being the largest producer of raw cotton and of being able to procure within the boundaries of the country the greater part of its supply of wool. France has incontestible advantages; it has a large port on the Mediterranean, whereas Germany has no outlet on and is far distant from this ocean. The consumption of cotton in Germany has increased from 0.3 kilograms in 1840, to 7.6 kilograms in 1912. The German cotton mills, in which an eighth of all textile workers of the Empire are employed and which are subject to the fluctuations of the cotton market and American "corners," are anxious to diminish the prominence of the United States as the centre of the world's production of raw cotton. But this is scarcely probable: out of a world's cotton production of about 27 million bales, the United States produces 14 to 15 million, India 4.4 million, China 2.3 million, and Egypt 1 million bales. Russia keeps for its own consumption what it produces or purchases in Central Asia. Fifteen years ago Germany first began the experiment of developing independent sources of supply. The Colonial Economic Committee, under the inspiration of Professor Warbourg and Professor Woltmann, lent its efforts to this end. After the appointment of M. Dernburg as head of the colonial department, the cotton problem was given practical study. In 1911, a position of financial advisor on agriculture was created in the colonial department. It was filled by M. Busse, who instituted a whole series of experiment stations. In 1912, the German consumption exceeded 2 million bales, valued at 580 million marks. The production of German East Africa was 9,370 bales, valued at 3.3 million marks. In the Indies the prospects are more encouraging. Cotton cultivation is an industry of great antiquity there, going back to 350 years before the birth of Christ. During the Civil War in the United States, the value of exports of cotton from the Indies jumped from 82 million marks in 1859 to 717 millions in 1863, and 751 millions in 1864. After peace was declared in America, prices fell off, but the demand for cotton continued.

In 1912, there was imported into Germany raw cotton to a value of 535 million marks, while exports amounted to 54 million marks. Germany imports from 15 to 20 per cent of the Indian crop. In 1912 cotton imports from India were 38,385 tons (value, 39,153,000 marks), from Egypt 41,000 tons (value, 69,500,000 marks), and from the United States 422,310 tons. The principle re-exports of cotton were to Austria-Hungary (25,000 tons) and to Russia (9,863 tons). Cotton was also exported from Germany to Sweden, Switzerland, Italy, Holland, and Belgium.

There was exported from German East Africa, in 1912, 18,816 quintals* of cotton, valued at 2,110,000 marks, and from Togo 5,509 quintals, valued at 515,000 marks. In 1912, 12,941 hectares† in German East Africa were planted in cotton by Europeans, against 6,144 hectares in 1909. The military expeditions, which had to be made in 1905 and 1906 to subdue the rebellious natives, retarded the development of the production. Up to the present, the results obtained have not been considerable. The development of the railway system will, perhaps, facilitate the extension of agriculture.

EX-PRESIDENT TAFT ON THE MEANING AND INTERPRETATION OF THE NEW ANTI-TRUST LEGISLATION

At the first day's session of the Annual Meeting of the American Bar Association, on Tuesday of the present week, at Washington, D. C., the President of the Association, William Howard Taft, ex-President of the United States, devoted the greater part of his address to the discussion of the true meaning, in the light of the tradition of the law, and to the probable practical interpretation and application, of the two considerable measures enacted by the present Congress for the purpose of amplifying and making more determinate the provisions of the Sherman Anti-Trust Act, viz., the Trade Commission Act and the so-called Clayton Act. Because of the distraction of the public mind due to the European War, these new laws have received remarkably little attention since their passage; but, as they are expected by President Wilson and the leaders of the Democratic Party to affect profoundly the entire conduct of business in the United States, all competent attempts to elucidate them and to forecast their effects, wether legal or practical, are important for thinking men of affairs. Consequently, the essential portions of Mr. Taft's discourse, in so far as this dealt directly with the two measures in question, are here given.

* * *

The most noteworthy national legislation of the year, from the standpoint of the administration of justice, is contained in the Trade Commission Act and the so-called Clayton Act. Together they affect two general subjects matter. They supplement existing statutes and general law as to illegal trusts and monopolies in interstate commerce, and they deal with the application of the Anti-Trust Act to labor associations, the issuing of injunctions in labor disputes in Federal courts, and the procedure for the punishment of contempts in a certain class of cases.

Both measures in the most painstaking way make clear that nothing in them is to vary the meaning of the two important sections of the Sherman Act, which have been so fully considered and clearly construed by the Supreme Court in the light of, and by the rule of, reason. We may, therefore, in beginning the consideration of this new legislation, rejoice that in spite of the exuberant criticism of the Supreme Court decisions in the Standard Oil and Tobacco cases when announced, and the threats of legislation to dethrone reason in judicial construction as applied to trust law, we may still use in a normal way those mental processes with which nature has endowed us in attempting to find out what Congress means in these acts.

[Here follows in Mr. Taft's address a discussion in detail of the specific provisions of the two measures.]

The first new term that confronts us in the Trade Commission Act is unfair competition. What does it means? It does not appear in the Clayton Act at all, and yet the two acts are *in pari materia*.

It is hard to reach any other conclusion, after consideration of the old legislation and the new, than that unfair competition only

*Quintal equals 220.5 pounds. †Hectare equals 2.47 acres.

includes those methods and practices in interstate trade, the effect and intent of which would bring them within the scope and condemnation of the second and third sections of the Sherman Act. The same thing is true of several specific offenses denounced in the Clayton Act. These are: (1) Discrimination in price in sales of goods; (2) a sale or lease of goods patented or unpatented on condition that the vendee shall not deal in or use the goods of a competitor; (3) acquisition of stock by one corporation in another; (4) acquisition of stock by one corporation in two other corporations, when the effect of any one of these four acts may be substantially to lessen competition, restrain interstate commerce, or tend to create monopoly.

The words "with the effect substantially to lessen competition" are to be construed in the light of their association with the words that follow them, in order to secure some guide to the meaning of "substantially." It certainly does not mean any lessening of competition, however small, because its ordinary signification prevents that. More than that, the union of two corporations by a holding company or otherwise must always lessen competition somewhat The only reasonable solution would seem to be to hold that it means such substantial suppression of competition as to constitute a real restraint of trade and a tendency to monopolize.

Now it is possible to point out specific decisions of the Supreme Court on the anti-trust law in which just such acts as are here denounced are held to be within the Sherman Law. The so-called tying provision in the sale of patented articles, as to which the Supreme Court divided, may be an exception. But with this exception, so far as I can see, the field of illegal and criminal effort in respect to restraints of interstate commerce or monopolies of it is not enlarged under the new acts, and indeed it is difficult to see how it could be, under the sweeping language of Chief Justice White in construing the Sherman Law in the Standard Oil and Tobacco cases.

The new laws only specify certain phases of violations of the Sherman Law which can be prosecuted under separate indictments, and in many respects are only declaratory of existing law. Thus one section of the Clayton Act provides that if a corporation shall violate the law, any director, officer or agent authorizing such violation shall also be deemed guilty of misdemeanor and punished by fine and imprisonment. This section is intended to carry out the famous policy, advanced as a new departure, that guilt is personal.

It is certainly a wise provision; but it can hardly be called a new one, for it has always been the law since there were crimes at the common law and rules punishing aiders and abettors. The section suggests that line of Holmes to the "Katydid": "Thou sayest an undisputed thing in such a solemn way."

The analogy between the functions of the Commerce Commission and the Trade Commission is not complete. The consideration of the question of unreasonableness and undue discrimination as to rates would seem to vest in the Commerce Commission a much wider discretion and range of judgment, free from examination and review by the courts, than the Trade Commission has in finding the facts and making the restraining order as to "unfair competition."

In the former case the Commerce Commission is not only finding the facts but is exercising in detail the legislative function of Congress of rate regulation, which, with general limitations, has to be delegated to it in order that it can be effectively exercised at all. All that the court does in review of action by the Commerce Commission is to see that it is within the scope and limitations of the general delegation of power and that it does not deprive the carrier of his property and its use without due process of the law, i. e., that it is not a confiscation. The function of the Trade Commission is to find the facts also, but when it comes to decide the question of unfair competitio upon these facts it would seem to be, as I have before said, only a question of law under the Sherman Act. * * *

The Trade Commission, therefore, is merely to apply the law to the facts as a Master in Chancery would do. This is to use the very analogy by which the duties of the Trade Commission under another section are described. So, when the court comes to consider the Trade Commission's action on review, it takes its findings and order and treats them as it would the report of a Master in Chancery, with the exception that it cannot re-examine a finding of fact unless there is no legal evidence to suport it. It may remand the case for additional evidence for further finding and report.

Proper equity practice requires that the Chancellor should not set aside the finding of a Master on the facts, unless plainly contrary to the weight of the evidence. The difference between this and treating the finding of fact as conclusive, so far as I can see, is the only difference between the function of the court in dealing with the Trade Commission's order and that which it performs in dealing with the report of its Master in Chancery as to the facts and the proper order or decree to be entered upon them in an equity cause.

It is not germane to my purpose to discuss the effect of the prohibition of interlocking directorates and the denunciation as Federal crimes of breaches of trust of those having control of interstate commerce carriers, except to say that the inconvenience they may cause to law-abiding business men of scrupulous honesty will be much more than offset by the substantial good they will do in protection of the public from illegal combinations, and in the protection of confiding stockholders from being plundered. * * *

In the last quarter of a century we have witnessed the enormous growth of power in bodies of men, secured by the combinations of capital on the one hand and of labor on the other. The necessity for the combination of capital, in order to increase the effectiveness of production and manufacture, and to reduce its cost, has been fully recognized by all persons at all familiar with business conditions and economic principles. The equal necessity for the combination of labor, in order to exact from capital its fair share of the value of the joint product, consistent with the normal operation of economic law, has also been recognized by sane students of economic and social science. The enormous power which these combinations give has proved to be subject to great abuses.

The combinations of capital too frequently strengthened their control by the use of money in politics and through the instrumentality of the political boss and the machine. After the country had sobered down from the intoxication of its enormous business expansion and prosperity, the scales fell from the eyes of the people, they saw the danger of plutocracy, and throughout the length and breadth of the land they attempted, by their representatives in the Legislatures and in Congress, to curb this power of combined capital and to restrain it within legitimate limits; and so we had the interstate commerce law, the anti-trust laws, and the amendments to those laws, and the struggle in the courts until now both laws have received authoritative construction and have become reasonably effective for the purpose for which they were enacted.

But the momentum that such a popular movement acquires prevents its stopping at the median line, and we are in danger of excessive regulation which will really interfere with that freedom of trade and unrestricted initiative which has helped so much the material progress of the country heretofore. Party leaders and parties, in the imaginative and efflorescent style of party platforms and stump deliverences, have denounced the slow judicial process of remedying evils and establishing justice, and have called for cross-cut methods, direct and summary remedies, and the sup-

pression of evil and the upholding of the good by executive action in which those acting were not to be bothered by precedent but were to decide everything upon the merits of the particular case. Legislatures have sought to meet this demand by creating commissions with large powers to enforce laws.

In so far as these commissions have rendered more effective the exercise of what is really an executive function, they have been good things, and often they have relieved the courts of quasi-executive duties that have not only burdened the courts, but also exposed them to unnecessary prejudice and attack, because the matters acted on had a political, economic, or social phase. Many have been disposed to view this delegation of powers to commissions as derogating from the authority of courts and as depriving the citizen of a real judicial hearing in defense of his right to life, liberty, and property and the pursuit of happiness. Whatever the early effect, I do not think we need fear such an ultimate result. The natural spirit engendered in every one who has blended with all his conceptions of social and political life the principles of Anglo-Saxon justice will prompt limitations in such legislative enactments and rules of practice in their execution and preserve the same due process of law for the party litigant that the barons of Runnymede wrested from King John for the freedom of England.

The Court of Chancery was evolved from the wide, unlimited and apparently arbitrary discretion that the King vested in his Chancellor to remedy individual instances of injustice done by the King's own courts of common law. The natural conservative tendency, even of radical reformers, when confronted with the difficult duty of drafting practical legislation is well illustrated in the provisions of these two statutes which are far less drastic and revolutionary than we had been led to expect when there was so much "thundering in the index."

While the abuses of combinations of capital have properly aroused public alarm and evoked the most stringent laws to suppress them, the abuses growing out of the enormous power of combinations of labor, which have been also manifest, have not evoked the same regulative legislative tendency.

The labor provisions of the new legislation (of the sitting Congress) are, first, a declaration of the legality of labor, agricultural, and horticultural associations for mutual help and without profit, and a protection of them in lawfully pursuing their legitimate objects. This is plainly declaratory, and does not change or affect existing law.

The procedure prescribed as to the issuing of preliminary restraining orders without notice and of preliminary injunctions in Federal courts is admirable. It is in accordance with the best equity practice, and will doubtless tend to prevent any ill-advised orders without notice and hearing.

THE POSITION OF THE FOREIGN BANKS

IT has been impossible to obtain full and reliable figures regarding the position of the foreign banks since the outbreak of the European War. The Bank of England has issued regular statements, but the Bank of France and the Imperial Bank of Germany have not done so. The following statement issued by the National City Bank is of interest in recording the underlying conditions:

"The Bank of England's position had been improving before the outbreak, its metallic reserve having increased from 44½ per cent on May 13 to 52⅜ per cent on July 22. About the latter date the *pour parlers* over the Servian situation began to offset it unfavorably and on July 29 the reserve had fallen to 40 per cent and the bank rate was raised from 3 to 4 per cent. On July 31 war was declared and the bank rate was immediately raised to 10 per cent where it remained for a day or so, and then was gradually reduced to 8, 7, 6 and 5 per cent, the rate now prevailing. Between July 29 and August 8 the reserve fell to 14¾ per cent, partly because of a loss of £11,000,000 of gold, and partly because of a rise of £15,000,000 in 'deposits' which signifies loans. This increase of 'deposits' was only the beginning of the flood; from £55,000,000 on July 22, they rose to £159,000,000 on September 30, or an increase of $520,000,000 (on October 22 they were £168,822,000). The securities naturally rose also in the same time, the figures for the two dates being £44,000,000 and £141,000,000 (on October 22 securities had fallen to £132,862,000). The Bank has been gaining gold since August 7 its stock rising from £27,000,000 to £53,000,000 on September 30 (on October 22, it reached £60,062,756). Its stock of gold on the latter date was the largest in many years, but owing to its enormous 'deposit' account the ratio to liabilities was only 22.81 per cent. The Bank of England is now presumably receiving practically all of the gold product in South Africa, Australasia, India and Canada, which totals approximately $15,000,000 per month, or 40 per cent of the world's production.

"No statement for the Bank of France is available for a date later than July 30, the publication of statements having been discontinued. Its 'discounts and advances' increased between July 23 and July 30, from $455,000,000 to $640,000,000, and the note issues from $1,180,000,000 to $1,335,000,000. The discount rate now stands at 5 per cent, the highest rate since 1870. Its holdings of gold on July 30 were $828,000,000.

"The statement of the Imperial Reichsbank is doubly interesting at this time on account of Germany's complete isolation from the rest of the world. Communication with Germany can only be had in an indirect way and through the intermediary of third parties. From July 23 to August 31 its metallic stock fell off from $424,000,000 to $409,000,000, about $20,000,000 of this being silver. Between the same dates its 'bills discounted' increased from $137,500,000 to the enormous sum of $1,187,500,000, its 'deposits' from $235,500,000 to $610,000,000, and its circulating notes from $472,500,000 to $1,058,500,000. The enormous increase in the items of liabilities indicates that the Reichsbank is pursuing the same general policy of extending credit freely as the Bank of England. The Imperial Treasury has resorted to the issue of emergency currency and notes are now in circulation of as low a denomination as 2 marks and 1 mark [mark equals 23.75 cents]."

Later figures regarding the Reichsbank indicate that the stock of gold and silver has increased from $409,000,000 on August 31, to $434,860,000 on October 1. It has been suggested that the stock of gold amounting to $60,000,000, set aside by the Government out of the French indemnity of 1872, has been turned over to the Reichsbank. Later figures on "bills discounted" and "deposits" are not available. Note circulation on October 1 reached the figure of $1,122,725,000 as against $1,058,000,000 on August 31. This is an increase of $650,225,000 over the figure of $472,500,000 recorded for July 23.

INDUSTRY, COMMERCE AND FINANCE

The Foreign Trade of the United States in September and an Analysis of the Gold Movement.—The Department of Commerce at Washington has issued figures covering the foreign trade of the United States during September. Imports reached a total value of $139,204,267 as against $129,399,496 for August, and $171,084,843 for September a year ago. Exports amounted to $156,188,790, as compared with $110,337,545 last month, and $218,240,001 for September, 1913. For the month, then, there is an excess of exports of $16,984,423, as compared with an excess of imports of $19,051,951 last month. This is the

first monthly excess of exports since last March. For the nine months there is an excess of exports of $57,972,916, as compared with an excess of exports for the corresponding period in 1913 of $405,797,087. It is noteworthy, however, that 1913 was a banner year; we need go back only as far as 1909 to find the value of exports for September below the present value; and in the case of imports, the present figure of $139,000,000 for September was never reached before 1911, when the figure went slightly above $144,000,000.

FOREIGN TRADE OF THE UNITED STATES BY MONTHS, 1914.

	Exports.	Imports.	Excess.
September	$156,188,790	$139,204,267	Exp. $16,984,423
August	110,337,545	129,389,496	Imp. 19,051,951
July	154,072,225	160,178,133	Imp. 6,095,908
June	157,110,451	157,772,973	Imp. 653,522
May	161,732,619	164,281,515	Imp. 2,548,896
April	162,552,570	173,762,114	Imp. 11,209,544
March	187,499,234	182,555,304	Exp. 4,943,930
February	173,808,468	149,937,011	Exp. 23,871,457
January	203,799,517	154,469,263	Exp. 49,330,254

There is even less ground for alarmist deductions in an examination of the figures covering the first nine months of the past ten years, as shown in the following table:

	Exports.	Imports.	Excess Exports.
1914	$1,467,538,446	$1,409,565,530	$57,972,916
1913	1,733,422,158	1,327,625,071	405,797,087
1912	1,616,024,491	1,332,894,727	283,129,764
1911	1,455,474,239	1,133,002,284	322,472,005
1910	1,222,926,758	1,172,362,409	50,564,349
1909	1,161,024,910	1,068,594,356	92,430,534
1908	1,230,767,349	798,408,168	432,269,181
1907	1,331,588,636	1,108,072,299	223,516,399
1906	1,237,834,424	948,267,117	289,567,307
1905	1,102,551,375	1,102,551,375	230,278,847

The figures for 1905 exceeded those of any preceding year. It is apparent, therefore, that the export values for the first nine months of 1914 are the greatest in our history with the exception of the years 1913 and 1912. And the import values for the nine months were the greatest ever recorded for a similar period in any year of our commercial history. Had imports remained stationary a greater excess of exports would have resulted.

The imports of gold for September reached the value of $2,761,590, as against $3,034,824 last month, and $4,626,748 in September, 1913. Exports of gold amounted to $21,867,392, as against $18,125,617 last month, and $496,037 for September, 1913. It appears from the following table that only in one other year since 1905 have exports of gold exceeded imports during September:

IMPORTS AND EXPORTS OF GOLD DURING SEPTEMBER, 1905-1914.

	Exports.	Imports.	Excess.
1914	$21,867,392	$2,761,590	Exp. $19,105,802
1913	496,037	4,626,748	Imp. 4,130,711
1912	568,302	4,200,682	Imp. 3,632,380
1911	2,372,861	4,704,096	Imp. 2,351,235
1910	1,822,476	3,192,341	Imp. 1,369,865
1909	7,545,442	2,351,158	Exp. 5,195,284
1908	3,774,391	4,767,051	Imp. 792,660
1907	1,503,936	2,759,017	Imp. 1,255,183
1906	2,278,522	31,431,038	Imp. 29,152,116
1905	1,112,701	5,243,062	Imp. 4,130,738

On the other hand, the next table shows that since 1905, in every year except two there has been an excess of exports of gold over imports at the close of the first nine months of the year. However, the excess this year sets a new high record.

IMPORTS AND EXPORTS OF GOLD FIRST NINE MONTHS, 1905-1914.

	Exports.	Imports.	Excess.
1914	$117,656,778	$3,841,946	Exp. $117,714,832
1913	31,079,467	3,209,608	Exp. 27,870,671
1912	42,778,271	38,789,843	Exp. 4,038,431
1911	41,263,210	15,117,106	Imp. 26,013,736
1910	55,318,781	45,682,127	Exp. 9,635,954
1909	96,972,834	31,105,373	Exp. 66,167,441
1908	88,837,280	58,327,973	Exp. 30,509,407
1907	41,307,913	30,562,220	Exp. 10,017,543
1906	35,189,102	111,776,017	Imp. 75,986,055
1905	42,577,921	30,339,602	Exp. 12,338,319

A vivid conception of the actual extent of the gold movement may best be arrived at by going back over a number of years. The total value of gold exported for the first nine months of 1914 was $157,656,778. Going back to 1820 the Government records show that gold exports for a full year exceeded $100,000,000 first in 1864. Nothing approaching this amount was reached again until 1893, when gold valued at over $108,000,000 was exported. In 1896, there was an exportation amounting to more than $112,000,000 and in 1910, the highest previous mark was reached with $118,563,215. It appears, therefore, that the gold exportation for the first nine months of 1914 exceeds the export total of any previous full year by $39,093,563. The gold import figures present nothing out of the ordinary.

To review the net result of the gold movement during the past ten years the following table is compiled from the Statistical Abstract of the United States:

EXCESS OF IMPORTS OR EXPORTS OF GOLD, 1904-1913.

	Excess of			Excess of	
	Imports.	Exports.		Imports.	Exports.
1904	$17,595,382	.....	1909	.....	$47,527,829
1905	.....	$38,945,063	1910	.....	75,223,310
1906	57,648,130	.....	1911	$51,097,360	.....
1907	63,111,073	.....	1912	.....	8,391,848
1908	75,904,397	.....	1913	.....	8,568,597

This table indicates that of the past ten years there have been five in which gold imports exceeded exports and five in which exports exceeded imports. The average excess of imports was $53,071,270 a year, and the average annual excess of exports only $35,731,329. It is already evident that for the year 1914 the exports of gold will largely exceed the imports.

World's Wheat Production in 1914.—A statement issued on October 17, by the Bureau of Statistics, United States Department of Agriculture, estimates the world's production of wheat for the year 1914 at 3,741,013,000 bushels, as compared with 4,125,310,000 bushels in 1913 and 3,791,875,000 bushels in 1912. Hence, despite the record-breaking yield of 892,000,000 bushels estimated for the United States, the total wheat crop of the world appears likely to turn out smaller for 1914 than for either of the two previous years. It is of interest to see how the decrease of production has come about. In Europe only three countries appear to have had really good wheat crops in 1914. England yielded about 6,000,000 bushels more than in 1913, while France and Spain had somewhat better crops. But the indications with regard to the crop in European and Asiatic Russia are for no less a decrease from the unusually good crop of 1913, than 183,000,000 bushels. Italy's crop was short and so was Hungary's. Rumania and the Balkan States also appear to have fallen behind their recent average crop. Authoritative figures are not available for Germany and Austria, but it is believed that the crop of each of these countries this year was less than in the two previous years. Taking the European countries for which official figures have been issued,—Great Britain, Italy, Spain, Hungary and Russia,—there is found to be in them a decrease of production of 237,000,000 bushels in 1914, as compared with 1913, though an increase of 34,000,000 bushels, as compared with 1912. The figures for the European countries not yet reporting are expected to increase the deficiency for 1914. The five non-European wheat producing countries,—United States, Canada, Argentina, British India and Australia,—which grows all the wheat produced outside of Europe, excepting some two to three hundred bushels annually, officially report an aggregate production for 1914 of 1,586,606,000 bushels, or 60,000,000 bushels less than for 1913, though 20,000,000 bushels more than for 1912. This decrease was due to crop shortages in Can-

INSURANCE

Articles on the Theory, Practice and Experience of Insurance.

NOT for a century has there been such confusion in marine insurance as exists to-day. And regular ocean-borne commerce, which of course is absolutely dependent upon marine insurance, is in consequence almost entirely suspended, except for voyages between the United States and the allied belligerent countries of Europe. The effects of this enforced suspension of international commerce are being severely felt in a large number of the most important countries in the world. The United States, for example, though not engaged in the European War, is suffering from a congestion of commodities produced in large part for export. The plight of American cotton growers on this account is too well known to require comment. The marine underwriters are wholly willing to lend their assistance in this hard situation, but they are totally at a loss to find a calculable method of estimating the risks they must assume. As it becomes more and more apparent that England and her Allies have definitely planned to make the war against Germany and Austria quite as much one of financial and economic exhaustion, as one fought out desperately upon fields of battle, marine insurers perceive more clearly the uncertainties attaching to vessels and cargoes destined to other ports than those of the Allies themselves. The lists of commodities which appear as contraband, conditional contraband and non-contraband in the Declaration of London have ceased to be regarded as reliable guides in the matter of what English and French vessels of war will seize and detain, and of what they will not. Neither England nor France is a signatory of the Declaration of London, and the Government of either country may make up its mind overnight that it is necessary to success in the war, as planned, that articles should be moved from one list into another. In such case neither insurer nor insured can have any certainty that a ship and cargo already at sea will not be treated as subject to seizure, despite the fact that when the voyage was begun the rules seemed to make both safe. Then there is always the possibility that some part of the cargo may be proved to be owned by a German or Austrian subject, or that it has been indirectly sold or consigned to parties domiciled in Germany or Austria. The ever increasing pressure upon the governments and citizens of these countries to procure indispensable commodities from neutral countries, and the complex and ingenious devices resorted to for the purpose of concealing the true ownership and destination of such commodities, introduce here an element of indeterminable hazard. With the Allies watching eagle-eyed all shipments to neutral countries, which might conceivably be intended for reshipment or resale to Germany or Austria, and resolving all doubts in their own favor by seizing the ship first and deciding upon the question of the propriety of the seizure afterwards, the mere fact that the ship is neutral and bound for a neutral port, and the cargo consigned to neutrals, appears a slender reed to rest on.

None the less, up to the present week the almost complete control of the seas by English and French war vessels, by their domination of the Western Seas, had made it not impossible to obtain war-risk insurance at rates not absolutely prohibitive to shippers. Provided they would warrant the property insured not to be shipped, consigned and/or sold to a German or Austrian subject and not intended for consignment to Germany and/or Austria, either directly or indirectly, shippers could obtain policies on shipments to neutral European countries, even those bordering on Germany and Austria, with relative ease,—exception being made, of course, of the confused period immediately following the outbreak of the war. But early this week the British Government informed all English marine underwriters, whether companies or Lloyds, that they must no longer insure property at sea against capture, seizure or detention by the British Government or their Allies. It is to be assumed that similar instructions have been given by the French and Russian Governments to the marine insurers that are their subjects. Inasmuch as the German and Austrian marine companies and underwriters are virtually precluded, in the present posture of the war, from doing any business at all, the practical effect of this governmental action has been to make it impossible for shippers to obtain absolute war-risk protection, except from the relatively few marine companies in the United States and the still fewer companies in non-European countries; and all these companies, according to the best information, have concluded that they will impose the same restrictions upon their policies as do the British and French companies and Lloyds, London. Hence American shippers, for example, can now obtain virtually no war-risk insurance at all from private underwriters except on goods in English, French or Russian bottoms and destined for the ports of those countries or their dependencies. Plunging rates for voyages to other ports are heard of in the market, as offered from obscure sources; but these rates are commercially prohibitive and are probably meant to be so.

It might appear that relief could be obtained from the governmental war-risk bureaus which have been established in this and other countries. According to an announcement just made by the United States Department of Commerce, no less than eleven of these bureaus have now been established,—in Belgium, Denmark, France, Germany, Greece, Great Britain, Italy, Japan, Norway, Sweden and the United States. But, to begin with, these governmental bureaus are far less of a force in assisting commerce than is generally supposed. Leaving aside the fact that the German institution is at present unable to do anything, the scope of the operations of the others is restricted to insurances upon vessels flying the flags of the respective countries that established them. Only the English, the French and perhaps the Norwegian and Italian bureaus really have any field in which to work. The American bureau, for example, had up to the end of last week issued war-risk insurance only upon about $10,000,000 worth of goods and vessels, a mere bagatelle in our foreign commerce for three months, even in war times like the present. Moreover, this is not the whole story. There is every reason to think that the freedom of action of these governmental institutions is severely hampered by the possibilities of political complications. Will the American bureau, for instance, follow the lead of the private underwriters since the pronunciamento of the British Government on the subject, and compel all its insured to warrant their goods free from any claim arising from capture, seizure or detention by the British Government or their Allies? So far as is known, it has been impossible as yet to elicit information on this point from Washington. It would, however, appear a strange thing in the eyes of the American people, if the Government of the United States, undertaking to insure the war-risk on non-contraband goods shipped in American bottoms to neutral ports, should decline to afford protection against capture, seizure or detention by the British Government or their Allies, compelling American shippers to bear this risk themselves. What alarming possibilities, on the other hand, are opened up, if our Government itself, *qua* insurer, is compelled to meet claims arising from such captures, seizures and detentions? It is perhaps the perception of the awkwardness of this situation that keeps our governmental war-risk bureau so indecisive. Meantime, our shippers, many of whom have contracts to fulfil in neutral foreign countries, are well-nigh distraught.

INSURANCE AGAINST LOSS OF PROFITS THROUGH FIRE

By Ernest W. Bell*

GENTLEMEN:—When your president invited me to give this lecture I responded with alacrity, and no doubt a little thoughtlessly, forgetting that the subject is an intricate and most difficult one to handle on account of it being an innovation in our insurance circles. However, having a knowledge of accountancy and some experience in adjusting profit losses, I have endeavored in the lecture to give you my views as clearly as possible, and I trust that any objections made by me will be taken in good spirit by the lecturer, and that the members in the discussion to follow will town more upon these suggestions than upon the general outline of profit policies.

"Profits Policies," or in other words, "Consequential Loss Policies," originated from a policy issued in England many years back, and known as a "Profits" or "Excess Fire" policy. This form of insurance was a simple one and the method of adjustment equally so. The policies now in vogue contain the same principles altered and amended by the underwriters in accordance with existing circumstances and experience learned from losses. This profits policy is still in existence on the Continent of Europe and is known as Chomage Insurance. The wording ran:

"To pay the percentage that the sum hereby insured bears to the total fire insurance over contents on the amount paid by the fire companies."

Example:

Insurance	£400
Total fire insurance over contents	8,000
Percentage of the sum insured to total of fire policies 5 per cent.	
The companies pay under the fire policies	6,000
Insured is enabled to recover under his excess fire policy 5 per cent of £6,000, namely	300

Under this contract the insured is paid the proportion irrespective of the loss of profits, and there is no doubt that the method of adjustment considerably increased the moral hazard.

In the United States a scheme for insuring loss of profits was called "Use and Occupancy." This policy contracted to pay a pro rata amount of the sum insured for each day's stoppage of business and a proportion if only partially interrupted. Given a fixed turnover this would be workable, but under fluctuating turnover, of little use to the commercial world.

A fire policy [illegible] the insured for his loss on buildings, stocks, machinery and such like which is termed "material loss," but it does not cover the merchant's earning profit to which he is entitled. Although he sustains by material loss the business has been [illegible] during a number of years received from [illegible] income called "net profit," there is [illegible] the consequent loss from a commercial and [illegible] to be able to shoulder a company with the payment of a [illegible] premium. This is called the "Earning [illegible] to the "material loss" the assessment of [illegible] easily, the loss is [illegible] and [illegible] can be furnished with reasonable [illegible] Then [illegible] circumstances such as [illegible] the [illegible] to the latter, [illegible] specialties [illegible] by [illegible] commissioner has to [illegible] with [illegible] after the [illegible] has [illegible] the [illegible] to [illegible] ascertain what loss [illegible] the cessation [illegible]

Principal causes of fluctuation of turnover and alteration of earning loss:

Seasons: The late advent of a Summer or early Winter will cause a serious drop in the turnover of clothing, mantle or blouse and skirt manufacturers.

Labor: Labor conditions will be so disastrous to a manufacturer that although for years he had received a good revenue from his business, he finds the additional cost of manufacture changes his profit to a loss. There are also many other causes too numerous to mention.

There is no doubt that the issue to a merchant of a profits policy is all that can be desired from his point of view. He now stands to lose absolutely nothing. The material loss is covered and his earning loss is covered—truly a position of security which the insured can contemplate with satisfaction, but the greater the security to the insured the more danger to the underwriter, if the moral hazard is not as it should be.

Mr. A. B. Wright, in his lecture (1910) to the Liverpool Institute states: "It may be safely taken that profits insurance does not increase the moral hazard." I do not agree with this, as from my knowledge of same attached to the "material loss," I am certain that such risk is considerably increased by the issue of the profits policy; further, it appears to me that the issuing of the profits policy is a material fact which the underwriter of the fire policy should have disclosed to him, whether it be taken out at time of proposal for fire insurance or during the currency of the contract.

The question of the advisability of issuing a policy on loss of profits is a very serious one, and in England, where it originated, commercial life is vastly different to that of our State. The same can be said of the moral tone, and I feel that it is hardly possible for the underwriters of Australia to carry out the issue of these policies on the same basis as in England. It is natural that the moral hazard in England is better security than that of our State. Businesses do not spring up like mushrooms in any of the English towns. Probably 99 per cent of the firms who carry profits policies in England have been in existence for fifty or one hundred years, and their trade is very regular. The underwriter there can go back seven or ten years and ascertain that the net profits for the period average very much the same. Again, credit is not so extensively given there as here, a delicate point to speak upon, but having a detrimental effect to moral hazard. Turning to New South Wales we find every week new industries and trading firms starting, and there is no doubt that this is a large factor in the element of the risk. Policies are issued to firms that have been in existence only a year or so, not long enough to know whether they have a net profit or a net loss. The issue of policies to such firms is suicidal. Our climatic conditions and our labor strikes are also liable to increase the moral hazard. In short, the structural hazard, or mere figures of the business will give the underwriter little worry, but the moral hazard requires the closest scrutiny. The following is, of course, only my opinion:

(1) That only firms of the highest moral standing should be accepted.

(2) That no policy should be issued in the nature of loss of profit to a firm that has not been in existence five years.

(3) That the insurance should be based on the average total earnings or profits for the three years previous to the application.

(4) That as regards retailers it should be confined to capital cities, as the nature of country business is too precarious owing to fluctuating seasons and long credit.

(5) That the policy issued should be reviewed on renewal,

* A paper read before the Insurance Institute of New South Wales, June, 1914.

The policy insures against loss under three headings, viz.: Standing charges, net profits, and increased cost of working. Either Nos. 1 or 2 can be deleted from the policy if required. The standing charges are enumerated in the application form.

The sum insured is calculated upon the amount of net profit for the last financial year plus standing charges, and is termed "total profits," but if the net profit plus standing charges paid or to be paid after the fire is less than the insurance, the percentage is proportionately reduced.

The policy can be taken out for whatever period the insured desires from six to twelve months, but is based upon twelve months total profits. The contract first issued read:

(a) "That the company will pay to the insured monthly for the period insured after a fire, the percentage that the sum hereby insured bears to the turnover for the last financial year, on the shortage between the turnover in each of such months, and the turnover for the corresponding months of the preceding year."

In a later policy it is altered thus:

"Monthly during the period of indemnity the loss of profits sustained in consequence of such interruption or interference but not exceeding the ascertained percentage (as defined below), etc."

Definition of ascertained percentage:

The percentage of the sum insured to the turnover for the twelve months immediately preceding the fire, but not exceeding the percentage of the profits in the last financial year preceding the fire to the turnover for that period.

The accountant in arriving at the loss under these headings finds a surprising difference in the percentage.

The formulas are:

$$\% = \frac{\text{Sum assured—}}{\text{Turnover for the last financial year.}} \quad \text{On shortage.}$$

$$\% = \frac{\text{Sum assured—}}{\text{Turnover for twelve months preceding fire.}} \quad \text{On shortage.}$$

Example worked out on each formula (occurred):

A manufacturing company whose financial year ended December 31, 1912, insured against loss of profits for £5,000.

A fire took place on August 30, 1913.

The accountant certifies that net profit and standing charges for the last financial year are not less than the amount of insurance.

That the standing charges continue to be paid or payable after the fire.

That the turnover for the last financial year was £25,000.

That the percentage of the insurance to the turnover for the last financial year is 20 per cent.

Turnover for the twelve months immediately preceding the fire:

	Before Fire.	After Fire.	Shortage.
	1912.	1913.	
September	£3,000	nil.	£3,000
October	2,000	nil.	2,000
November	2,000	£500	1,500
December	3,500	1,500	2,000
	1913.	1914.	
January	£2,000	£1,800	£200
February	3,000	3,200	
March	2,000	Total shortage	£8,700
April	2,000	....	....
May	2,000	....	....
June	2,500	....	....
July	2,500	....	....
August	3,500	....	....
	£30,000		

20 per cent on £8,700 equals..... £1,740

The same figures adapted to second formula:

The percentage of the sum insured to turnover for the twelve months preceding the fire is:

$$\frac{£5,000}{£30,000} = 16.66 \text{ per cent.}$$

16.66 per cent on ascertained shortage of £8,700 is £1,450.

So that using the last financial year as a base instead of the twelve months immediately preceding the fire, gives the insured an additional sum of £290, which he is not entitled to on an equitable basis, and yet some of the policies still embody the former wording.

The company will pay to the insured the increased cost of working necessitated by continuing the business during the interruption or interference caused by the fire. There is, of course, the usual proviso that the company cannot pay on account of a loss under all headings a sum in excess of that which would have become payable by the company if the business had been completely stopped, nor a sum greater than the whole of the sum insured. A clause is inserted also that any loss under a policy shall be adjusted by a professional accountant mutually appointed by the company and insured, or if unable to agree, such professional accountant shall be nominated by the president of the Public Accountant's Association. Some of the policies issued have a different wording to this, but the principle is the same.

Adjustment.—I give an example of an ordinary adjustment taken on plain lines as a policy states, although there is no doubt it is understood by all.

Sum insured	£7,000
On net profits and the following standing charges, interest on debentures, rent, rates and taxes, salaries to permanent staff, directors' fees, agents' fees and insurance premiums.	
The period for which the company is liable for loss after each fire is limited to six months.	
The fire occurred on November 1.	
The assessor certifies—	
That the net profits, plus standing charges for the financial year, is not less than the sum insured.	
That the turnover for the year preceding the fire is.....	70,000
That the percentage of the sum insured to the turnover is.....	10%

That the standing charges enumerated have not ceased to be paid or payable after the fire.

	Turnover for the Corresponding Month in Year Preceding Fire.	Monthly Turnover After Fire.	Decrease in Turnover.	Ascertained Percentage.	Monthly Loss or Shortage.
November	£10,000	.....	£10,000	10%	£1,000
December	19,000	.....	19,000	10	1,900
January	7,000	£1,000	6,000	10	600
February	5,000	3,000	2,000	10	200
March	7,000	5,000	2,000	10	200
April	8,000	6,000	2,000	10	200
	£56,000	£15,000	£41,000	10%	£4,100
Shortage of turnover					£41,000
10 per cent on £41,000					4,100
Increased cost of working as ascertained by the assessor					400
					£4,500

Duties of the Assessor.

The first duty of the assessor is to observe equity between the parties contracting. At the same time he must not wander from the basic principle adopted in the contract for assessing the extent of the loss, but under the condition, which in some policies is marked "3" and in others "7," reading:

"In adjusting a loss due allowance shall be made in the turnover for all extraordinary or other circumstances of the business," he can to a certain extent, assist in arriving at this equity. Of course, the intention of the policy is that insured must not at any time obtain a larger sum that the amount of net profits he would

have received from his trading for the period indemnified, had there been no interruption in his business. Under the present indemnity clause it seems practically impossible to arrive at an equitable adjustment. As turnover itself is such a fluctuating item in any ordinary business, to use it as a basis of arriving at the percentage of loss on shortage, is as "building a house on sand." Turnover is too shifty in these States, general trade, labor conditions, changeable seasons, all affect the takings or sales of a business. As a matter of fact, any accountant who has gone through various books of traders will agree that the turnover for the year, or even for the month, is added to, or lessened by, very simple causes. In assessing a loss under the heading "output," the variation does not extent so much, but on the other hand, output is more liable to labor conditions. It is plain, therefore, that for the accountant to adhere strictly to the wording of the policy would mean an inequitable settlement. The policy defines clearly whether the assessor shall certify as to the loss being based on turnover or output, the meaning of both headings being given in the policy. This direct instruction is, I fear, likely to cause considerable loss to the company other than should be. Many businesses carry on both manufacturing and trading, such as a costume, shirt, or clothing manufacturer. Such firms buy a considerable quantity of their goods ready-made and manufacture a great part as well. Then it is obvious that the question as to whether the loss should be based on output or turnover, or on both together, should be left to the appointed accountant to decide. I had an assessment under these circumstances and under Condition 3, by working an output and turnover for each department the loss was 17 per cent less than the result of turnover only.

Labor Conditions: I would like now to point out how increased cost of labor proves the instability of the word "turnover." A firm's turnover for 1912 is, say, £10,000. The net profit for the same year is £500. A fire occurred ten months afterwards, and the firm has to be paid a percentage on shortage of the turnover for each month after the fire as from the corresponding month of the previous year. He finds that owing to general increased cost he has had to put up the prices of his goods on the market, with the result his net profit is the same as last year, perhaps less; but the turnover has increased considerably.

We now come to a very important point and one that should be seriously debated. The policy as you are aware, contracts to pay monthly the percentage of shortage for the period of indemnity. We find that after a fire the insured has a shortage of turnover for, say, the first three months, the next three months he has a greater turnover compared with the corresponding month of the twelve months preceding the fire, and the following three months again a shortage. The accountant is not allowed to take the contract as equity would interpret it, and set off the overplus of turnover against the shortage, thus certifying to a shortage for the whole period. We find then that the insured is receiving more than he is entitled to. There is no doubt that the policy should be altered to remedy this serious defect. I am giving an example showing where the insured under the system laid down obtains a far greater sum of money than he should.

We must not forget that the payment of the money monthly assists the insured to carry on his business better, and also though the period may cover some quiet months of the turnover, the standing charges have to be paid without deduction. Let us suppose that a trader wishes to take advantage of this clause, the following example will show how detrimental it is to the insuring companies.

A warehouse insures for £1,000; covering net profit and standing charges; period of indemnity, nine months; a fire occurs August 31, 1914; the turnover for the twelve months immediately preceding the fire was £10,000. The ascertained percentage of insurance to turnover is 10 per cent:

Turnover, 1913.		Turnover After Fire.	Shortage.	Overplus.
September	£800	nil.	800	...
October	750	200	550	...
November	900	600	300	...
December	1,000	700	300	...
1914.				
January	600	900	...	300
February	750	850	...	100
March	900	650	250	...
April	600	500	100	...
May	1,000	900	100	...
June	500	...	...	...
July	700	...	...	...
August	500	...	...	...
			£2,400	

The loss under the present reading of the clause is 10 per cent on £2,400—£240.

If the shortage is taken for the whole period the loss would be 10 per cent on £2,000—£200.

Again, another example (occurred). A clothier had his profits insured under the heading "Turnover," the period of indemnity six months. A fire occurs between seasons. His travelers are out obtaining orders which are booked, as is the usual custom, for three months ahead. His shortage of turnover for the first three months is large, for the reason that he is manufacturing goods which are placed on the shelves for delivery in their due course. The next three months his sales exceed the months for the corresponding year, and insured obtains the benefit of the shortage for the first three months without the company receiving the benefit of the overplus for the second three months.

The insurer must specify on the proposal the various standing charges he wishes to cover, under the above heading. This is necessary in order that the assessor may be able to certify that such specified charges have been paid or are payable after the fire, reducing the percentage accordingly should it not be so. The words "Standing Charges" have a simple meaning—namely, charges that remain before a fire and stand to be paid after a fire. They usually include interest, directors' fees, rent, rates and taxes, salaries to permanent staff, auditors' fees, and wages to skilled employes. The latter, namely, wages to skilled employes, I do not think should be classed among standing charges. The policy is issued to cover the earning loss and is based upon the total profits made up of net profits plus the standing charges. This is what he insures for. We all know that an ordinary trading profit and loss account is in two divisions, one the trading account, in which the stock at commencement and the cost of the goods is on the debit side; and the sales, with the stock on hand on the other side, the balance being the gross profit. From this gross profit the profit and loss account is prepared, and against the gross profit all charges connected with the selling and distribution of the goods are debited, the balance being net profit. I, therefore, consider that the term "standing charges" means "standing profit and loss charges," and only items which an accountant would place to the debit of a profit and loss account should be insurable under this heading.

Wages to skilled employes means a portion of the cost of manufacturing goods to bring them to the market, and surely this cannot be an insurable interest under a profits policy. A costume maker may have a designer and a cutter—these are skilled employes. A fire occurs and the business is totally interrupted. He does not wish to lose these skilled employes, but is it necessary for him to keep his designer and cutter for the continuance of busi-

ness if it is totally interrupted? No doubt on business grounds he does not like to lose their services in case he cannot engage others in their place when required, but that is a sentimental loss that has no connection with profits and an insurance thereon. Wages to skilled employes should be eliminated from "standing charges."

I have had a case where even ordinary manufacturing employes' wages were included in list of standing charges, which was altogether wrong.

Items of the general profit and loss charges, such as interest, directors' and auditors' fees, rates and taxes, and salaries, are for the most part payable after a fire, and can be fairly classed as within the meaning of standing charges.

Partners' Drawings.—These, at times, have been included in standing charges, but the same principal applies here as in the case with wages to skilled employes. Partners' drawings cannot possibly be a standing charge under a profits policy. If either of the partners received a salary for his services this would be a profit and loss item, but the word "drawings" means "an amount drawn on account of his share in the yearly profits," and that is already insured under the heading "Net Profits."

This is automatic in two ways:

1. If the net profit, plus standing charges, is greater than the insurance, the percentage is calculated only upon the lesser sum; therefore:

Insurance, £5,000; total profits, £7,500; turnover, £50,000. The percentage is calculated upon the insurance over turnover, and equals 1-10th. The insured loses the difference (£2,500) between the insurance and the total profits, or, on the same turnover 1-20th.

2. When the interruption to the business is longer than the period insured.

Effect of a Fire Under "Output and Turnover."

The damage and subsequent loss attached to a profits policy cannot be measured by that of a fire policy, although the rating is the same. Presuming:

"Moral Hazard" means origin or cause.

"Structural Hazard" means the damage likely to be caused (once the fire starts) to the building and contents.

Turnover.—A warehouse being burnt out, the loss under the fire policy is practically a total one, but in all probability the profits policy will only pay for three or four months' interruption, as new premises and stock are obtainable.

Output.—A fire destroys the main power of a factory; the fire policy pays only the value of the machine or machines destroyed, perhaps only the cost of repairing same. Under the profits policy the loss would be heavy, as the mainspring of the factory being burnt, a total stoppage of business must occur till the arrival of fresh power from abroad. My experience shows me that the percentage of loss is higher under "Output" than under "Turnover"; also that, although a total loss is not only possible, but probable under the fire policy; under the profits policy it is possible, but not probable.

The clause of the policy reads:

"Such sum as the insured shall necessarily pay for increase in cost of working to continue the business during the period of indemnity in consequence of such interruption or interference.

"Provided that if the sum hereby insured shall be less than the amount of the profits for the whole of the last financial year preceding the fire, then the amount payable for such increase in cost of working shall be proportionately reduced."

You will notice that the accountant has to use discretion in interpreting this clause, but he should keep in view the fact that whatever he certifies to as increased cost of working must be expenditure necessary to continue the business. Further than that, I consider that it is not only to continue the business, but also to make or increase turnover. It is clear that underwriters mean that if the insured can, by spending £100, taking temporary premises, installing machinery, advertising, etc., increase the turnover, these would be legitimate charges against increased cost of working; because the company receives the benefit in not paying the percentage on so much shortage. However, items have crept into assessments which should not have been included, but if the assessor takes the principle that every penny charged to increased cost has increased the turnover, then he cannot go wrong in his certificate.

The proviso is practically attaching average condition to this part of the contract, and which proviso was not embodied in the earlier policies. The average is based upon the assured paying his proportion of the extra cost if the sum insured is less than the profit for the whole of the last financial year preceding the fire. It does not stipulate that increased cost will only be recoverable to normal turnover and shall be proportionately reduced if the turnover for any month after the fire during the period of indemnity exceeds that of the corresponding month for the twelve months immediately preceding the fire.

Appointment of Accountant Whose Certificate Shall Be Final.

Experience of losses that have occurred shows this method is unfavorable to the companies.

The most equitable way would be for the insured and the company each to appoint their accountant, and any difference between the accounts to be referred to arbitration.

Although the accountant has to certify only as to figures, immediate attention on his part will minimize the period of interruption. The insured, after a fire, is not the level-headed man he was when the business was running smoothly. A few will start with renewed energy, but others become dilatory and waste much time.

The accountant should at once visit the scene of the fire, size up the situation and possibilities of an early start, and assist the insured to find suitable premises, install power, or purchase raw material; then probably turnover will become normal a month earlier than if insured did not receive the benefit of the accountant's advice and a fillip to his energy. The accountant should also watch that all expenses incurred under heading "Increased cost of working" is money paid to assist in the increase of turnover; and if he finds insured is charging items not necessary to bring the turnover to normal or maintain it at normal, the expenditure should be stopped. I found the best plan was to request the assured to obtain permission before expending any moneys under this heading, excepting, of course, small amounts. By this means the accountant has a continuous report.

With the exception of two, the conditions are easy to interpret.

The exceptions are:

(1) In adjusting a loss, due allowance shall be made in the turnover for all extraordinary and other circumstances of the business.

This is a very elastic condition and rather hard to understand. It would be a matter of opinion as to whether a circumstance was extraordinary or ordinary, and the following words "any other" means any circumstances other the extraordinary.

Suggest for debate the following revision:

In adjusting a loss, due allowance shall be made for any extraordinary circumstances or varying conditions of the business increasing or decreasing turnover not consequent upon the fire.

(2) All differences arising out of this policy shall be referred to the decision of an arbitrator, to be appointed by the

parties in difference; or, if they cannot agree upon a single arbitrator, to the decision of two arbitrators, one to be appointed, in writing, by each of the parties or, in case of disagreement between the arbitrators to the decision of an umpire, to be appointed, in writing, by the arbitrators before entering on the reference; and unless and until the condition as to furnishing and verifying the claim has been complied with, and an award has been made, the company shall not be liable for any loss, and such award shall be a condition precedent to any liability of the company, or any right of action against the company in respect of such claim.

The accountant nominated, and frequently endorsed upon the policy, is agreed to by the company and the assured, and, being so, no difference can arise as to the amount payable; his certificate given on behalf of both contracting parties is final. The only reference that could be arbitrated upon would be: "If the assured had or had not fulfilled his part of the conditions of the contract."

Proposals.

In accepting a proposal, the following information will assist in deciding acceptance and as to holdings:

Number of years the business has been in existence.

Integrity and financial position of the firm.

Has the turnover or output increased or decreased during the past financial year?

In the event of a fire, is the stock, power, or raw material procurable locally?

If any member of the firm has an interest in another business of a similar description.

Is there a cable code used?

In conclusion, I thank the president and committee for the opportunity given me to read this lecture, and also the members present for their attendance, and feel that in the discussion that follows the little knowledge I have of the subject will be augmented by the criticisms on the paper.

THE AMAZING NEW YORK WORKMEN'S COMPENSATION COMMISSION

ON June last, Chairman Dowling, of the New York Workmen's Compensation Commission, which was then on the point of undertaking the serious part of its duties, viz., safeguarding the rights and interests of both injured workers and their employers in the matter of the legal compensation awarded to the former, issued a somewhat grandiose statement in the course of which he made the remark: "After July 1, the Commission will sit as a court, and its decisions will be final in settlements of awards for injuries sustained while at work." This paper commented on the statement at the time and suggested that there might be difficulties in the way of carrying out this, as well as other declarations of Chairman Dowling, at least if the work of the Commission, "sitting as a court," were to be other than the veriest farce. As we then anticipated the past three months have been enough to demonstrate that all is not well with the best of all possible workmen's compensation laws, administered by the best of all possible workmen's compensation commissions. Complaints have begun to be heard from many directions that the Commission is dilatory, careless and indifferent in its administration of the law; that injured workers, or their families, have been compelled to wait an unconscionable time for attention to their claims; that publicity, rather than social service, is foremost in the mind of the Chairman and of some other members of the Commission. As political considerations make the present an inopportune time for such complaints to be given currency among the citizens, and particularly the laboring men, of New York, Chairman Dowling has thought it desirable to give out another statement, which appears in the New York "Evening Post," of October 21. So extraordinary is this statement as an illustration of a workmen's compensation commission "sitting as a court" and making decisions which "will be final in settlements of awards for injuries sustained while at work," that it is given here in full, as follows:

"The Workmen's Compensation Commission, during the current week, will pass upon and dispose of 2,000 claims, the number including 70 death cases. Six hundred of these cases were heard day before yesterday. These cases were prepared and analyzed by the claims department last week, said department constantly working one week in advance. The Commission there is now handling cases more rapidly than they are being filed.

"The actual number of claims received by the Commission since it commenced business is 15,365. The right to make a claim accrued to the first claimant on the 15th day of July, and the first case was heard on the 20th of July. Since that time there has been a constant increase in the number of claims heard each week, until the department has passed over the hilltop, and is now able to take care of the claims with greater rapidity than they are filed.

"This week, for instance, will represent a gain of at least 500 cases on the number filed, and the completed calendar shows 6,818 cases with between 9,500 and 10,000 pending. This, in point of time, shows that the Commission is about a month behind with its work. There will always be a number of claims pending equal to the number of compensatable claims arising within a given month, for two weeks must elapse before the right to claim accrues, and another two weeks is a fair average of the time it requires to prepare and complete a claim.

"This record, the Commission contends, is not surpassed by the record of any State in the Union, although nearly thirty States have adopted compensation laws.

"The public has been led into believing that a vast number of claims have been filed, and the reason for this is that under the law there must be filed with the Commission a notice for all cases of injury. These notices were at first given a number in the department, and the number grew very rapidly on account of the great number of first notices thus received, which have reached the aggregate of 60,000. But now the department gives a number only to a case which on its face is compensatable, and this represents the actual number of real claims. Such notices which on their face indicate claims not compensatable are filed alphabetically, and if subsequent information raises them into a claim they are put upon the docket and are handled as are all other claims. It is probable that in this manner the actual number of claims will be increased about 15 per cent.

"When it is considered that on a given day the Commission received a full onslaught of the business of the entire State, the Commission is proud of its record of being able within ninety days to take care of the cases as fast as they come, and it has no apologies whatever to offer.

"There is no better index of the work of the Commission than the expense ratio, which is already within 7 per cent. This is in starting contrast to the expense ratios under the old plan of 40 per cent to 60 per cent. By expense ratio I mean the cost of operation compared to the total awards granted, and not to total premiums. If comparison were instituted on the latter basis, the expense ratio would be well within 5 per cent."

It is certainly not to be wondered at that Chairman Dowling is astonished at the unsurpassed record of his own Commission. It may be taken as beyond doubt that the record was never surpassed either in any State of the Union or in any country in the world.

A Commission charged with the duty of determining "settlements of awards for injuries sustained while at work," sitting as a court in the performance of this duty, and making 2,000 decision in a week, 600 in a single day, one a minute for ten straight hours out of twenty-four! Surely, the like of this was never seen or heard of!

And these amazing results are obtained at an expense ratio of less than 7 per cent! In Germany, where efficiency in these matters is really and truly unsurpassed, the employers' accident insurance associations, which administer the workmen's compensation, are unable to get an expense ratio below about 12 per cent, in spite of the fact that they have none of the cost of investigating and caring for the minor accident cases, nor any accident cases at all until after thirteen weeks from the time of the occurrence of the accidents. But the New York Commission promises to do better yet in the way of its expense ratio. Mr. W. C. Archer, General Manager of the Commission, in a statement simultaneous with that of Chairman Dowling, asserts that his present staff has matters so well in hand that he has already been able to reduce its number to 206 employes, and expects to drop some thirty of these in the near future. In Germany some 38,000 persons on the staffs of the employers' associations are required for only about ten times the number of insured workers that are covered in New York. That is, the Germans would require 3,800 employes to do what Mr. Archer expects shortly to be doing with 176 employes. Could efficiency be more startlingly illustrated?

Of course, the figures show that the New York Commission is not doing the work which it is its duty to do. Both the workers and the employers of the State are being in reality abused; and the public is being bamboozled by official statements which the merest tyro in workmen's compensation knows to be utterly misleading, to say the least.

NOTES ON INSURANCE, AMERICAN AND FOREIGN

Negroes in the United States.—The Bureau of the Census, in a bulletin shortly to be issued, will give the results of the census of 1910 with respect to the negro population of the United States, as found by the census takers. The statistics obtained deal with the negro population not only in the matter of its number and distribution, but also as regards its rate of increase, sex and age distribution, marital condition, illiteracy, occupational distribution, mortality (so far as obtainable in 1910) and other social and economic relations. Although it is now four years since the statistical information was gathered, and consequently great changes in all the figures have since necessarily taken place, none the less this survey of the country's negro population is the latest available and indeed the only approximately complete source of knowledge upon the subject. The substance of the bulletin is therefore here given:

The number of negroes in the United States (exclusive of outlying possessions) in 1910 was 9,827,763 (of whom 4,885,881 were males and 4,941,882 were females); and they formed 10.7 per cent of the total population. In 1900 the number of negroes was 8,833,994, or 11.6 per cent of the total population of that date. The increase among the negroes during the decade was 993,769, or 11.2 per cent, as compared with an increase of 20.8 per cent among the native whites and of 30.7 per cent among the foreign-born whites. The growth of the negro population results from their own natural increase, while the growth of the white population is accelerated by the great influx of immigrants and the high birth-rate in immigrant families.

Of the total number of negroes in 1910 about one-fifth were reported as mulatto; that is, as having some white blood. The proportion that mulattoes formed of the total negro population increased from 12 per cent in 1870 to 15.2 per cent in 1890, and to 20.9 per cent in 1910.

The age distribution of the negroes was as follows:

Age Group.	Number.	Per Cent Distribution.
All ages*	9,827,763	100.0
Under 5 years	1,253,288	12.9
5 to 14 years	2,401,819	24.4
15 to 24 years	2,091,211	21.3
25 to 44 years	2,638,178	26.8
45 to 64 years	1,108,103	11.3
65 years and over	294,124	3.0

*Includes persons of unknown age.

The age distribution of the negroes does not differ materially from that of the native whites. Negro males in the United States of voting age numbered 2,458,873 in 1910, and the negro females of voting age numbered 2,427,742.

Of the negroes six to nine years of age, 488,954, or 49.3 per cent, were reported as having attended school during the school year 1909-10; of those ten to fourteen years of age, 791,995, or 68.6 per cent, were so reported; and of those fifteen to twenty years of age, 338,750, or 26.5 per cent. In each age group the percentage of school attendance was much lower for the negroes than for the whites.

Of the total number of negroes ten years of age and over, 2,227,731, or 30.4 per cent, were reported as illiterate; among the whites the percentage of illiteracy was 15, being 3 among native whites, and 12.7 among foreign-born whites. The percentage of illiteracy among negroes decreased from 57.1 per cent in 1890 to 44.5 in 1900, and to 30.4 in 1910.

Nearly three-fourths of the negroes (7,138,534, or 72.6 per cent) were rural dwellers, while about one-fourth (2,689,229, or 27.4 per cent) lived in towns or cities of at least 2,500 inhabitants. Negroes formed 14.5 per cent of the rural population, as compared with 6.3 per cent of the urban. In the Southern States the great majority of the negroes lived in rural districts, while of the negroes of the North and of the West a large proportion were city dwellers.

Farms operated by negroes in 1910 numbered 893,370; of this number, 218,972 were operated by their owners, 672,964 by tenants, and 1,434 by managers. The number of farms owned by negroes increased by 31,175, or 16.6 per cent, between 1900 and 1910, and the number of negro tenants increased by 115,790, or 20.8 per cent, during the decade. The total value of farm property operated by negroes in 1910 was $1,144,181,000, as compared with $499,941,000 in 1900, an increase more than twofold during the decade. The statistics show that 1,806,727 negro males and 1,050,849 negro females were engaged in agriculture.

An important feature of the statistical material to be issued by the Bureau of the Census will be the first study of the mortality among negroes in the United States upon which reliance can be placed. For the first time, the negroes have been separated in this respect from the other colored races,—i. e. Indians, Chinese, Japanese, etc. Owing to the fact that the greater part of the South was in 1910 not included in the registration area of the United States, the mortality statistics will necessarily be imperfect for the total negro population, inasmuch as only figures from the registration States and certain selected cities were available. The death-rate ascertained for negroes on this basis was 25.5 per 1,000, as compared with the rate of 29.4 obtained from a much more restricted area in 1900. The decrease in the negro death-rate in Southern municipalities, from 1900 to 1910, was especially marked.

Classified Fire Risks in Illinois in 1913.—The Insurance De-

partment of Illinois has recently issued its figures for the fire insurance business written in that State in 1913, according to the classification of risks which the fire insurance companies doing business in the State are required to make. The figures are instructive as indicating in a rough way the proportionate subdivisions of insurable property in Illinois, although it must not be forgotten that the enormous volume of surplus insurance going to fire insurance companies not admitted to do business in Illinois (all of it supposed to be reported to the Insurance Department, but much of it notoriously not reported) makes the statistics of little value as indicative of the total amount of insurable property within the State in 1913. The figures are as follows:

Classes.	Number of Policies.	Amount at Risk.	Premiums Received.	Losses Paid.	Ratio Loss to Premium. Pct.
Dwellings and contents	$484,846	$704,753,694	$6,664,424	$2,881,229	43.23
Mercantile buildings and contents	359,161	593,151,034	7,512,645	4,047,039	53.87
Special hazards	186,507	524,537,110	6,304,615	4,057,354	64.35
All other risks	164,191	520,575,001	4,323,522	2,399,985	55.49
Totals	$1,194,705	$2,343,016,839	$24,805,205	$13,385,667	53.99

Victor Talking Machine Company Does Not Discriminate Against Workers with Families.—There appeared among the Items of Insurance News, in the August 30th issue of this paper, an item to the effect that the Victor Talking Machine Company, of Camden, N. J., by reason of workmen's compensation "gives preferenee to men without families." This item was derived from an usually accurate and trustworthy contemporary; but a letter from the company in question informs us that the statement is without foundation in fact. The correction is accordingly gladly made here, and the following interesting paragraph from the company's letter is given in full:

"For your further information, we beg to advise you that we have in operation for the use of our employes a Beneficial Society and Life Insurance Plan in connection therewith, together with a Pension Plan after certain years of service. In order to guard against the employment of individuals who might be a menace to other employes, we insist on a medical examination to determine that the party is free from tuberculosis and other contagious diseases. By far the largest percentage of employes in our plant are married, and when you consider that we have about 6,000 employes, you will see that the report that you bring to our attention is entirely without foundation. Further, the membership of our employes in the Beneficial and Insurance Society above mentioned is entirely voluntary, and at this writing the membership in the Society, composed entirely of our employes, is over 5,100."

The Cost of the Permanent Fireproofing of Cotton Goods.—At the semi-annual meeting of the National Association of Cotton Manufacturers, held at Lenox, Mass., on September 29, a paper was expected from Mr. J E. Tod, of Manchester, England, on the cost of fireproofing cotton goods. Mr. Tod's address did not arrive, but the following interesting summary of the subject is available.

* * *

[Introductory Note by the Secretary of the National Association of Cotton Manufacturers.

It will be remembered that Professor William H. Perkin, of Manchester, Eng., contributed a paper at the Atlantic City meeting of this Association, September 30, 1913, upon the Method of Permanent Fireproofing of Cotton Goods, by means of two chemicals, each of which were soluble in water, and were applied to the cloth in subsequent processes.

When the second solution came in contact with the first a chemical reaction took place producing throughout the fabric a precipitate which rendered the goods flame proof, but which was unlike either of the constituent solutions in that it was insoluble in water.

The following article by Mr. Eugene Szepesi, of 30 Church Street, New York, in the Textile Manufacturers' Journal of February 28, 1914, was called to Dr. Perkin's attention and by him referred to Mr. Tod, the general manager of his laboratory, for reply, and as the Association has not received the rejoinder other than the letter as follows, it is assumed that the disturbances in foreign mail have interfered with some fuller rejoinder which will be reserved for the transactions.]

"While there is not as urgent demand in this country as in England for a cheap and permanent process for rendering flannelettes and other napped cotton goods non-inflammable, the commercial advantage of such a process is recognized, and for special uses certain cotton fabrics are regularly treated to ensure non-inflammability. Because of these facts the paper on The Permanent Fireproofing of Cotton Goods, by Professor William Henry Perkin, Manchester, England, that was read at the convention of the National Association of Cotton Manufacturers last Fall, attracted unusual attention. This paper not only reviewed practically all known processes of fire-proofing cotton goods, but gave to the world the details of a process developed by Professor Perkin that is not only superior to others in all other features, but is permanent, being affected neither by washing nor wear.

"Although no attempt was made in the paper to estimate the cost of the process, the frequent reference to it as being adapted for cheap goods and as being a commercial success may have led manufacturers to believe that it involved only a slight increase in the cost of fabrics thus finished. That the opposite is the case seems to be proved by an investigation that was recently made. The manufacturer who made these experiments did not go so far as to process the goods in a commercial way, because tentative investigation seemed to prove conclusively that, while the process is undoubtedly a technical success, it is too expensive for common use. The report submitted by this manufacturer is as follows:

"The two substances proposed by Professor Perkin are sodium stannate and ammonium sulphate. The present wholesale price of sodium stannate, 44 per cent pure, is 60 cents per pound; chemically pure $1 per pound. Ammonium sulphate in a moist condition and about 25 per cent pure is 10 cents per pound, chemically pure, 30 cents per pound.

"The value of a pound of print cloth varies from 25½ cents to 27 cents per pound. Under all circumstances the process must increase the weight of such fabric from 10 to 15 per cent in order to make it effective. Therefore, 10 per cent of sodium stannate on one pound of cotton fabric will amount to 10 cents and thus 5 per cent of ammonium sulphate used in this process will amount to 3 cents making a total of 13 cents for chemicals in one pound of cloth.

"The finishing process is also an expensive one. It requires a double immersion and double drying, which will cost at least 2 cents per pound of cloth, bringing the total cost of fireproofing to 15 cents. In ordinary prints there are from 7½ to 8 yards per pound, making the process cost about 2 cents per yard. The selling price of print cloth varies from 3½ to 4 cents, therefore for prints the process is out of the question.

"For gray goods used in flannelettes the value of one pound

of cloth varies from 28½ to 30 cents. The finishing of this material will absorb a considerably greater quantity of the fireproofing material than the print, so it is reasonable to say that it will require at least 25 per cent per pound of finishing material, bringing the cost of finishing one pound of flannelette to 25 cents. As there are about five yards to one pound, the cost of fireproofing per yard will amount to 5 cents which cost again is prohibitive for general use.

"The fireproofing of many cottons is a very desirable feature, particularly of most napped cottons, but its practical solution is only possible if the price of the finished fabric is only slightly above the price of the non-inflammable fabric, otherwise it will not pay the manufacturer to put it on the market."

The letter from Mr. Tod, which has been referred to above, states:

"The cost of fireproofing flannelette by the non-flam process, as regards work done in this country, is greatly exaggerated in the costings given in the article from the Textile Manufacturers' Journal of February 28, 1914.

"The cost of chemicals—sodium stannate and ammonium sulphate—as the goods have been run commercially by us—has varied from one-quarter penny to one-half penny per yard, the lower price being for flannelettes of lower quality, 32 inches wide, and the higher price for good quality, 36 inches wide. The cost of labor has been the same in all cases, one-quarter penny per yard.

"To these prices we ourselves added one-eighth penny per yard for royalties, experimental and research work, etc. The total additional cost for the fireproofing process was thus from five-eighths of a penny to seven-eighths of a penny per yard.

"You will notice we have referred to this process in the above statements somewhat in the past tense. As a matter of fact, we are still fireproofing by this process, but are expecting shortly to change to another and much better one.

"You will be interested to hear that Professor Perkin and his assistants, continuing their researches have discovered a new process for permanently fireproofing cotton materials. In this case the cost of the chemicals is not more than one-half and may be as low as one-quarter of the older process.

"The cost of labor will not be higher. In fact, we are confident it will be considerably lower.

"Machinery is now being erected to work this process on the commercial scale.

"About twelve months ago we threw open the process described in Professor Perkin's lecture at the meeting of your Association at Atlantic City, September, 1913, so the cost is reduced by the amount of the royalties—one-eight penny per yard."

It is needless to make a reminder that recent events have disturbed prices of chemicals so that the relations between the two statements may be relative and not absolute.

INSURANCE NEWS IN THE WEST

THERE are constantly happening events which in themselves are not very important, and yet taken together seem to indicate important changes now taking place in the insurance business or likely to take place in the near future. One of these was the recent recommendation to the joint large cities committee of the Union and Bureau, by the joint conference committee of the two bodies, that it give a hearing to complaints of conditions in Indianapolis which the agents hold ought to be corrected in connection with the reduction in Bureau commissions. Indianapolis was one of the "excepted cities" of the Bureau, which, under the agreement with the Union, it had to get in shape last January, when Chicago was got into line. The agents of Indianapolis entered into an agreement not to accept a reduction in commissions and not to take each other's companies, claiming that this action was taken because they were refused a hearing on certain other matters they wanted dealt with at the same time. Recently the companies gave them notice that unless they withdrew their names from the agreement, their certificates of authority would be suspended on October 15. That brought the required action, but the companies also agreed to the hearing if the agents still desire it. This, together with the changes made in the Chicago and Milwaukee expense reduction programmes, show a tendency to get together and make concessions in the fire business just as was done last December in the liability business.

At Cincinnati there is some talk of passing a rule in the local association limiting companies to their net lines. The purpose of the agents is to restore the practice of exchanging business, which was destroyed by the general introduction of large lines and reinsurance. It is pointed out that the companies would lose nothing in Cincinnati by such a course, as commissions in the city are such that there is very little, if any, profit in reinsuring. This desire to return to the net line system appears to be indicated also by reports of some of those in charge of young companies that the local agents show much greater readiness to take their companies on than was usually shown a few months ago. The sentiment against extensive reinsurance in foreign companies appears to be making a real growth in the West. It is not surprising that it should do so when the agents come to realize that, notwithstnding the retirement of so many companies, competition remains as severe for them as ever, due to the increase in the number of annexes and the pushing out into smaller towns of companies that formerly operated chiefly in the cities.

The fire agents really have been suffering hardships. What with rates going down for nearly ten years, while the activity of mutuals, interinsurers and sprinkler syndicates grew more marked, very many agents have had to fight hard to prevent their premium incomes from being reduced. In addition most of the agents of non-Union companies had to stand some reduction in commissions, either through the organization of the Western Insurance Bureau or the retirement of excess commission companies from the field. It has been a hard struggle to keep up commission income in the face of these changes and harder still to make it grow as rapidly as expenses did. Some relief was found in the growth of the casualty business, but of late workmen's compensation rates are going down also.

While the agents have been facing a hard situation, the companies have also. The fire companies have had the legislation of Kansas, Missouri, Kentucky, and other States to contend with, as well as the same sagging in the rates and losses of business to outside concerns which have affected the agents. Nor can those executives who desire to conduct their business as they please get much comfort out of the Supreme Court decision in the Kansas case, which serves notice on every State that it can regulate rates if it so desires. The liability companies are facing the possibility of having a large part of their business entirely wiped out in a number of States. The agents and the companies are both having their troubles.

Meanwhile, instead of standing together and trying to help each other, they have been doing considerable fighting among themselves. The companies have had to do some things, such as reduce commissions, in order to be fair to the public, and in some cases the agents have resisted. Some of the companies have irritated and injured the agents by doing things they did not have to do, such as making annexes out of whole cloth, without even the excuse

of putting them into the field to save the plant of a reinsured company. The agents have stood back of legislation that was distasteful to the companies, such as the Oliver Law in Missouri, and the companies have refused their support of measures that the agents wanted and which would probably have been good for the business generally. Each class of companies and each class of agents has largely minded its own affairs and taken no interest in legislation adverse to the interests of some other class of the business.

Now the federation movement has taken a strong start. In some of the States officers of local companies of various kinds are taking an active interest with the local and general agents. It looks as if a few months would see a federation in every State in the upper Mississippi Valley. It is noticeable that leaders in this movement are alert to the fact that it cannot succeed as a trades union movement, but must be based on the public good. Utterances at recent federation meetings, taken in connection with those at the Northwest meeting in Chicago, urging co-operation between companies and agents and between both of them and the representatives of the public indicate that sentiment is changing and that a strong effort is to be made to change the "stand-offish" attitude of opposition which largely has characterized the insurance interests, and bring about a situation where that part of the people that is engaged in the insurance business will work with that part which is not in securing through the representatives of all the people legislation and rulings which will make the insurance business serve the people better than it has and remove obstacles which have prevented its being as good a business for those engaged in it as it might have been.

Chicago, October 23, 1914. LA SALLE.

ITEMS OF INSURANCE NEWS.

Two decisions as to the constitutionality of State workmen's compensation laws were handed down during the past week. The most important of these was that of Judge Robert L. Stout, of the Franklin Circuit Court of Frankfort, Ky., in which he over-ruled the demurrer of the defendant in the case of the Workmen's Compesation Board vs. the State Journal Company and upheld the constitutionality of the Workmen's Compensation Act of Kentucky. Judge Stout delivered only a verbal opinion, which was in substance that, while he personally regarded it as a bad law, yet the Legislature had passed it and that twenty odd States of the Union had similar laws which had been held constitutional under constitutions similar in a more or less degree to Kentucky's Constitution, and he therefore did not feel like taking the responsibility of over-riding the views of the Legislature in the matter and therefore over-ruled the demurrer. The case will now be taken on appeal to the Court of Appeals, which is Kentucky's court of last resort, and be argued there in about two weeks.

The other decision was handed down by the New Jersey Court of Errors and Appeals declaring constitutional the employers' liability act. The decision was rendered in the appeal of the Pennsylvania Railroad Company from a decision of the Supreme Court in a case involving $3,000 damages awarded Mary Nuzett, of Camden, whose husband was crushed to death between two cars in the Pennsylvania Terminal, Camden, on July 17, 1912. The Camden Court of Common Pleas previously had awarded the widow a similar verdict.

Members of the Western Insurance Bureau, comprising managers and other officers of fifty of the principal fire insurance companies doing business west of the Alleghenies, in annual session at Atlantic City, N. J., on October 2 unanimously adopted forms for policies and policy writers, drafted by a special committee, which has been giving serious study to its preparation for the past several months. The new form follows closely what is known as the New York standard policy, now effective in Pennsylvania, New Jersey and some Eastern States, and is designed to avoid future conflict in the Western districts conforming to the requirements of States which have imposed certain restrictions upon the fire insurance business.

Under date of October 21, the New York Insurance Department has issued the following bulletin in regard to the plate glass insurance situation in New York City:

"The attention of the Insurance Department is again directed to the plate glass situation in New York City. The conditions in this line of business have been for a long time in an unsettled condition, and extremely unsatisfactory to companies desiring to conduct the business with fairness to their policyholders and brokers and in compliance with the law. The Department has been repeatedly requested by plate glass underwriters to exert its influence towards improving the conditions, and the Department has, in fact, extended to the plate glass companies and the Plate Glass Underwriters' Association every facility with a view of enabling them to bring order out of chaotic conditions and establishing rates and commissions with due regard to the rights of the insuring public and the economical administration of the business. With, however, the greatest latitude allowed to these companies, they have been unable to agree upon just and non-discriminatory ratings, and the Plate Glass Underwriters' Association has failed to effect the purpose which is its greatest justification for existence, viz., the limitation of expenses, the commissions paid by its members being in some cases as high as 45 per cent. Demands of the Department on companies for the filing of the rates in force have in some cases been met with indifferent and unsatisfactory replies.

"It is the immediate purpose of the Department to make a thorough investigation of the plate glass situation, the investigation being extended to the underwriting practices of the individual companies regardless of their affiliation with the Plate Glass Underwriters' Association. Discovery of violations of the anti-discrimination law or other improper practices will be vigorously followed up by the Department, for the purpose of imposing such penalties as may be provided by law, even to the extent of acting under Section 32, if, in the judgment of the Superintendent of Insurance, it will best promote the interests of the people to revoke the certificate of authority of offending corporations doing business in this State."

There are twenty-one so-called companies licensed in Canada to transact accident, sickness, guarantee, plate glass, burglary and steam boiler insurance, etc., says the "Financial Chronicle." We use the word "so-called," because most of these companies are owned and controlled by British or United States companies. The total assets of the twenty-one companies at December 31, 1913, amounted to $7,540,570.92, while the total liabilities, excluding capital, were $2,111,133.74, showing a surplus to policyholders of $5,429,437.18. The net surplus over the capital stock and all liabilities is $2,746,226.23.

The total assets in Canada of the twenty British and foreign companies licensed for these classes of insurance, were $3,249,544.35, while the liabilities were $1,823,240.61, showing an excess of assets in Canada over liabilities in Canada of $1,426,303.74.

The net premium income of the twenty-one Canadian companies in 1913 was $3,583,849.64, and the total income, excluding amounts received on account of capital stock, was $4,010,276.11. The amounts received on account of capital stock totalled $454,342.65. The total amount paid for losses was $1,343,860.39; for general expenses, $1,833,206.66, and for dividends to stockholders, $166,074.25, making the total cash expenditure, $3,343,141.30. The excess of income over expenditure was accordingly $662,134.81.

President Massey Wilson, of the International Life, of St. Louis, has evolved a plan whereby cotton warehouse receipts will be accepted as collateral in the payment of life premiums. Under this plan the company will accept the notes of its policyholders payable on or before twelve months from date with the warehouse receipt attached to the note for an amount of cotton equal to the premium, on the basis of 6 cents a pound middling. The company will also follow the same method in the payment of interest on loans secured by farm mortgages in the South, of which it has about $2,500,000. The rate of interest charged will be that fixed by the policy contract, and the company will designate a local bank to act as its agent to determine the reliability of the warehouse issuing the receipt.

In his annual report, State Fire Marshal Parkman, of Kansas, shows that during the last nine months of 1913, the State Department being that old, the fire loss amounted to $3,103,330. Forty-four per cent of this was on uninsured property. Taking it that the loss the first three months was in the same proportion, Marshal Parkman figures that the total loss for 1913 was $4,257,800.

During the last nine months of 1913, 963 dwellings were destroyed by fire, involving a loss of $601,050. Five hundred and seven barns, valued at $439,001, were burned; the loss on 188 store buildings was $578,564.

The cause given as responsible for the greatest damage was "sparks," which caused 193 fires with a loss of $353,953. Adjoining fires caused 237 losses, worth $274,813; and was followed by eight fires caused by hot boxes which destroyed $241,680 worth of property. In all there were 2,345 fires, and according to the marshal, fully 1,800 were preventable.

According to data compiled by the "Spectator," New York, seventy-two companies transacting marine and inland insurance in the United States received premiums, in 1913, to the amount of $34,000,031, while suffering losses to a total of $20,482,847, being a loss ratio of 60.24. Total insurance in force on December 31, 1913, amounted to $298,196,293.

Seventy-four fire, marine and casualty companies writing automobile property damage insurance, being all those reporting to the New York Insurance Department, received total premiums on that class of business in 1913 of $6,585,248 and suffered losses of $2,681,989, showing an average loss ratio of 40.7 per cent. It is noticeable, however, that the ratio of losses to premiums shows wide variation as between different companies, running from as low as 5.7 per cent to as high as 204.2 per cent. It should be remembered that about half the companies include claim expenses in their report of losses incurred.

FINANCIAL AND COMMERCIAL REVIEW

WAR influences continue of course to predominate in the financial and business situation. Apart from the controlling factors created by the war the interest which is absorbed in it as the greatest conflict in human history would naturally tend to lessen influences derived from other considerations. Nor is it likely that unless or until the war enters a definite phase which seems to assure the probable outcome, will it be possible for our ordinary business affairs to be conducted with a greater regard for ordinary factors. Of such a turn in the tide of war there is yet no positive indication.

Apropos the war, evidence seems to be accumulating that Germany and Austria are economically much harder hit even so early in the war than are the Allies. Long before the war Austria was suffering from a severe economic depression bordering on collapse and there was no reason to suppose that Germany could endure war very long without exhibiting increasing symptoms of economic adversity. When the Imperial tax was levied a year ago on German capital it was a manifestation of fundamental extremity which belied the fair exterior of German prosperity. There has been more than a little warrant for the assumption that before the war Germany was headed for trouble in the event of any great strain, for the pace of German economic progress had been made under forced draught.

German resources were quite adequate to the support of German commercial expansion rapid and tremendous as it had been, but these resources were not adequate to supporting at the same time the enormous expansion of German militarism. Had the war been postponed a few years it is not unlikely that the commercial party would have gained the upper hand and Germany would have been content to remain the strong man armed for defense, but not for aggression. The ante-bellum situation was such as to indicate a possibility that if the military party appears to be waging a losing war the popularity of the conflict will vanish in Germany and a sudden end may be put to what must otherwise be a protracted and ruinous contest for all nations engaged and not much less so for neutral countries like ourselves, even though we may reasonably anticipate to get through the coming years with much less suffering than will be experienced in other lands.

At all events German financial systems which have been detected here suggest that economic power is already beginning to count in the scales of war. English and French exchange are still selling at phenomenal premiums, but reichsmarks have been quoted at steady declines to an abnormal discount. The implication is clear that credits on Germany are being traded for balances on this side and the movement of German remittance tends to corroborate other indications such as were set forth in THE MARKET WORLD AND CHRONICLE last week of a far greater economic unfitness for war on Germany's part than the official view has proclaimed.

Meanwhile the decline in marks is also confirmatory of reports that desperate German efforts are being made here to buy supplies which the purchasers will take a chance of receiving through neutral countries. Great Britain seems to be aware of such efforts. British marine underwriters have already begun to curtail insurance on cargoes in the endeavor to prevent contraband or conditional contraband from getting into Germany; and it is not improbable that British naval control of the seas will be exercised in more drastic ways to blockade the enemies of Great Britain. Operations of the kind intimated could interfere to some extent with our recovering export trade.

So far as concerns the foreign financial conditions which affect us most it is gratifying to note that the position of London is steadily improving. The Bank of England has more than doubled the stock of gold which it held at the low level early in August, and the ratio of its reserves to liablities is steadily rising each week. An increasing gold cover is being provided for the legal tender emergency currency which the British Government has emitted and the London money market generally appears to be getting into a condition propitious for the termination of the moratorium next month.

Mention should be made of the predictions of Mr. Frewen and and other critics of the various novel measures which the British Government has adopted to assist the financial situation. According to these predictions trouble will follow not long after the ending of the moratorium unless the Bank Act is suspended, but as yet there are no sufficient reasons for apprehension although some uneasiness seems to be denoted by the tenor of the international conferences at Washington. These conferences so far have not yielded anything definite enough in the way of plans or statements to provide a basis for discussion, but if the Washington despatches are to be trusted British official finance is animated by an anxiety to draw gold from the United States which British private finance does not share.

Perhaps this is because the official view is somewhat doubtful of the workings of the devices which the Treasury has adopted, but the London banking community as a whole seems fairly well satisfied with the way in which matters are going in respect to British-American affairs. Discounts are easy in London and there is a growing willingness to accept American bills, a willingness which has in fact expressed itself in a rather striking fashion through the actual refusal to accept some payments of maturing obligations unless the American debtors preferred a settlement to a contivation of their bills.

How much is going to be accomplished by the negotiation which Sir George Paish and Mr. Blackett are conducting here for British finance has come to be something of a question. First reports after the British visitors reached Washington represented them as formulating rather explicit demands for the settlement of our remaining debit balance, of perhaps $250,000,000, in gold. Subsequently it has seemed that compromises were under discussion, including the substitution of a large export of cotton for storage in lieu of gold, and it is altogether likely that before our British visitors go away some beneficial agreements will have been entered into which will promote a resumption of business in the cotton and securities markets.

Great Britain's interest in the cotton industry can hardly fail to assist pending projects for the relief of the cotton situation, in-

cluding the plans for reopening the cotton exchanges and for creating a large banking pool to make cotton loans. However, it is not manifest as yet that Sir George Paish and Secretary McAdoo have anything but well meaning intentions which may lead to blunders, and Mr. McAdoo's disposition to exaggerate the functions of Government must provoke some disquiet until it is seen what all these governmental interchanges of ideas may end in.

It happens also that although the sterling exchange market is still high, conditions are getting better all the time as a result of the headway which we have made in paying our debts abroad, the improvement which has been effected in the London money market, and especially the swelling volume of export trade orders which are coming in, particularly from Europe. To be sure, this is a feverish kind of trade, but it is reducing our debit balance abroad. Nothing could better illustrate how the foreign exchange situation is working than the fact the gold fund committee has been able to get along without selling much exchange, and it would not be surprising if the actual exports of gold by the committee and on the New York City loan account fell far short of reaching the aggregate provided for.

There are some very competent foreign exchange bankers who believe that it will not be many months before sterling exchange is quoted here at quite as much of an abnormal discount as it is now at an abnormal premium, but it should be admitted that these opinions are subject to revision for any cause and especially because of the international transactions which may take place in securities. The return of American securities held in Europe has to be dealt with in all financial reckonings, but bankers think that a very large return can be accommodated without disastrous dislocation of funds.

In any case the matter of reopening the Stock Exchange is a question which is pressing for an answer. An unorganized outside market has been established in which dealings have gone so far that speculative trading has become possible and this situation calls for a movement to restore the organized market. Wall Street also has a fresh incentive to that end in the revival of the demand for Government regulation of the Stock Exchange as a precedent to its reopening. The banking and brokerage community are likely to go to considerable lengths to demonstrate that governmental intervention can be dispensed with.

London	23⅛	23	22 15-16	22 13-16	22 13-16	22 11-16

COTTON

October 24, 1914.

AN account of what has happened this week in respect of cotton in the United States would read not dissimilarly from one of the official bulletins of events along the battle line in Belgium and France, as given out by the French and British war intelligence offices. For the most part the applicable phrase would be: "No change has occurred"; and yet certain evidence of the steady work of attrition might be discernible here and there. Little by little ever since the 6½-cent level was reached in the interior local markets of the South, the price of cotton has yielded under the weight of the offerings, diminished though these have been by the resolution of the more thrifty farmers in not selling their cotton for the present. The very heaviest portion of the ginning season is now here; and, were external conditions normal, the South would be selling from 100,000 to 150,000 bales of cotton a day. The purchasers of this cotton would be merchants of every degree of skill and financial resources, each one of whom would be taking his daily quota of cotton, and either selling it at once to some spinner at home or abroad, or protecting himself against loss by hedging on a cotton exchange. The banks would be gladly loaning the money required to finance the cotton, even though the price were twice as high as it now is; and they would be doing this without Government aid and without requiring access to a credit fund of $150,000,000 or of any other amount. But today, unhappily, the banks are hesitant about lending the money of their depositors on cotton, however low the price, because they know that merchants have no insurance against a still further decline in price and because they have never had any real experience with lending money on cotton to anybody but merchants. The daily output of the cotton gins meantime is added to an already unwieldy load, while the means are lacking for distributing this load, either over the world at large through exports, or over the future through the use of contracts for future delivery bought and sold on the exchanges. Hence all efforts, all projects and all oratory cannot prevent the price of cotton from slowly declining in the South. This week the lowest prices since 1897 and 1898 were again seen, numerous quotations of sales at 5½ cents per pound and some even at 5 cents per pound in the interior being reported. The panacea of the eloquent friends of cotton has not yet been found. Those despised bodies, the cotton exchanges, however, have made real progress during the past week towards consummating their work of repair and of preparation for the resumption of their economic function. The New York Cotton Exchange, particularly, has visibly begun to near the goal of readiness to resume operations. Long since, the task had been completed of concentrating into the single month of December the tangled mass of future contracts bought and sold for all the months from August, 1914, to May, 1915; of reducing thereby to the lowest possible proportions the commitments of members one to the other; of liquidating, in this way or that, a multitude of "distress" contracts; and of bringing the entire internal problem of the Exchange into compact and intelligible shape. During the past week the intricate and vexatious adjustment of the form of contract to the terms of the so-called Lever Act,—a law which nobody in Washington understands and rulings under which are still postponed by the Secretary of Agriculture,—was completed, by the adoption of revised by-laws and rules, under which the new trading can be conducted as soon as it begins. The demonstrated insufficiency of the commission charges, which the experience of the past three months had harshly shown to be inadequate to the risk, has been remedied by an increase of the commission rate for members from $7.50 to $10 per 100 bales (round turn), and from $15 to $20 for non-members. Floor brokerage has also been increased from 75 cents to $1 per 100 bales. Finally, a co-operative plan for relieving the pressure upon many members and member firms occasioned by contracts on their books bought before the outbreak of war for the account of now inaccesible foreign customers or for reluctant and in some cases defiant American customers, has been brought within plain sight of consummation. Here the generosity and self-sacrifice of the more fortunate members of the Exchange and the readiness of important New York banks to assist in a work meaning a renewal of sound business activities, have merited the warmest gratitude and the sincerest praise on the part of all the members of the American cotton trade, within and without the New York Cotton Exchange. Great skill and great resolution have been required to accomplish what has been done in this matter. Finally, there are reasonable prospects that no inconsiderable part of the damage done and of the loss occasioned by an important failure in the New York market, on the very day of the closing of the Exchange, may shortly be brought into process of repair, and many members placed thereby in a position better by so much than they had had reason to expect. Without undue optimism, it is hoped, it may be expected that another fortnight will find these many restorative efforts and plans brought so nearly into a rounded whole that without apprehension the New York Cotton Exchange may take up again its great office of bringing together the buyers and sellers of cotton, so that producers may find again a calculable market, while manufacturers and merchants may gradually enlarge their commitments, and in the process both relieve the pressure of surplus cotton and restore the credit of cotton with those whose business it is to employ the funds entrusted to their care in a helpful, yet prudent way,—the bankers of the North and of the South.

THE CONTRACT MARKETS

THE NEW YORK COTTON EXCHANGE.

The following were the high, low and closing bid prices for each delivery, on Friday, July 31, in cents and hundredths of a cent per pound, gross weight:

	July 31.	Mon.	Tues.	Wed.	Thurs.	Fri.

The MOVEMENT OF THE AMERICAN CROP.

The American crop year has been changed to run from August 1 to July 31, and all comparisons are made up accordingly.

The following tables, derived from the New York Cotton Exchange, show the movement of the American cotton crop for the past week and since August 1, 1914, with comparisons for previous years:

CROP MOVEMENT INTO SIGHT.

Weekly Movement.	1911-12.	1912-13.	1913-14.	1914-15.
Port receipts	491,655	520,047	499,905	245,914
Overland to mills and Canada	26,854	28,406	43,783	30,123
So. mill takings, est., exclusive of takings from Southern ports.	85,000	85,000	85,000	60,000
Gain of stocks at interior towns	72,052	49,304	66,468	107,606
Brought into sight for week	675,561	682,757	695,156	443,643
Total Movement—				
Port receipts	3,329,790	3,094,960	3,147,285	1,063,554
Overland to mills and Canada	94,381	79,194	137,172	64,513
Southern mill takings..	567,032	540,873	579,796	288,000
Stocks at interior towns in excess of Sept. 1..	421,351	324,015	317,690	510,463
Brought into sight thus far this season	4,412,554	4,039,042	4,181,943	1,926,530

The total crop movement is respectively for 88 days, 86 days, 85 days and 84 days.

NEW YORK STOCK OF INSPECTED COTTON

The following table, posted by the New York Cotton Exchange, gives the quantities and grades of cotton in warehouses in the Port of New York on September 9, 1914, inspected, classed, certified and grade guaranteed by the New York Cotton Exchange; also the differences "on" or "off" the basis middling price at which these grades are delivered on contracts:

No. of Bales.	Grade.	Cents.
..	Fair	.70 on
5	Strict middling fair	.63 "
16	Middling fair	.56 "
5	Strict good middling	.42 "
4	Fully good middling	.35 "
2	Good middling	.28 "
4	Barely good middling	.21 "
96	Strict middling	.14 "
159	Fully middling	.07 "
807	Middling	Basis
753	Barely middling	.25 off
5,013	Strict low middling	.50 "
7,148	Fully low middling	.85 "
11,711	Low middling	1.25 "
9,604	Strict good ordinary	2.00 "
662	Good ordinary	3.00 "
12	Strict good middling tinged	.14 "
220	Good middling tinged	Value of Mid.
1,189	Strict middling tinged	.20 off
3,001	Middling tinged	.40 "
2,828	Strict low middling tinged	1.25 "
283	Low middling tinged	3.00 "
213	Middling stained	1.25 "
43,735	Inspected, but not classed, 198 bales.

The Extension of Cotton Growing in Portuguese West Africa.—From reports of Harry A. McBride, United States Consul at Boma, Belgian Kongo, it is possible to give the following details of the work of the Portuguese Government in developing the growing of cotton in its African possessions. Angola is the largest Portuguese colony in Africa, the area being 484,700 square miles, or more than three times that of the State of California. It lies wholly within the Tropical Zone, the range of latitude being 5° to 17° S., and is bounded on the north and northeast by the Belgian Kongo, on the

southeast by Rhodesia, and on the south by German Southwest Africa. The east line on the Atlantic, from the mouth of the Kongo River to the mouth of the Cunena River, is 1,027 miles in length, roughly approximate to the coast line from Portland, Me., to Charleston, S. C.

Although cotton grows in many parts of Angola, where some species are indigenous, it has never been cultivated extensively. The Government is anxious that cotton growing should be taken up and, in 1906, the Governor General was authorized to grant concessions up to 2,500 acres, upon payment of 1 cent per acre for the land. After one-fifth of the concession was under cultivation the payment was to be refunded to the planters. For a period of fifteen years from 1906 all machinery and materials for the plantations were to be imported free of duty and no taxes of any kind were to be levied on the property. Moreover, a premium that would equal the freight charges and export duties was to be paid on all cotton exported to Portugal. Exports to foreign countries were to receive only a reduction of 15 per cent of the export duty. Notstanding these inducements no important concessions were taken up. The entire territory from Benguella to Porto Alexandre has been pronounced suitable for cotton cultivation as to both climate and soil, and the district of Mossamedes is also favorable.

Now that the rubber trade is rapidly decreasing, even greater efforts are being made to create interest in cotton growing. Natives near the coast have been compelled to plant cotton, each hut to have at least one acre, and native police visit and control the cultivation. The native population is small, however, and the villages scattered, the tilling is done in most primitive fashion, so the results are not likely to be of importance. The Government imports seeds from America and Egypt, which are distributed gratis to the natives and at cost price to others, and has also introduced gins and baling presses. A premium of $15 per acre is now being paid to all who cultivate more than two acres of cotton.

With this assistance a few small plantations have been started along the Benguella Railway, one of them covering 375 acres. Duarte, Almeida & Companhia own small plantations at San Nicolau and Mossamedes. In the latter location the production reaches 220 pounds of cotton per acre. The company has been in operation about four years, has exported fifty tons of its product, and now has about 2,000 acres under cultivation.

The seeds furnished by the Government are chiefly of the upland and sea island varieties, these giving the best results. A German engineer endeavored to introduce the Caravonica species (Australian tree cotton) but the experiments appear to have been a failure.

NEW YORK QUOTATIONS FOR STANDARD COTTON GOODS AND YARNS

The following are quoted prices in the New York market for typical standard cotton goods (in cents per yard) and cotton yarns (in cents per pound) on Saturday of last week and on Wednesday of the present week:

Cloths.	Saturday.	Wednesday.
Print cloths, 28 in. 64 x 64s	3	3
Gray goods, 38 in., standard	3⅞	3⅞
Brown sheetings, Southern standard	7¼-7½	7¼-7½
Denims, 9-ounce	13½-17	13½-17
Tickings, 8-ounce	13	13
Standard prints	5¼	5¼
Standard staple ginghams	6¼	6¼
Yarns.

THE NEED OF STANDARD COTTON WAREHOUSES FOR THE CARRYING OF OUR SURPLUS COTTON

By Ira G. Hoagland
Formerly Editor of "Safety Engineering"

COTTON, because of the strictures imposed on international commerce by the European War, menaces the stability of domestic affairs quite the same way as mighty rivers threaten the security of border territory in flood times. One certain method of controlling swollen rivers is to impound the flood waters and then drain the impounding reservoirs gradually. The most certain methods of controlling the possible flood of cotton and the disaster that would surely follow the flood is to "impound" the cotton. At the conference in Washington, August 24-25, called by the Secretary of the Treasury to discuss cotton relief plans, Mr. H. R. Eldridge, vice-president of the National City Bank of New York, said:

> "We have reason to expect, in view of the present favorable outlook of production in the Cotton Belt, that a crop of from fourteen to fifteen million bales of cotton is before us; and we know that approximately two million bales of the past year's American crop remain in the visible supply of American cotton, not yet taken, much less consumed by the world's spinners. The belief of well-posted men in the cotton trade is that the world's consumption of the American crop this season, under prevailing conditions, will be a minimum of 11,000,000 bales and a maximum of 13,000,000 bales. Averaging these figures, an actual surplus of 4,500,000 bales is in prospect; and so long as no provision is made for eliminating it from the supply and demand situation, for the time being at least, that surplus will be a menace to the market and must prove a serious handicap to the hope that even a living price can be realized by the producer for his cotton.
>
> "It therefore seems evident that, if the almost unprecedented situation in which American cotton is now found, by reason of causes beyond our control, is to be saved from great demoralization and heavy losses to the country and the cotton producers, some 30 per cent of this season's production must be removed from the present market and carried over to the next season; and that it must be accomplished in such a convincing way as to cause spinners to realize that the undoubtedly heavy surplus will not longer be a menace to the market, while the abnormal conditions in the cotton manufacturing industry of the world continue. Under the old order of things, paper secured by cotton and many other commodities was rarely presented on the market in such form as to command the respect of investors; and it cannot be so presented this season, unless conditions are changed in certain respects. One essential to this end is a uniform warehouse receipt of undoubted integrity. As things are now, such warehouse receipts are few. Where it is deemed necessary to improve the standing of warehouse receipts, warehouses making application to the proper authorities should be governmentally licensed under regulations to be established, and each warehouse so licensed should be supplied with a Government inspector who should issue a uniform receipt for each bale of cotton, or other form of package representing a commodity stored, certifying thereon the mark, the weight and the grade. This system would create a form of security good beyond peradventure, and one that would command the respect of all bankers and investors everywhere. Each obligation issued should be accompanied with a certificate of insurance, issued by a reputable insurance company, indemnifying the holder against loss by fire of the collateral pledged."

Mr. Eldridge described comprehensively both the cotton problem and a practical relief plan. A bill providing for the licensing of cotton warehouses by the Secretary of Agriculture and the issuing of government warehouse receipts to facilitate the granting of bank credits on stored cotton was introduced in the Senate by Senator Smith, of Georgia, and passed after being loaded with amendments to include naval stores, tobacco, grain and canned salmon. A substitute measure, the Lever United States warehouse bill, was introduced in the House of Representatives. This provides for the licensing of agricultural warehouses containing nonperishable agricultural products. The licensed warehouse certificates would be negotiable and would warrant the issue of emergency currency. Action on this bill has been defeated for the present session of Congress.

The only immediate relief actually in sight is in the emergency currency plan proposed by the Secretary of the Treasury. As of August 27, 1914, Secretary McAdoo said:

> "Among the eligible securities to be used as a basis for the issue of currency I have decided to accept from National Banks through their respective National Currency Associations, notes secured by warehouse receipts for cotton or tobacco, and having not more than four months to run, at 75 per cent of their face value.
>
> "It is not my purpose to prescribe the character of warehouses in which cotton and tobacco may be stored. The banks will be relied upon to see that warehouse receipts issued by responsible warehouse men or warehouse companies alone are accepted, and that the cotton and tobacco stored in such warehouses is covered by adequate fire insurance and is protected against injury by the elements."

A special committee appointed by Secretary McAdoo, pursuant to resolutions adopted at the conference of cotton and tobacco growers, manufacturers and exporters, held at Washington, August 24-25, 1914, reported among other things, the following:

> "That it is the sense of the committee that cotton, tobacco, and naval stores should be marketed as deliberately as possible until they can again be exported in normal quantity and that, when properly conditioned, should be warehoused with responsible concerns; that they should be protected against weather damage and be properly insured against loss or damage by fire.
>
> "That warehouse receipts for these commodities are proper collateral for loans by banks, and should be so accepted, with such limitations as to margin, inspection, and valuation as conservative bankers may each in their discretion see fit to impose.
>
> "That cotton does not deteriorate when properly warehoused, and is as good twenty years after it is picked as when it is first gathered; that it can therefore be carried over until the restoration of normal business conditions enables the world's consumption to absorb it.
>
> "Your committee recommends that notes having not longer than four months to run, when secured by proper warehouse receipts for the aforesaid commodities, properly insured, be accepted for rediscount by the Federal Reserve Banks, when organized, and that they also be approved by the National Currency Associations as security for additional circulation to the National Banks under the provisions of the

Aldrich-Vreeland Act as amended by the Federal Reserve Act."

But the banks of the South are not giving the aid fondly expected by the promoters of the warehouse-receipt-emergency currency plan. Several explanations for this caution have been advanced. None of them consider that it might have been too much to ask of bankers that they assume the responsibility of issuing currency without definite knowledge of actual cash values and at the same time guarantee the integrity of warehouse receipts. Recently a bill was introduced in the House of Representatives which is designed to force National and State banks to make loans to owners and producers of cotton, the loan notes to be secured by warehouse and insurance receipts.

Delegates from eight Southern States at the Southeastern Cotton and Food Products Conference, held recently in Atlanta, agreed that the cotton problem should be solved by the States and that it would be unwise for the National Government to interfere. In the debate in the Senate on the licensed cotton warehouse bill, introduced by Senator Hoke Smith, this point was remarked by Senator Lippitt, of Rhode Island. The Senator said:

> "Why is it not feasible for the respective States in the South to issue their own certificates for this purpose, instead of having the National Government undertake to comply with a purely local need?"

Senator Smith did not see it that way. Even then the Texas Legislature, having convened in a special session, was considering just such a plan. A bill providing for the State supervision of cotton warehouses and the endorsement of warehouse receipts was put through and signed by the Governor. This is an emergency measure and terminates August 31, 1915. A permanent warehouse bill is under consideration.

The Commissioner of Insurance and Banking is the State official in charge of the administration of the Texas emergency warehouse law. He issues warehouse licenses, makes rules for operation of warehouses and appoints managers for them, has regular inspectors to inspect warehouses. The Commissioner may lease buildings and establish warehouses where local enterprise is lacking. The law emphasizes provisions for both insurance against loss by fire and for actual physical protection against fire.

Surety companies operating in Texas propose to bond cotton warehouses and guarantee storage receipts. An individual surety company is doing it in other States. A warehouse receipt, guaranteed by the company, becomes available collateral and facilitates financing the cotton. The company will protect itself by requiring warehousemen to store in separate compartments all cotton represented by guaranteed receipts, and to keep these compartments locked.

Relief plans are legion. Cotton farmers suggest that the Government buy cotton outright and "warehouse" it until the market is better. Cotton Congressmen proposed a plan for a direct loan of $500,000,000 to planters on warehouse receipts for cotton. A plan to issue $250,000,000 in State bonds by nine cotton States was submitted recently to a conference of the Governors of these States. The proceeds from the bond issue would be used to purchase and store 5,000,000 bales of cotton. Arthur R. Marsh, ex-president of the New York Cotton Exchange, urges loans on cotton or immediate purchases by consumers on the basis of deferred deliveries.

A plan for raising a cotton loan fund of $150,000,000 was ratified recently in St. Louis by a delegation of cotton States bankers. Newspapers contain reports of assistance given to cotton growers by some local banks in financing the picking and ginning of cotton and taking the cotton in the warehouse as collateral security. A surety insurance company announced that it would purchase and store cotton if the Government would accept that as an asset. Secretary McAdoo said that he would approve cotton as an asset. Commercial paper secured by State warehouse receipts as an investment has been approved in Texas. National banks are allowed to count a certain amount of cotton among assets.

St. Louis banks have accepted cotton "properly warehoused" as collateral security to the extent of $35 per bale. "Cotton properly shedded and insured, is our best asset, and is good collateral for credit," said the president of the Dallas Credit Men's Association. The Galveston Commercial Association urges retail merchants to advance cash to farmers for cotton picking and hold cotton in "secure warehouses" as collateral against existing indebtedness. And cotton is accepted as currency in some places. Notes secured by warehouse receipts will be accepted in payment of premiums by one New Orleans life insurance company. The heart of the public is reached in the "Buy-a-bale-of-cotton" movement. In commenting on a systematic manner of handing this proposition Governor Colquitt, of Texas, said:

> "Some friends of mine in St. Louis have sent me their checks with which to buy a number of bales of cotton at 10 cents per pound and hold them for their account. I shall purchase them as instructed, place them in a State guaranteed warehouse and send them the receipts with the State's guarantee that the cotton, which will be under bond and insurance, will be forthcoming when the holders of the receipts demand it."

"Hold cotton; sell sparingly when demand is forced," says a prominent cotton man. That is the essence of the relief plans; that is "impounding" the cotton deluge, just as the engineer would impound the flood waters of a mighty river. The warehouse is the cotton "impounding reservoir"; it is the all-important factor in the plans for financing the holding operation. "Without being able to properly house and safeguard the cotton to be held," says the Memphis "News Scimitar," "there will be no success in the efforts to get money from the Government or anybody else." And there has not been. Banks have been cautious with emergency currency, and for good reasons. It would be folly to issue emergency currency on physically unsafe cotton; yet there are legislators who would force banks to do what reason forbids.

The cotton warehouse is the basis of all relief plans. But the lack of warehouse facilities is in about the same proportion as the need for them. At the cotton conference in Washington, H. Q. Alexander, of North Carolina, said that there were not sufficient warehouses in the country to store one-third of the crop. Texas, the premier cotton producer, "has such limited warehouse facilities that they are almost negligible," observed "Cotton and Cotton Oil News." "But they can be provided in large degree within sixty days." So they can, of a sort. "It has not been a practice to store cotton in warehouses in this State," says a prominent Oklahoma fire insurance official. "We only have one large cotton warehouse in the State." The following comment was made by the "Atlanta Constitution":

> "If to-day there existed throughout the Cotton Belt a chain of duly accredited warehouses bonded and under adequate supervision as to grade, etc., the problem that now faces the farmer would be half solved. Certificates representing cotton thus stored would be negotiable instruments, or could be made so, throughout the world. There would be no excuse for the dalliance of Congress in emergencies like

that now confronting us. There would in all likelihood be no such troublesome specter as distress cotton.

"Texas has recognized this salient truth. According to reports, that big cotton-growing Commonwealth is preparing to erect a system of warehouses capable of holding all the distress cotton that may be offered."

Evidently, the "Constitution" is unaware of the fact that Georgia has the most and best cotton storage facilities of any of the cotton States. Georgia has nothing to learn from Texas as far as cotton warehouses are concerned. Georgia is one State in the Cotton Belt which has sufficient storage capacity for distress cotton. A census of the warehouses in the State revealed a storage capacity of 1,000,000 bales, about 40 per cent of the State's crop. A considerable proportion of this capacity is in really standard warehouses, equipped with automatic sprinklers. South Carolina is another State well endowed with warehouses, in which the aggregate storage capacity is about half a million bales. And many of the warehouses are equipped to control cotton fires with automatic sprinklers. In fact, these two States have fully 75 per cent of all of the sprinklered public cotton warehouses in the cotton States, yet their combined proportion of crop yield is much less than that. Moreover, it is not extreme to say that the cotton States have been benefited more than once by the Georgia and South Carolina warehouses. When Texas, Alabama and Mississippi have been rushing cotton to market, Georgia and South Carolina have been quietly filling their "impounding reservoirs" and "stemming the flood." Alabama comes next in the number of standard sprinklered public warehouses; Tennessee and Mississippi follow, and Texas, the chief producer of all, has only a few.

"We in New England would gladly welcome—the users of cotton all over the world would gladly welcome—some new method of storing cotton in the South," said Senator Lippitt, of Rhode Island, in the debate with Senator Smith, of Georgia, on the cotton warehouse bill. And here is an echo from "Old England." Sir Charles Marcara, president of the International Federation of Master Cotton Spinners' and Manufacturers' Association, in a letter to A. S. Terrill, chairman, United States Lumber and Cotton Company, Chicago, remarked:

"On the occasion of the tour of 120 cotton spinners and manufacturers of all nationalities, which I led in 1907 through the cotton-growing States of America, it became evident to me that in years of exceptionally large cotton crops it would be in the interests of the millions of cotton producers and cotton-mill operatives that a scheme for properly packing and warehousing the surplus cotton crop should be initiated, and in view of the certainty that there will be an enormous surplus in this year's American cotton crop, such a scheme undertaken by the Government of the United States of America would be a safeguard against dire calamity."

"Anyhow, the war will have procured a needed supply of cotton warehouses for the South," observes a commercial journal. A supply will be procured, but it will be far removed from a "needed supply." Those who know the needs of the South know that quality as well as quantity is needed in cotton storage facilities. There will be quantity enough, no doubt. In a month's time Texas multiplied its storage capacity five times, built enough new warehouses to care for 1,700,000 bales of cotton, according to news reports. State departments worked overtime granting charters for warehouse companies. Oklahoma was similarly enterprising; it had to be; it had only one warehouse to begin with—Texas had seventeen. "The Southern towns and cities are pushing the work of providing warehouses for cotton under what may be termed the McAdoo plan," says a newspaper report. "Suggestions are being made, however, that these warehouses should be as inexpensive as possible consistent with due preservation of the cotton from injury by the elements."

"It is not my purpose to prescribe the character of warehouses in which cotton and tobacco may be stored," said Secretary McAdoo at the cotton conference in Washington. "The banks will be relied upon to see that the cotton and tobacco stored is covered by adequate fire insurance and is protected against injury by the elements," and the lack of emergency currency shows that the banks can be relied upon. A $50,000,000 corporation organized to construct cotton warehouses will build structures "composed of an eight-foot wire fence with a floor and a covering to keep off the weather." An insurance man in Oklahoma says that "a number of skeleton iron-clad warehouses" will be built and that both brick and wooden vacant mercantile buildings will be used. "In nearly every town we may find some building that will do for storing cotton, even if no regular warehouse exists, and if not too near the centre of trade, the rent should not be too high," observes a Texas trade paper. But the Texas emergency warehouse law will stay such foolishness as that. The law makes provisions for fire insurance and actual physical protection against fire which will control to a degree indiscriminate and unsafe storage.

Senator Lippitt, in discussing Senator Smith's warehouse bill, said: "It does not seem to me that the Secretary of Agriculture would be likely to approve or to certify such a storehouse as the Senator described. Of course if he is going to give his approval to a storehouse it must be a building that is efficient from all of the aspects of the case. I do not suppose this bill * * * means any flimsy or temporary structure." Mr. Smith interposed with the information that the bill provided for all sorts of warehouses. The nature of the warehouse enterprises, remarked in the preceding paragraph, showed that all sorts of warehouses, principally the flimsy variety, are being provided in the South. And it is clear that little or no consideration has been (nor is being) given to "a building that is efficient from all the aspects of the case."

Proponents of certain relief measures have calmly ignored the economics of the holding proposition. Insurance and weather protections have been offered as sufficient specifications for security. Weather protection is a simple matter and can be secured with a flimsy structure. "Insurance protection" in a flimsy structure is expensive. But insurance will not extinguish fires; it is a tax, not a protection; the cost of the tax is always in proportion to the hazard, and the fire insurance companies understand the hazard better than anyone. Therefore the advocates of relief plans involving flimsy warehouses took rather too much for granted in giving assurances of insurance "protection." An insurance newspaper in commenting on conditions in warehouses in a large cotton city said: "Some companies do not look with favor upon cotton insurance under the present conditions, and are asking their agents not to interest them in any of the class." Insurance companies, that is the sound institutions, are not taking chances on the doubtful cotton risks. Moreover, they are adopting the sound precaution of insuring cotton by individual bales according to marks and numbers, and at the market price per bale; also reserving the right to replace burned cotton with other cotton of similar character. In communicating these requirements to the executive committee of the National Currency Association of Dallas, a committee of local insurance men said: "These requirements are made necessary by reason of the effect of the European War upon insurance and the absence of a regular market, and further the re-

duction in facilities for writing cotton which have been obtainable in the past."

Then there is the brand new fire hazard caused by the popular "Buy-a-bale-of-cotton" movement, which the originators of that movement did not reckon with. It is reported that this is worrying the Texas fire insurance commission because of the increased fire hazard caused by the storing of bales in front of large buildings and many places of business. The bales are taken care of in the rates, but the adjacent property is not. Some few merchants roll their bales into their stores at night, and this is absolutely forbidden by their policies. Such act really voids the policy, but the question has not arisen as yet. No fires in stores have occurred up to this time, though several bales have burned on the sidewalks. They were pushed into the streets and no danger resulted. The bales are splendid targets for the street urchins and cigarettes. The "Buy-a-bale" proposition is all right if the cotton is properly stored. Otherwise it may result unhappily in property, and perhaps lives, destroyed by fire.

Estimates of the amount of cotton it will be necessary to "impound" in order to maintain a good market price for the staple range from 3,000,000 to 9,000,000 bales. An estimate of 4,000,000 bales was made by a competent cotton specialist. Government reports forecast a 1914-1915 cotton crop of over 15,000,000 bales. In a normal season possibly 40 per cent of the crop is stored for a period of four months. This would mean that 6,000,000 bales of the 1914-1915 crop would be in storage four months, if conditions were normal, and as they are not it will be considered that one-third of that amount will be stored three times as long, or 2,000,000 bales for twelve months. This amount plus the "impounding" estimate yields a total of 6,000,000 bales to be stored twelve months; 6,000,000 bales of the trickiest and most susceptible merchandise of commerce, as far as fire is concerned.

The importance of warehouses in the holding operation has been emphasized. The lack of suitable warehouses will mean an enormous economic waste in the holding operation. Consider what this will mean in one respect,—cost of fire insurance. There are 6,000,000 bales of cotton to be stored, which will be done in two kinds of warehouses, those equipped with automatic sprinklers and those not. It will be assumed that sprinklered warehouses will accommodate 1,000,000 bales. Thus, 5,000,000 bales will have to be stored in all sorts and sizes of warehouses, secure and otherwise, mainly otherwise.

The insurance rates on unsprinklered warehouses and sheds in Texas range from 1.38 to 5.63 per cent. The standard warehouse takes a basis rate of 1 per cent, but deficiencies may run individual rates up to 6 per cent. The iron-clad structures going up in Oklahoma will be rated low at 3 per cent. Several weeks ago the "Manufacturers' Record" published an article, "Cheap and Safe Storage of Cotton," in which was described a cotton storage scheme devised by W. G. Turner, vice-president of the Memphis Terminal Company. The scheme comprises groups or clusters of wooden-frame roofing-paper-clad warehouses. Cheap, to be sure, but safe, assuredly not. The article quotes an "announced insurance rate" of 1.50 per cent on cotton in these "warehouses." According to the description, these "warehouses" would rate about 2.70 per cent in States adjoining Tennessee, and they wouldn't "go" in Texas without adequate fire protection, under the emergency warehouse law. Moreover, these "warehouses" would cover nearly six times the real estate necessary for standard warehouses.

Average rates in unsprinklered cotton storage obtained from conservative fire insurance companies who are underwriting, very cautiously, on cotton risks, range from 1.75 to 2.25. In view of the high and low figures quoted in the preceding paragraph and the averages in this it is reasonable to consider that 2 per cent is a conservative average rate on unsprinklered cotton storage. At 10 cents a pound, the "Buy-a-bale" price, 5,000,000 bales of cotton would be worth $250,000,000. If this amount were insured at 2 per cent the premium would be $5,000,000.

On sprinklered cotton storage rates are as low as 0.15 per cent, and 0.2 per cent is conceded to be a fair average. Thus, the insurance on the 1,000,000 bales in sprinklered storage will cost $100,000—only one-fiftieth the cost on one-fifth the number of bales in unsprinklered storage.

The difference between the unsprinklered average rate and the sprinklered average rate is 1.8 per cent. On $250,000,000 this would mean $4,500,000, a considerable sum, and a sum which represents the interest at 6 per cent on $75,000,000, an amount sufficient to buy 1,500,000 bales of 10-cent cotton!

The neglect of the owner of cotton to select a sprinklered warehouse may cost as much as $3 per bale more in insurance and certainly an average of 90 cents per bale more than in a sprinklered warehouse.

Now, the sort of warehouse in which cotton can be insured as low as 15 cents per $100 is a simple structure of brick and wood, separated into several fire divisions, each of limited size. The brick is used in the fire walls separating the sections and the wood in the roof and end walls. The specifications for such a warehouse are, in brief, as follows:

Capacity.—Not over 1,000 bales in any compartment, stored one high on ends.

Division and Side Walls.—Brick, at least 16 inches thick, parapetted above roof, also extended beyond end wall lines at least three feet. Side wall may be 12 inches thick.

End Walls.—May be of wood, clapboards nailed to posts, spark and weather tight. When exposed these walls to be brick.

Floors and Platforms.—Preferably concrete.

Roof.—Two or three-inch planks on heavy timbers eight to ten feet apart; cover, gravel or tin.

Doors.—As many as possible in end walls, hung securely in pairs and made draft and spark tight. Doors to be standard tin clad when in brick walls.

Ventilation.—One or more spark-proof ventilators in each section.

Lighting.—If any, to be incandescent electric, wired according to the National Electrical Code.

Sprinklers.—Each section to be equipped with automatic sprinklers installed in compliance with the National Standard Sprinkler Requirements.

Hydrants, Etc.—A standard outside system of hydrants and hose.

Considerable comment is current about "fireproof" cotton warehouses of corrugated iron or wooden studding, floored with concrete. The character of the construction of a cotton warehouse has little or nothing to do with safeguarding cotton against fire other than limiting the quantity subject to one fire, and, of course, protecting against exposure. A fireproof warehouse will not "fireproof" the cotton, whereas automatic sprinklers will, in any kind of a warehouse.

The cost of insuring against fire for one month, one bale of 10-cent cotton in the sort of warehouse described would be .0062 cents—nearly half a cent. The cost per bale per month in the average sprinklered warehouse would be .0083 cents, still under 1 cent. In the average unsprinklered warehouse the cost per bale per month would be .083 cents—nearly 10 cents.

Warehouse charges, including insurance, vary considerably. The executive committee of the New Orleans "Buy-a-Bale" Club figured

warehouse charges for twelve months as follows: Storage and handling, first month, 25 cents per bale; for 11 months, at 8 cents, 88 cents per bale; weighing and labor charges for removal, 8 cents per bale; insurance for twelve months, approximately 50 cents per bale; total charges, $1.71 per bale. A Galveston warehouseman charges $1 a bale for the first month, which includes commission, storage and insurance charges, and afterwards 30 cents per bale per month for storage and insurance; total charges per bale per year, $4.30. "Ours will be a bonded warehouse," advertises another warehouseman. "The cost of insuring and storing cotton will be 15 cents per bale per month." Another announcement reads: "We have standard warehouses. The carrying charges for each bale of cotton is 25 cents per month for storage and insurance." A rate of 15 cents per bale per month for storage in standard warehouses would yield a saving of at least $3,000,000 on 5,000,000 bales of cotton.

But the standard warehouse not only lowers the fire insurance and storage rates; it also lowers the money-lender's rates. Careful lenders prefer to loan money at a low rate, say 6 per cent, on good risks. Lenders, not so particular, who hazard loans on cotton in substandard warehouses may ask 8 per cent. Therefore, standard warehouses would yield a further saving of possibly $5,000,000.

Economists estimate that there is an annual waste in handling the cotton crop of approximately $100,000,000. It would not be extreme to say 5 per cent of this is due to physical damage resulting from improper storage. Thus $5,000,000 more is added to the economic waste of the holding operation without proper storage facilities.

The total cost of holding 5,000,000 bales of cotton without adequate and proper storage facilities will be at least $17,500,000, which would almost pay 6 per cent interest on $300,000,000, a sum sufficient to quite effectively stabilize the cotton situation, and almost, if not quite, build enough sprinklered cotton warehouses to house 5,000,000 bales of cotton.

Assuming that $17,500,000 would give sprinklered cover to 5,000,000 bales of cotton, and that the combined warehouse and insurance charges were 15 cents per bale per month, that investment would yield 8 per cent after deducting the fixed charges for storage, insurance and interest.

Is it not clear that all of the cotton States should have a well-organized system of standard sprinklered cotton warehouses?

INDUSTRY, COMMERCE AND FINANCE

(Continued from Page 522.)

ada, Argentina and British India which aggregated 200,000,000 bushels; the United States and Australia produced together 140,000,000 bushels more this year than last. In view of the general shortage in the world's production of wheat in 1914, it is exceedingly fortunate that the United States will have, according to the Department of Agriculture's estimate, no less than 290,000,000 bushels for export, as compared with 141,000,000 bushels actually exported in 1913. Of the total crop harvested in the United States,—892,000,000 bushels,—the Department estimates that 525,000,000 bushels will be required for food and 77,000,000 bushels the seed for the coming crop, leaving, as just said, 290,000,000 bushels for export. The largest quantity of wheat ever exported from the United States in one season heretofore was 235,000,000 bushels, in 1901.

* * *

Street and Electric Railways in 1912.—The Bureau of the Census has issued bulletin No. 124, including statistics for street and electric railways for the year 1912, covering all railways other than steam roads in operation in the United States during any portion of the year. Comparative statistics are also shown for the censuses of 1907, 1902 and 1890. The statistics for electrically-operated divisions of steam roads are included only in cases where full reports could be made therefor separate from those for steam road operation. In the case of electric railway companies selling electricity for lighting and industrial purposes, when it was impossible to obtain complete, separate reports for the railways and for the electric light and power operations, data for both branches are included in the report for the railway. Comparisons for different censuses are to some extent affected by the inclusion of incomplete or estimated reports. The principal statistics are shown in the following comparative summary:

Business Failures in Great Britain in 1913.—The annual report by the British Board of Trade under Section 131 of the Bankruptcy Act, 1883, states that the receipts on account of bankruptcy proceedings during the year ended March 31, 1914 (stamps, fees and dividends on funds invested), were £113,029, while the expenditure (salaries, remunerations to county court registrars, etc.) was £149,743. During the year 1913 the number of receiving orders under the Bankruptcy Acts, 1883 and 1890, was 3,358, a decrease of 223. The liabilities, as estimated by the debtors, were £5,091,265, an increase of £177,315. The assets, as estimated by the debtors, were £1,790,463, a decrease of £36,647, and the estimated loss to creditors was £4,494,444, an increase of £189,531. Under the Deeds of Arrangements Act, 1887, the number of deeds in 1913 was 2,411, a decrease of 359, the liabilities, as estimated by the debtors, were £1,512,919, a decrease of £141,634, and the estimated loss to creditors was £1,858,178, a decrease of £289,080. On comparison of the 1913 figures with those for 1912, out of 88 trades or occupations 38 show an increase of liabilities amounting to £1,307,995, while 50 show a decrease amounting to £1,509,131. The largest aggregate liabilities are shown in the case of builders, with a total of £404,279; but this amount is less than the corresponding figures under the same trade heading for 1912 (£467,000) and considerably less than in 1911, when the amount was £864,000. The liabilities of stock brokers amounted in 1913 to £397,800, as against £123,400 in 1912, an increase of £274,400.

CONDITION OF UNITED STATES NATIONAL BANKS ON SEPTEMBER 12, 1914.

Following is an abstract of the reports of National banks of the United States as made to the Comptroller of the Currency in response to his call for condition as of September 12, 1914, as compared with his previous call, June 30, 1914, and the corresponding call of a year ago, August 9, 1913:

RESOURCES.

Atlantic Mutual Insurance Company

ATLANTIC BUILDING

51 Wall Street, New York

INSURES AGAINST MARINE AND INLAND TRANSPORTATION RISK AND WILL ISSUE POLICIES MAKING LOSS PAYABLE IN EUROPE AND ORIENTAL COUNTRIES.

Chartered by the State of New York in 1842, was preceded by a Stock Company of a similar name. The latter Company was liquidated and part of its Capital, to the extent of $100,000, was used, with consent of the stockholders, by the Atlantic Mutual Insurance Company and repaid with a bonus and interest at the expiration of two years.

During its existence the Company has Insured property to the value of	$27,219,045,826.00	
Received Premiums thereon to the extent of		$282,298,429.80
Paid Losses during that period	$141,567,550.30	
Issued Certificates of Profits to dealers	$89,740,400.00	
Of which there have been redeemed	$82,497,340.00	
Leaving outstanding at present time	$7,243,060.00	
Interest paid on Certificates amounts to	$22,585,640.25	
On December 31, 1913, the Assets of the Company amounted to		$13,259,024.16

The profits of the Company revert to the assured and are divided annually upon the premiums terminated during the year, thereby reducing the cost of Insurance.

For such dividends, certificates are issued subject to dividends of Interest until ordered to be redeemed. In accordance with the charter.

NOT unnatural curiosity may be said to have been the predominant attitude of mind of the cotton trade with respect to the great Cotton Loan Fund (to use its new official designation) with $135,000,000 at its command for loans upon cotton, of which Mr. Festus J. Wade, of St. Louis, was the father, but which has now been taken up by the Federal Reserve Board, acting not exactly under the law of its being, but in a kind of collateral capacity. As has been the case with virtually all of the plans for the relief of the hard-pressed cotton producers, the cotton trade has not been consulted about this, except casually. But it has had problems of its own and the best energies of its ablest problems enough of its own and the best energies of its ablest members have been required for the solution of these problems, without striving to intrude where assistance was not asked. With the great cotton exchanges closed because of the tangle of ante-bellum commitments impossible to be left to individuals to untangle, if general ruin in the trade were to be avoided, all the considerable cotton merchants of the country have been compelled to limit their own actual business to the merest day-to-day transactions, while they endeavored to set straight the affairs of the trade. Hence it has perhaps been as well that they were not called upon to give the benefit of their experience to the formulators of cotton relief plans, like this of the $135,000,000 Cotton Loan Fund. As they have had no responsibility in the matter, no blame can be imputed to them if it should in the end prove that Mr. Festus J. Wade, or the Federal Reserve Board, having the dazzling sum of $135,000,000 at their disposition, really accomplished no more with it than the King of France of story, with his twice ten thousand men, who succeeded only in marching up the hill and then marching down again.

The interest, then, of the cotton trade in the Cotton Loan Fund is as yet purely that of curiosity; and the main point of this curiosity is as to the character of the persons to whom it is expected that the $135,000,000 will be lent. There has not been a whisper to the effect that cotton merchants are supposed to borrow any of it. On the contrary, there has been a rather general understanding that there is no intention of placing this huge sum of money at the disposal of this class of persons, who are distinctly suspected of being inter-related in many ways with the detested speculators, or gamblers, on the cotton exchanges. In all governmental circles in Washington, whether congressional or administrative, the *mot d'ordre* now is that cotton speculators are taboo; that they must be kept afar off; and that any and every plan for the benefit of the producers of cotton, with which a governmental agency has anything to do, must be so devised that no opportunity is afforded for the speculators to have any use of it. This means that the cotton merchants also must be left out of account in the formulation of any plan of relief. For, strangely enough, the speculators have discovered that what best suits them is that which most closely conforms to the normal processes of trade. In the commerce in cotton, the speculators desire cotton exchanges just as much as do the merchants. Moreover, they perceive the advantage to themselves of all the devices for quick action, for the decisive meeting of new conditions that may come about, which the merchants have discovered and are accustomed to employ. So the speculators associate themselves as closely as they can with the merchants, and to the inexperienced eye they are indistinguishable from them. Certainly there are no eyes in Washington that can tell them apart. Hence, if there is money to be lent and the control of the lending is to be in governmental hands, it may be counted upon that the methods selected will be both without the advice of cotton merchants and lacking in consonance with the ordinary conduct of the cotton trade. So in the present case it has been evident that neither the original promoters of the scheme for providing a great loan fund for cotton nor the National Reserve Board, in its semi-public, semi-private capacity in connection with the matter, has paid any heed to the class of cotton merchants as possible borrowers from or through the fund. It follows that some other class of persons is expected to resort to the fund.

The detailed programme for the administration of the Cotton Loan Fund was given out in Washington on Tuesday of the present week. The really important part of it, of course, is that which deals with the actual loaning of the money upon the security of cotton. In the statement, however, the provisions that have to do with the general administration of the Fund and with the relations of contributing bankers to it are so much more elaborately set forth than are the requirements in respect of the loans to be made that the casual reader might easily get the impression that it has been deemed unnecessary to go into the latter question. There are appearances of an assumption on the part of the framers of the programme that all that is needed is $135,000,000 to be loaned on cotton and that the mere existence of this fund will draw borrowers in abundance.

It is hardly necessary here to go in detail into the terms of the subscriptions of the banks of the country to the Cotton Loan Fund, with the division of the subscribing banks into two classes,—Class A being banks from other States than the Cotton States and Class B being banks from the Cotton States; nor to describe particularly the certificates to be issued to the banks in these classes or the sev-

eral rights of repayment which attach to the certificates. In a sense it is a governmental curiosity, however, to have the Federal Reserve Board resolve itself into a private committee for the general administration of the Fund; to have this "Central Committee" appoint another private committee, the "Cotton Loan Committee," to which are delegated the powers necessary for the actual conduct of the business as a whole; and, finally, to have the "Cotton Loan Committee" appoint a whole series of private State committees in the cotton-producing States, with the power in their turn to appoint local committees, wherever they are needed. The consequence of this somewhat complicated arrangement must be that, directly or indirectly, the "Central Committee," which in composition is the Federal Reserve Board, will be dealing more or less extensively with itself in its capacity as the Federal Reserve Board. It is true, to be sure, that the Secretary of the Treasury has announced that the taking out of any currency in connection with the cotton loans is to be provided for under the Aldrich-Vreeland Act, over the administration of which the Federal Reserve Board has no direct control. Yet it is evident that all kinds of Federal Reserve Board questions must arise in connection with the matter, at least as regards the Southern banks which are expected to make the initial loans. In real truth, these questions will arise, probably on a very large scale in New York City, whither it is certain that a very large quantity of the surplus cotton will drift before the season is over, for warehousing and financing.

But, after all, this is aside from the main matter of which we have intended to speak. This matter is that of the probable or even possible borrowers who are to take advantage of the magnificent opportunity afforded them of obtaining a portion of the $135,000,000 contributed by the banks to the Cotton Loan Fund. Borrowing money on cotton is by no means the simple thing that borrowing money on stocks or other forms of property is. It is, for instance, a *sine qua non* of borrowing on cotton that the cotton should not be tied up in such a way by the conditions of the loan that the borrower cannot instantly take advantage of favorable markets when they come along. And this must be true not only of the entire amount of cotton pledged, but of any part of it. The owner of a lot of cotton may at any moment find that while he cannot advantageously sell the entire lot, yet there are in the lot one or more bales of a particular grade or quality for which the demand is strong and the price relatively very high. Freedom of access to the lot, so that these marketable bales may be renewed and either a corresponding part of the loan paid off or other bales substituted, is an indispensable condition of borrowing upon it, from the borrowers' point of view. And what is true of particular lots of cotton, owned by particular would-be borrowers, is true of the entire stock of cotton in the country, upon a great part of which the $135,000,000 of the Cotton Loan Fund is expected to be lent. This stock, even if it represents a great surplus of cotton which must be carried along for months or perhaps years longer than is customary, can never be a fixed and immutable body of collateral. Streams of cotton must be pouring into it and streams of cotton must be pouring out of it all the time. The owners of it must be continually busy with it, selecting it out into its various grades and qualities, withdrawing what can advantageously be sold and adding their fresh purchases or their more recent ginnings, one day paying off a part of their loans, with their accompanying warehouse and insurance charges and interest, the next day putting in new collateral and increasing their loans. Nothing could be more alien from all the requirements of the commerce in cotton than an arrangement under which 5,000,000 particular bales of cotton (the assumed surplus stock of this season) must be segregated from all the other cotton and permanently held without change of a bale until such time as the world's consumption shall have absorbed the free and unpledged supply and calls for this reserve at a satisfactory price.

Yet the machinery for obtaining loans from the Cotton Loan Fund, as described in the statement given out this week, appears to have been designed wholly from the point of view of keeping the cotton loaned upon stored away for a long period of time, immobilized in so far as the commerce in cotton is concerned, in order that it may be safe collateral for advances made upon terms convenient to the lenders, but supremely inconvenient to the borrowers. This can best be brought out by following an assumed specific transaction, of the kind most likely to occur, through from the procuring of the money by the borrower to the final repayment of the loan and release of the cotton that has served as collateral.

A farmer in Texas has 57 bales of cotton. He lives not far from Dallas, Texas, and is accustomed to do business with one of the banks there. He applies to this bank for a loan of 6 cents a pound, basis middling, on the 57 bales of cotton. He finds that he must put the cotton in an approved warehouse, taking out a warehouse receipt; he must also have the cotton insured against fire, obtaining a fire insurance policy; finally, he must in some way inform the bank of the grades represented in his 57 bales, presumably by having the cotton classed by an independent cotton classer and furnishing the bank with this classer's certificate of class. He must then make a note to the bank for the amount of money he desires or is entitled to borrow, and this note must run for a specific length of time. To the note he must attach his warehouse receipt, his insurance policy and, presumably, his grade certificate. The bank then forwards all these documents to the "Central Loan Committee," at Washington, which may approve or disapprove the loan. If it approves the loan, the committee makes the necessary arrangements in respect of Class A and Class B certificates with the banks subscribing to the Cotton Loan Fund, and holds the borrowers' time note, with the warehouse receipt and insurance policy attached, until the note falls due. One or more of the subscribing banks may use Class A certificates, on which this loan forms part of the collateral, as a basis of taking out Aldrich-Vreeland currency. And then, a month or two later, the borrowing farmer finds that he desires to sell 7 bales of cotton out of the lot of 57 bales. What is he going to do about it? He cannot get at his warehouse receipt, for that is in Washington. He cannot pay off part of his loan or cancel part of his insurance, for the loan in its totality runs for a fixed period of time. In truth, he can do nothing but sit still and watch his market pass, with his cotton immobilized until the expiration of his loan.

What is true in this specific case will be found to be true in virtually all the other cases in which cotton producers and, still more, cotton merchants desire to borrow money on cotton, in order that they may carry it comfortably until a favorable market comes. This being so, we cannot conceive that the practical results obtained through the Cotton

Loan Fund will be of other than the most trivial character. The sum of $135,000,000 available for loans upon cotton is splendid to look upon and to talk about; but when the arrangements for loaning the money are devised in such fashion that it is impracticable for owners of cotton, whether producers or merchants, to avail themselves of the offered money, all that can be said of the plan is that it is magnificent, but it is not war. *Arthur Richmond Marsh*

A BREMEN MERCHANT CONTESTS THE PROPRIETY OF PREVALENT AMERICAN OPINION ABOUT HE WAR

To the Editor of The Market World and Chronicle:

SIR:—With great interest I have read your article in THE MARKET WORLD AND CHRONICLE of September 12,—with special interest because you have touched a subject which has been on my mind ever since the war started, i. e. that almost universally the sympathy of the world is against us.

I will just try to go into your arguments and then give you my ideas about this special point. I think I have a right to do so and am able to undertake this, because I have lived in America a great many years; and during that time I did not live like a foreigner among your people, but as one of them,—in that way trying to study the life and the character of the Nation. In many ways I became a great admirer of the United States; in others I did not.

May I ask you: Upon what are your own ideas upon Germany based? How long have you lived in our country? And have you lived over here differently from most of the English and American people who come over here? I am sure you will say: "No; but I have read a great deal about Germany and have made this my special study." Then I shall have to ask you: Do you speak and read the German language fluently, and have you studied Germany through German literature, through German writers; or only through articles and books written by English or American writers? Your answer, I believe, will be: "I do not understand German, but so much is written about Germany in English that I ought to have a thorough knowledge of the country and the people."

From your article of September 12 I am able to perceive that you have only a one-sided knowledge of Germany, being like 99 per cent of the world. And why? Because 99 per cent of all foreigners who come to Germany, especially the English and the Americans, even if they have to live here for years, will not take the trouble of learning the German language thoroughly, which is absolutely essential in studying the Germans. If they are able to make themselves understood after several years, they think they are doing splendidly; and the ambition to go deeper into the beauties of the literature of the country is lacking in the 99 per cent I am speaking about. I have been back in Bremen now for fourteen years and have seen many cotton people come to Bremen, start in business and live here for years. Of all these I know of only one single case in which an American has learned the language fluently; and even he did not take the trouble to use this knowledge to read German literature and the deeper German writing.

Not only is the language a great wall around Germany and the Germans, but the disinclination of other nationalities to change their mode of living stands in the way of their mixing with the Germans, as they ought to do when they make this country their home and make their living here.

Your article centres in the one idea that the organization of Government in Germany is absolutely wrong; that Germany is divided up into different classes and that one class is suppressing the other,—beginning with the Emperor and the military party, ending with the director of a small cotton mill suppressing his workmen. Such a system is objectionable to other nations and against such a system the world has a right to fight, either with arms or with their wishes. You even go so far as to compare the freedom of our people with the people of Russia, and your conclusions are in favor of Russia. I must admit,—and I must ask you to excuse my expressing openly my opinion,—I am surprised that such a well educated gentlemen as you are should show such absolute ignorance of European and especially of German affairs; and that you, knowing how little familiar you are with the matter you write about, should publish this article in your paper, and in that way take upon yourself the responsibility of influencing the opinion of the people who read your paper.
